BUILDING AND BUILDERS.

The memorial-stones of a new Primitive Methodist chapel have been laid in Netherfield Road, Nelson. The new chapel will take the place of an iron structure, and is being erected to meet the growing needs of the district. Seven memorial-stones were laid.

For stealing and cashing a cheque for 100*l.* belonging to his employer, Mr Downs, a Walworth builder, Charles Hampton, a clerk, was sentenced to six months' hard labour at Lambeth.

At Coventry County Court a widow named Lydiatt claimed 187*l.* damages from Councillor Wincott, builder, of Coventry, for loss of her husband, who was killed in an accident at defendant's brickworks. The demand was for the amount of three years' wages of deceased. Defendant agreed to a verdict of 55*l.*, without costs, and the case was settled on those terms.

Foundation-stones of a Union Church, the long-desired home of the Amalgamated Baptists and Congregationalists of the growing township, were laid at Beeston on Tuesday last. The building, which, when erected, will accommodate 400 persons, and is estimated to cost 2,350*l.*, is being built, from plans prepared by Mr. C. N. Holloway, of Angel Row, Nottingham, by Mr. William Turner, of Beeston.

The foundation-stone of a new physical laboratory to be erected at a cost of 30,000*l.* in connection with Owens College, Manchester, was laid on Tuesday last. The building will be of the most modern character in style and equipment. There are only two laboratories in the world larger than it is to be—those at Baltimore, U.S.A., and Darmstadt, but the site purchased is large enough for extensions in future sufficient to make it even more spacious than they.

The Southport Pier Company have resolved to bring their structure up to date. They intend to set back and improve the entrance, to widen the whole length of the pier, with the object of having a double line of tramways, and to erect a spacious pavilion for dancing and variety entertainments. The plans of these improvements are being considered by a committee of the Corporation, and it is expected that the scheme will have their approval.

The Secretary of Aberdeen Chamber of Commerce has received from the Secretary of Aberdeen Joint-Railway Station a letter stating that progress is being made with the plans for the enlargement of the station, and that it is expected they will be sufficiently forward to admit of application being made to Parliament in the ensuing session for the necessary powers. A public meeting has been called for to-day to consider what steps ought to be taken to have the station extended.

The members of a Liverpool syndicate are now in Douglas with the object of promoting a new theatre for the town. At present there is only one theatre, the Grand, to meet the histrionic requirements of the multitudes of summer visitors, and there has long been a feeling that there is room for another. It is reported that the Pavilion on the Harris Promenade, which was formerly used as a music-hall, will be acquired for conversion into a theatre.

Bradford is indebted to Mr. and Mrs. Joseph Cawthra, of Horton Hall, for the addition of another institution to those it already possesses. The building, which is to be known as St. Catherine's Home for Cancer and Incurables, has been erected at a cost of 10,000*l.*, which amount has been given by Mr. and Mrs. Cawthra in memory of their son, John William Cawthra Briggs. The opening ceremony was performed on Saturday by Lady Frederick Cavendish before a very large assemblage of interested persons. Another institution opened in Bradford on Saturday was Dr. Barnardo's Home for Incurable Children. There is accommodation for twenty-five young people of the destitute and waif class, and admission will be absolutely free.

A slater named Robert Rodgers was seriously injured at a building in course of erection at the corner of Ingram Street and Montrose Street, Glasgow. He was employed at the building, but had left his work on the previous day. He returned for his tools, and was met on the fourth storey of the building by the foreman, who went to get them. He left Rodgers waiting for him, and shortly afterwards he heard a crash, and on coming down found that Rodgers had disappeared. He discovered him lying in a heap of rubbish at the foot of the building. Rodgers, who fell a distance of 80 feet, received injuries to his head and was also hurt internally.

The Dundee Established Presbytery, acting in co-operation with the members of the Dundee Church of Scotland Office-bearers' Union, are at present considering a scheme for church extension in various parts of the city. In the first place, it is proposed to have a stone church erected in Lochee Road in place of the existing iron chapel known as St. Thomas's Established Church. At the east end of the city there is a

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office: 175 Strand, London, W.C.

considerable congregation worshipping in Maryfield chapel in Morgan Street, but in view of the large amount of residential building within recent years and the consequent moving of population in that district it is believed that a large congregation could be formed. With this object it is proposed to erect a new church in the neighbourhood of the existing chapel, and to utilise the present building for hall purposes. Another scheme is the erection of a new church in the Blackness and Cherryfield district, where there has also been a considerable amount of building within recent years.

THE report of the public works committee submitted at a meeting of the Dudley Town Council on Tuesday last, states that Councillor Hooper and others associated with him have purchased a building estate between the Buttery Road and the recreation-ground, containing 17 acres or thereabouts, upon which it is contemplated to erect houses mostly for the artisan classes, and that they are prepared to sell to the Corporation a piece of land adjoining the recreation-ground, containing 7,000 square yards or thereabouts. The committee, having considered the offer and discussed the same with Mr. Hooper, are of opinion that the enlargement of the recreation-ground as proposed would be advantageous and a great improvement, and recommend that it be accepted on the following terms :—"That the Corporation purchase the land to be thrown into the recreation-ground at the amount of the accepted estimate for making the roads ; that the purchase-money shall be paid when the roads are made to the satisfaction of the borough surveyor, and when not less than fifty houses, yielding an annual gross rental of 600*l*., are erected and finished ; possession of the land to be added to the recreation-ground to be given on the adoption by the Council of these recommendations and a conveyance executed to the Corporation, and that the amount of the purchase be included in a future loan."

ANOTHER arcade is to be built in Birmingham, between New Street and High Street, independently of the one already projected by the City Arcades Company in connection with their scheme for erecting an arcade between Corporation Street and High Street. The plans, prepared by Messrs. Essex, Nicol & Goodman, provide for the construction of an arcade from New Street to the Louvre, in High Street, and joining at right angles the arcade about to be commenced by the City Arcades Company, between High Street and Corporation Street. Under the new scheme there will be three shops fronting New Street, with entrance to professional and other offices above, and fourteen shops in the arcade, over which are to be ranges of offices and showrooms. Provision has been made for a large café underneath the whole of the front block of buildings, with imposing entrance from the arcade and a staircase down from one of the New Street shops. The arcade is to be three storeys in height, and the passage will be covered with an ornamental glass roof. The interior elevation is to be faced with ornamental glazed faïence ware, while the elevation to New Street will be similar in style to the Louvre buildings. The Arcade passage is to be repeated in the basement as a kind of lower arcade, the shop-fronts in the upper portion being continued downwards, while narrow openings in front, protected by ornamental iron rails, will enable the goods exposed in the show-rooms to be seen from the upper passage. The shops in the lower arcade may be let independently or with the upper shops, and they can be approached by a spacious staircase near the New Street entrance. In order that as much daylight as possible may be admitted to the basement the floor of the upper passage will be formed of glass prisms, and the basement shops will also be lighted at the rear by skylights. The first section of the City Arcades contract is only from High Street to about half-way towards Union Passage, but as the Louvre Arcade is expected to be constructed at the same time there will be a complete arcade joining New Street with High Street in the shape of the letter L. The total cost of the new arcade is roughly estimated at 25,000*l*.

TRADE NOTES.

THE House of Nazareth, Cardiff, is being warmed and ventilated by means of Shorland's patent Manchester grates.

OWING to improved manufacturing facilities the United Asbestos Company are enabled to make important reductions in their prices for many of their principal designs in "Salamander" decorations. We see from the revised price list which they have forwarded to us that the prices are in some cases reduced by as much as 33 per cent.

AT Kilmarnock the Equitable Co-operative Society, Limited, have opened a new and extensive suite of premises in John Finnie Street and Dunlop Street. In addition to shops on the ground floor the building consists of a fine hall seated for upwards of 500 persons, and library-room, reading-room, offices, &c.

VARIETIES.

THE parish church at Wilmslow was reopened on the 29th ult. after restoration.

ST. HELENS (Lancs) parish church was reopened last week, after alterations involving an expenditure of about 800*l.*

A NEW technical institute at Wellingborough, which has been erected by the urban council at a cost of 3,000*l.*, exclusive of site, was opened on Thursday last.

DURING the progress of a boxing contest at Brock Street Hall, Bath, on Tuesday evening, the flooring, which also forms the covering of a swimming bath used in the summer months, gave way at one corner of the ring, where thirty or forty spectators were sitting or standing on forms and chairs. There was a terrible crash and a panic ensued, many rushing to the doors. The persons precipitated into the bath had a difficulty in getting extricated, and it was found that there were several injured, one being stated to have broken his leg.

AT Johnstone, N.B., the commissioners have just completed the extension of the buildings which was necessitated by the removal of a dwelling-house and the conversion of an upper flat into a suite of offices to accommodate the town clerk and burgh chamberlain A new public weigh-office has also been made adjacent to the town's buildings, and public weights put down so as to concentrate all the burgh work at the central buildings.

THE Rugby School Chapel has been reopened, after enlargement of the west end, as a memorial to the late Rev. P. Bowden Smith, an assistant master at Rugby for forty years. The part of the old chapel, built in Dr. Arnold's time, which was left in deference to the wishes of Dr. Arnold's old pupils when the chapel was rebuilt in 1872, has been removed, and the main building completed in keeping with Mr. Butterfield's designs, at a cost of 4,600*l.*

A SHOCKING fatality took place on Saturday last in the Abercorn Foundry, belonging to Messrs. Hannah, Donald & Wilson. John Dolan, labourer, who resided at 10 Caledonia Street, was employed clearing sand from underneath a condensing tank, when the supports gave way, and the tank, which weighed about 6 tons, fell upon him, crushing him to death. Deceased was about twenty-two years of age, and a native of Ireland.

THE quaint annual ceremony of toasting the memory of Sir Francis Drake, who, when Mayor of Plymouth, gave the town its first water supply, was performed on the 21st ult. for the last time, as the Head Weir, at which it has always been held, will by next year be submerged. After drinking to the pious memory of Sir Francis Drake in water, the company drank in wine the toast, "May the descendants of him who brought us water never want for wine."

THE Lords of the Committee of Council on Education have decided, at the suggestion of the Council of the Society of Arts, to hold during the autumn an exhibition of lithography in the buildings of the South Kensington Museum, on the west side of Exhibition Road. As lithography was discovered by Senefelder in the year 1798, the present is the centenary year of the invention, and therefore offers a suitable occasion for such an exhibition as is proposed. The Department will be assisted in the selection and arrangement of the exhibits by the influential committee, with some additional members, which had been already organised by the Society of Arts. It is proposed that the exhibition should be opened about November 1 and remain open for four months.

THE new stables at Perth Harbour, belonging to the Police Commission, which have been erected in connection with the manure depôt at the Friarton and the new culvert into which the water from Craigie Burn has been diverted, were formally opened last week in presence of a large number of the members of Town Council and burgh officials. The new depôt has cost about 5,000*l.*; the stables, which have accommodation for sixteen horses, 2,500*l.*, and the culvert 1,500*l.* In connection with the proceedings ex-Bailie Alexander, convener of the health committee, was presented with a gold key and a silver salver bearing a suitable inscription.

THE premises of Messrs. F. McNeil & Co., patent felt manufacturers in Lamb's Passage, Bunhill Row, E.C., sustained considerable damage by fire in the early hours of Saturday morning last. The firemen had to burst open the doors

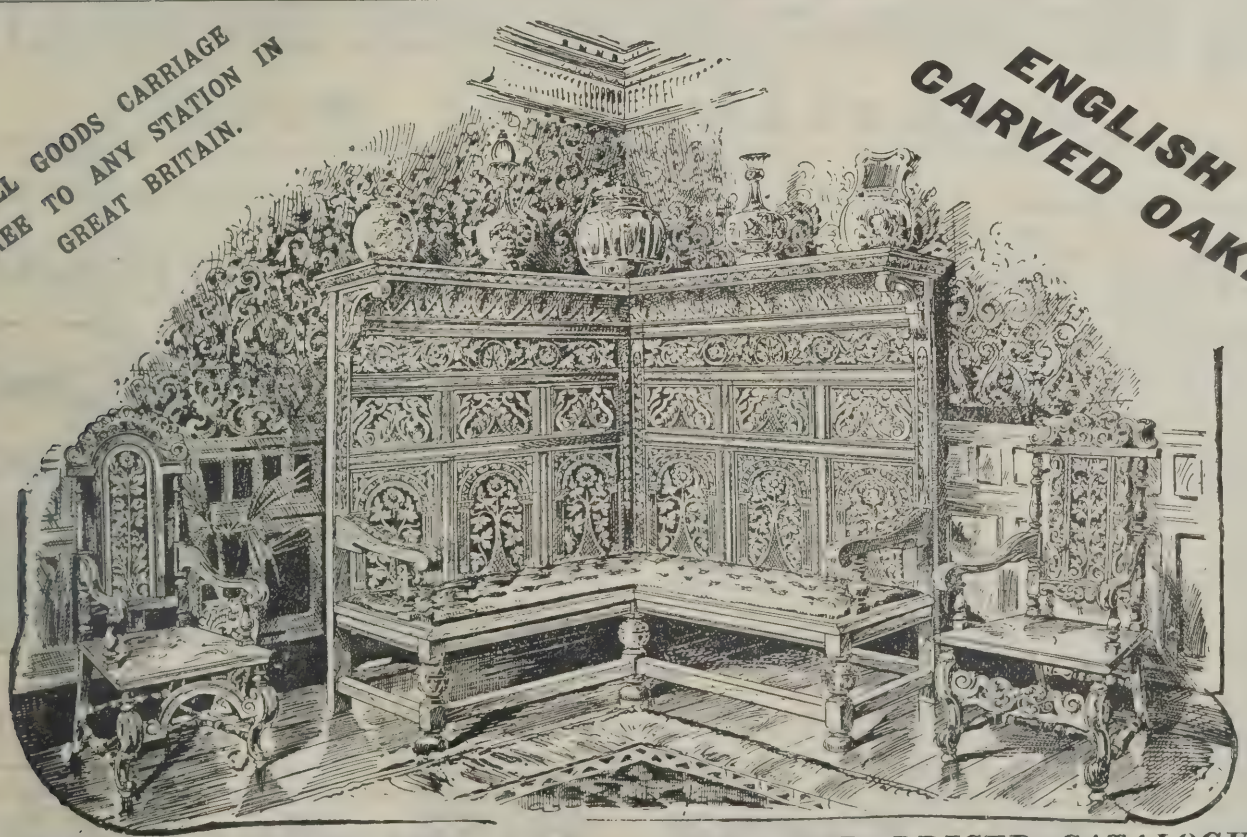
before they could bring water to bear upon the fire, which was burning fiercely on the first and second floors, and threatening a second building belonging to Messrs. McNeil. Thanks to the strenuous efforts of the brigade, under the personal direction of Commander Wells, R.N., the second structure was saved from total destruction. The fire was overcome about daybreak.

THANKS to the liberal policy which they have consistently pursued, and the admirable management of Mr. Charles Morton, assisted by his ubiquitous and courteous lieutenant, Mr. Philip Yorke, the directors of the Palace Theatre, Limited, were enabled to announce to their gratified shareholders in meeting assembled the payment of a dividend of 13 per cent., which, with the interim dividend of 7 per cent. already paid, brings up the payment for the year to the respectable rate of 20 per cent. At the same time they carry forward a sum of no less than 15,000*l.*, against the 4,600*l.* carried forward last year. This being the jubilee year of Mr. Morton's connection with the "halls," the sum of 250*l.* was unanimously voted as a little memento of the occasion.

"SELL'S Commercial Intelligence," to be published weekly, will contain careful summaries of the valuable information contained in the Foreign Office and consular reports, colonial statements, American consular and other reports, German official and trading reports, and other information of value to manufacturers and merchants. An effort will be made to obtain from the Government departments prompt publication of reports corresponding to the American daily publication. By direct communications with America, Germany and the colonies efforts will be made to place before the public early intimations of trade movements and new departures, such as in the ordinary course would not be published for months.

AT the Aberdeen Town Council meeting Lord Provost Mearns called attention to the interesting fact that with the passing of the minute of September 19, 1898, there was now completed the 500th year of the continuous record of the Council's proceedings. The first minute in the record was dated September 30, 1398, and narrated the appointment by the whole community of the alderman or provost (William Chalmers) and four bailies, one of whom was Robert Davidson, afterwards Lord Provost, who fell at Harlaw. It also narrated the appointment of four standing committees of the time, namely :—(1) Appraisers of meat ; (2) the tasters of wine ; (3) the tasters of ale, and (4) the measurers. The first volume, commencing with the minute of September, 1398, was on the table, and there was a marked contrast between it and the printed minute which the Council had just passed. Aberdeen stood unique in this respect, for no other burgh of importance had so complete a record of its proceedings.



VANBRUGH HOUSE, in Whitehall Yard, which was built by Sir John Vanbrugh in 1796, and familiarly known as "the Pill Box," in consequence of its diminutive size, has been demolished. Prior to 1831 it was the residence of Lord Stuart de Rothesay, but in that year it was taken over by the then recently established United Service Institution, which, together with its famous museum of naval and military relics, was housed there until 1895, when the Queen granted the use of the historic banquetting house of the Palace of Whitehall. The old building, which stands on the site of the quarters allotted to the officers of the Jewel House, has now been demolished to make room for the erection of the new War Office, on ground formerly occupied by Carrington House.

A CONVENT chapel which the Little Sisters of the Poor have erected within their home for indigent old people in Gilmore Place, Edinburgh, was formally opened on the 29th ult. The church, which is capable of accommodating about 300 persons, is a not unworthy addition to the Roman Catholic places of worship in Edinburgh. Erected in Romanesque style from designs prepared by Mr. J. M. Monro, architect, Glasgow, its ground plan is a simple oblong with apsidal recess, but by reason of the height to which the walls have been carried, the roominess of the circular-arched roof, and the number and exceptional height of the side windows, the interior presents an unusually cheerful and lightsome, though at the same time quite unpretentious, appearance. In the planning of the building particular care has been taken to adapt it to its environment, and to place it in direct and convenient communication, by corridors and otherwise, with the various parts of the institution. The cost of the church is about 3,000*l.*

THE new High School at Woodlands, Falkirk, was opened on the 3rd inst. by the Marquis of Lorne, K.T., M.P. The building is of lofty and dignified proportions, with well broken elevations and skyline. The principal features of the main front, which has a northern exposure, are three gables, which are treated in a free manner with transomed windows, surmounted by carved pediments and flanked by pilasters. The centre gable is of a more ornate character, with carved pedi-

Estate Department.—Auctions and Private Sales, Valuations, Lettings, Surveys, Repairs, and Decorations

ments and scrolls, a clock opening forming the central feature. The east and west elevations are treated in a similar manner, with gables at each end. The entrances are in these elevations, and are approached by flights of steps, flanked by stone balustrades. The ground-floor of the school is occupied by the junior department, the classrooms being six in number, three of these, however, being divided by glass sliding partitions, giving altogether nine classrooms. In addition to these rooms there is ample cloak-room and lavatory accommodation, besides a private room for the headmaster of the junior department. On this floor there is also situated the gymnasium, as well as the rector's business room. The school is planned on what is known as the central hall system, and by means of sliding partitions the central hall, junior department, hall and gymnasium can be thrown into one spacious apartment on special occasions. On the upper floor of the school are situated the classrooms of the senior department, and consist of English, commercial, mathematical, arithmetic, classical, modern language, sewing and cookery rooms, and chemical and physical laboratories, with large lecture-room. Space has been found for art and music rooms by raising the building to three storeys in height at both back and front. On this floor are also situated teachers' private rooms, as well as lavatories for the senior pupils. The classrooms have been designed and fitted on the most approved modern principles, and are large airy apartments, and being heated by low-pressure hot-water pipes, an equable temperature will be maintained. An entirely new departure in Falkirk is the teaching of joinery, &c., in school; but in secondary education schools, such as the High School, this is now compulsory under the Education Code, and in accordance therewith a workshop has been provided in the basement of the building of sufficient size to accommodate a class of twenty-five pupils. The accommodation of the school is:—Junior department, 426; senior department, 515; total, 941. The playgrounds are of large size, and two ash tennis courts are provided. The total cost of the buildings will be about 13,000*l*.

RAWMARSH parish church, by means of judicious restoration, has been transformed from an old-fashioned, inconvenient and unattractive interior into a modern, up-to-date edifice of much beauty. Important alterations and additions, as well as a thorough restoration scheme, have been carried out from plans and under the superintendence of Mr. Joseph Platts, architect, &c, of Rotherham and Rawmarsh. The work has cost upwards of 2,000*l*. The scheme of renovation embraced the erection of a new chancel, the refixing of the old stained-glass window, the removal of the gallery, and reseating, the provision of new windows, the building of a vestry and organ chamber, in addition to the thorough repair of the nave. It is rather more than two years since Mr. Platts pronounced the roof of the nave to be unsafe, his investigation proving most of the timber to be decayed. With the imperative demand for safety it was necessary to comply, and at first it was not intended to do more. A new ceiling of pitch pine, roofed with Westmoreland slates, was put in, and during the course of the work it was discovered that the walls of the clerestory were damaged. They were therefore repaired. The old galleries were taken out, and then it was seen that one of the stone pillars of the nave was cracked down its entire length, and a new one had, of course, to be put in its place. The new chancel, which is much larger and more elegant than the chancel it supersedes, is of octagonal shape, and has been arranged to fit the old stained-glass window given by the family of the late Sir Wm. V. Ross Mahon, Bart., the former rector. The floor is laid with encaustic tiles, and new altar standards and rails have been provided. The nave has been newly floored and seated with open benches of selected pitch pine, slightly stained oak colour, with worked and traceried ends. The hexagonal pulpit is of the same material as the pews, and is supported by traceried pillars, with open work above. All the internal stonework has been cleaned of the whitewash which formerly disfigured it, and new windows of cathedral glass have been inserted. The new chancel arch is of Roche Abbey stone with old English carved capitals. This rearrangement of the nave has affected the accommodation, but some of the places lost by the removal of the old and not very sightly galleries have been made good by the larger space left in the nave by the withdrawal of the choir-stalls to the chancel. It is estimated that the church will now seat about 400 persons. The alterations have required a rearrangement of the heating system, which has been renovated and improved.

THE ancient border-parish church of Lidgerwood in the presbytery of Earlston, which has been closed for about eight months, during which time it has been submitted to a process of complete restoration, was reopened on Sunday, the 25th ult. The alterations on the church at first contemplated were confined to interior improvements, and the restoration of the chancel to the extent of opening up the arch, giving it a roof and floor and other details. The work on the church was well advanced when an offer was made by Mr. W. van Vleck Lidgerwood, London, to restore the chancel at his own expense

if done to his approval. This generous offer having been accepted, the building committee thought it advisable to extend their operations and make the church exterior in keeping with its Norman chancel, and this accordingly has been done. The pointed Gothic porches and windows have disappeared; windows have been reconstructed and new Norman windows made, including a circular one in the dead wall of the west gable seven feet in diameter with ten lights. A Norman porch has been built for the south entrance. The chancel has been from the first shut off from the church as useless for the reformed service; the arch was built up, and has remained so ever since. The building was partially dismantled and unroofed to make a private burial-ground, and this has fortunately preserved it from destructive alterations. The only material alteration seems to have been the removal of the gable and making a wide entrance door to the burial-ground. Apparently the building has suffered more from the damp and vitiated air of the church than from any mutilating alterations. The details which remain, however, amply justify the restoration as an interesting example of the early Norman of the twelfth century. The archway has been opened up, the gable restored with a circular light, 3 feet diameter, a corbel eaves course laid for north and south walls. The old windows, which are only 3 feet by 8 inches, have been opened out, and another made to match them where the door to the burial-ground had been broken through. The roof is of the best British oak, with ceiling of the same material formed within intersecting timbers of the roof, which are moulded and have short hammer beams, resting on two massive beams carried on four large pillars, which had been built with the walls at the corners. The chancel is about 17 feet square. The floor is laid with a fine pattern of encaustic tiles; the space under the arch is paved with polished stone, and a border of polished pavement forms a border beyond it for the wood floor of the church. The glass of the windows is from designs by Messrs. Ballantine & Gardner, and these are executed in pure mosaic of the richest coloured pot-metal glass. The circular light represents our Lord as "Light of the World," and the three lower windows have each their own Scripture floral emblems. Owing to the depth of colour and the entire absence of reflection from the dingy discoloured walls, the aspect of the interior of the chancel, as seen from the church, was to many eyes disagreeably dark. With the view of remedying this defect, and still retaining the stained-glass, the lower windows are made to open, and leave the clear glass only outside. The walls, which still retain some patches of the original creamy-white decoration with diaper in red, are painted the same colour with water-glass distemper, leaving untouched both the old pigment and all joints of the masonry. The walls thus reflect as at first the light of the brightly-lighted church, and it may not be necessary even to throw back the stained-glass when light is good. Mr. Lidgerwood has also provided handsome oak chairs for the twenty-eight sittings allocated in the chancel. The works have been carried out from plans by Messrs. Hardy & Wight, architects, Edinburgh.

ELECTRIC NOTES.

THE demand for electric lighting in Edinburgh is an ever-increasing one. Throughout the year arrangements have had to be made for the supply on an average of 1,500 eight-candle-power lamps per week. At Tuesday's meeting of the electric-lighting committee it was reported that the applications for the fortnight included a total of 3,196 eight-candle-power lamps.

AT the St. Pancras Vestry's meeting on Wednesday, Dr. Walter Smith, chairman of the electricity committee, reported that the total revenue for the half-year ending June 30 last was 17,408*l.* 17*s.* 3*d.*, an increase of 3,088*l.* 2*s.* 5*d.* upon the corresponding six months of last year, yielding a net profit of 1,166*l.* 6*s.* 7*d.* The total profit for the past eighteen months was 2,883*l.* 13*s.* 9*d.* But for expenditure on mains, which would not recur, and the reduction of the current to the consumer, the profit would have been 1,000*l.* or 1,500*l.* more. Dr. Smith regarded the last half-year's working as very satisfactory, and Mr. Rhodes said he had no doubt that if the vestry sold their electricity enterprise to-day they would get for their 210,000*l.* capital invested 50,000*l.* profit. The object of the vestry was not so much to make a profit out of the undertaking as to allow the parishioners to have the electric light at a price cheaper even than gas, and to supply the public lighting at cost price.

FOR some time past the electrical tramcars of the city of Utrecht have made their journeys straight across the middle of the venerable cathedral. This curious development of "up-to-date" traffic certainly needs some explanation. Utrecht Cathedral was built in the thirteenth century and stands upon the site where the ancient mother church of the Trajectum ad Rhenum was built by our apostolic fellow-countryman the English St. Willebrod about the year 720. During the great storm of 1674 the roof of the gigantic nave fell in, and it was

Office: 175 Strand, London, W.C.

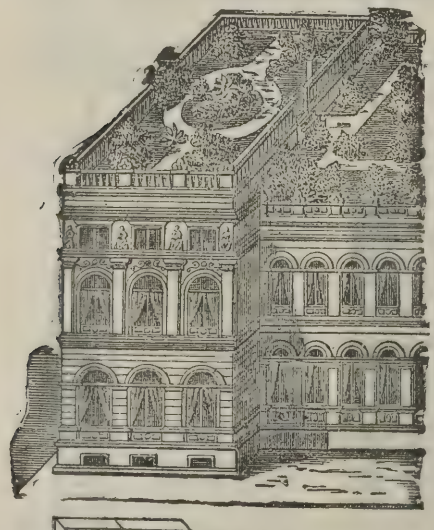
never rebuilt. For two centuries the choir at the east end and the magnificent tower at the west end, over about 300 feet high, have continued detached by a wide interval betwixt the two. The practical Hollander turned the gap into a street, along which the lines of the electric tramway are now laid.

A LIVELY scene was witnessed at the last meeting of the Eastbourne Town Council, under the presidency of the Duke of Devonshire. When the scheme, originated by Councillor C. F. Simmons, for utilising the refuse destructor for the supply of the electric light came on for discussion, Councillor Maude asked whether those interested in the gas and electric-lighting companies were entitled to vote. The Town Clerk replied that they were not, and seven members then withdrew in a body. An animated debate followed, and it was stated that in respect of public lighting the scheme would yield a profit to the ratepayers of 1,500*l.* a year, even after setting aside 750*l.* a year as a special depreciation fund. It was decided to apply for a provisional order, and to offer to buy up the electric lighting company's undertaking on fair terms.

AT the monthly meeting of the Liverpool City Council, which was held in the council-chamber at the Town Hall on Wednesday, Mr. Petrie moved the adoption of a recommendation of the generating stations committee to the effect that the tender of Messrs. Morrison & Sons, Wavertree, for the erection of an electric power station at Pumpfields, Vauxhall Road, in accordance with plans and specification, and at the schedule of prices submitted by Messrs. Morrison & Sons, be accepted. Mr. Beloe stated that unless this station were promptly erected the city would be in a serious position for the lack of electric power. Consequently he failed to understand why the committee had deferred its erection until the last moment. The result of this haste was that they had been compelled to let the contract at a schedule of prices which almost meant letting it at an unknown price, whilst it left open a great margin for juggling.—Mr. Fletcher inquired at what date the building was likely to be completed.—Mr. Petrie stated that the land had only been in the possession of the lighting committee about two months. They were certainly in a great hurry to complete the contract and that was the reason why they had let the contract in this way. They had received schedules of prices from various contractors, and Messrs. Morrison & Sons' was regarded as the lowest. The estimated cost was 35,000*l.*, and the building was expected to be completed in nine months. He assured Mr. Beloe that there was no likelihood whatever of jobbery or corruption.

HEALTH EXHIBITION, BIRMINGHAM.

THE Seventeenth Exhibition of Sanitary Apparatus, Appliances, and Articles of Domestic Use and Economy, now being held at Birmingham in connection with the autumn Congress of the Sanitary Institute, was opened on the 27th ult., and will not close until the 22nd inst. In regard alike to the number and excellence of the exhibits, it shows a satisfactory advance on its predecessors, while the number of visitors who have so far attended it leaves little room for unfavourable comparison with former years. If among the exhibits there is no striking novelty to arrest attention, it may be said that the display is characterised by all-round excellence in design, quality and finish, and that the general tendency to improvement in the various manufactures and wares is consistently maintained. As the various exhibits are for the most part already familiar to our readers, we do not think it necessary to give an exhaustive description or criticism, and the following brief epitome will doubtless suffice to give an adequate idea of the scope of the show.



At Stall No. 2 Messrs. Shanks & Co. have on view their "Fin de Siecle" parallel-sided bath, metallic enamelled, rouge royal inside, decorated outside; their "Perfecto" bath porcelain enamelled white inside and decorated white and gold outside; a "Perfecto" bath, vitreous enamelled inside and decorated outside; a "Modern" bath, metallic enamelled inside and decorated outside; a "Fin de Siecle" taper-sided bath, porcelain enamelled inside and decorated outside; and other of their well-known makes of baths, lavatories, &c.

Mr. George Jennings (No. 3) shows a roll-edge porcelain bath fitted with new "Duplex" supply and sanitary waste valve arranged for public or private baths; it is also adapted for asylum use; a cabinet stand fitted with new "Duplex" supply and sanitary waste valve; a specially arranged hospital sink and bed-pan washer; and a "Riker" system American interchangeable lavatory.

Dr. Quine's patent sanitary ash-bin, with improvements, and Dr. Quine's patent damp courses for walls are shown by the Pendleton Sanitary Engineering Co., Manufacturers, 1 Leaf Square, Pendleton, Manchester.

Messrs. Hughes & Lancaster, manufacturers, 47 Victoria Street, S.W., show a model of Fischer system of water filtration at stall No. 45. The Fischer patent stone filters, whilst embracing the advantages of sand filtration, utilise them to better effect. Sand has been retained as the filter-

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.
THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
28 VICTORIA STREET, WESTMINSTER, LONDON, S.W.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

ing medium, but it is employed in a much more compact form. The materials used in the manufacture of the Fischer filter plate are carefully washed to free them from clay or earthy matter, which it is well known are liable to get stopped up, and the plates are burnt at the high temperature of 1,800 to 2,100 F. It is claimed that an installation on the Fischer system only occupies one-eighth of the space required for a sand filter of equal filtering capacity. Here is also a model of the Shone hydro-pneumatic ejector for dealing with the sewage of low-lying and flat areas, which cannot be effectually dealt with by gravitation alone; also for raising water, sludge, chemicals and hot fluids, &c.

The Leeds Art Pottery and Tile Company, Limited, make an artistic display both of faïence and pottery. Foremost amongst their exhibits of faïence work is a piece of wall-tiling similar to what they are now executing, with special treatment of piers and arches, in the new building of the Westminster Fire Office, of which Mr. Thomas Mundy is the architect. It consists of a dado about 7 feet high of plain and embossed tiles of a soft brown tint, having a frieze with claret-brown Renaissance ornament on a flesh-coloured ground. The filling above is pale cream surmounted by a frieze with pale blue flutes, mouldings and cornice in light brown. Anything more charming could hardly be imagined. The same refined artistic feeling pervades the arrangement of the colour schemes of the numerous panels, tile dados and other faïence work shown. The modelling is everywhere good, and some of the figure panels must have been modelled by artists of talent and experience. Of special interest in connection with this exhibition, the Leeds Art Pottery and Tile Company are showing a large number of special tiles and a faïence dado similar to what they used for the tile and faïence work at the new Birmingham General Hospital, which we described in one of our former issues.

The Adamant Company's exhibits comprise Opaline, a substitute for glazed bricks or tiles; fibrous plaster enriched, in which the stand has been erected; fibrous slabs, as used throughout the New General Hospital, Birmingham, in their effective system of ventilation; "Granolithic," for staircases, cills, heads, either moulded or plain, and for forming pavements and floors, especially suitable for stabling; fireproof flooring, &c.

Messrs. A. R. Dean, Limited, Birmingham, show their patent Kensington syphonic closet, in action in various patterns. The special advantages of this closet are that it has a water surface of 9 or 10 inches or thereabouts, a nice appearance, and may be thoroughly depended upon in action; it cannot be syphoned out, nor the water seal broken; it is easy to fix, and is supplied in earthenware, with lead outlets, or the trap wholly in lead; the water and soil are discharged *en masse* from the basin (as is the case with valve closets) in exactly 3½ seconds, thereby thoroughly flushing the drain at each action; there are no valves, puff-pipes or other contrivances in connection with this closet, consequently it cannot get out of order, and so long as the flushing power is maintained it will last a lifetime. It is made in two pieces, exactly as the ordinary closet-pans and traps, therefore a new basin can be fixed at any time; it will also suit left or right handed, or straight outlets, according to the position of the soil pipes. The company also exhibit some capital specimens of the "Well Fire," a fireplace which gives a bright, cheerful and economical fire, and as the prices range from 65*s.* to 50*l.*, it will be seen that the range for choice of design and material is a pretty wide one.

On another stand the same company show as fibrous plaster manufacturers and decorators. Here is given a practical demonstration of the designing and manufacture (through its various stages) of fibrous plaster decoration, such as has been largely employed in the interior decoration of innumerable theatres, music-halls, restaurants, winter gardens, art galleries, &c.

Johnson's Sanitary Appliances, Limited, have a display of their patent gulleys, and Price & Johnson's patent lifting and locking apparatus for gulley grates and frames, lamphole covers, manhole covers, side entrances, telephone and telegraph street covers, patent travelling hinged cover for manholes, lampholes, telegraph and telephone, side entrances, gulley grates, &c. The advantages claimed for this cover are that it is much readier and easier to fix or take out, the possibility of the cover becoming fast in the frame is very remote, if not absolutely non-existent. The covers, after the cleansing process is done, may be allowed to fall down without the slightest risk of breaking them.

The Silicate Paint Company (J. B. Orr & Co.), Limited, show specimens of their sanitary durable and washable water paint "Duresco;" Charlton enamel paint; Charlton white; permanent Oriental red; silicate petrifying liquid, for preserving buildings from decay, and "Lithosote," tinted to match any decayed stone, brick or cement building exterior.

At the ornamental stand (No. 75) of the Welsbach Incandescent Gas Light Company, Limited, there is a brilliant display of the latest novelties in burners of which they are now

making a large variety, and the numerous fittings and shades and globes produce a very pleasing and artistic effect.

Messrs. J. L. Wade & Co., Limited (No. 87), have two of their disinfecting tanks for use in water-closets and urinals, also in road-watering vans, insuring a regular supply of the disinfectant—a hygienic protection, practically securing the user an immunity from typhoid, diphtheria and other diseases due to drains.

Messrs. Sissons Bros. & Co., Limited, show specimens of "Halls," sanitary washable distemper; and Messrs. Burn Bros. show their special iron drain-pipes, inspection chambers, branches, bends, traps and gullies, patent baths, with anti-flooding overflow, &c.

Among other exhibitors whom want of space prevents our mentioning at length are:—Messrs. William Eggington, Birmingham (portable sewer-gas extractor and destroyer, in conjunction with sewer disinfector). The Septic Tank Syndicate, Limited, Exeter (model of installation, consisting of septic tank and five filters). Farrer, Barber & Co., Birmingham (automatic tanks, automatic flushing multiple closets, &c.). S. Dibble & Son, Birmingham (a sink and automatic waste water flush closet). Joseph Sankey & Sons, Bilston (steel-clad, copper-lined bath, &c.). L. Hugh Bristowe & Co., Limited, Westminster (portable plant of Riddell's patent filter). Rowe Bros. & Co., Birmingham (sheet lead, lead water-pipe, composition gas-pipe, &c.) Evered & Co., Limited, 35 Drury Lane, London (new patent pedestal valve closet with afterflush syphon cistern, in action). Adams & Co., Birmingham (an installation of Adams's patent automatic sewage lift, in operation, &c.). Day's Automatic Waste Water Closet and Sanitary Pipe Syndicate Company, Limited, Wolverhampton (Day's automatic waste water closet (the Stafford). for single closets, in section). Mould's Patent Boiler-Bath Company, Birmingham (a new patent boiler-bath, for small villas and workmen's dwellings). John Jones, Chelsea (drain and cistern stoppers, bag and screw expanding, drain-testing apparatus, &c.). Martineau, Beames & Madeley, Limited, Birmingham ("Vortex" patent Valveless Syphon cistern, in iron enamelled Madeley's patent). Plant & Co., Birmingham (baths, &c.). H. Pullen Candy, Manchester (automatic self-propelled distributor, for delivering sewage). Gaskell, Chambers & Foulkes, Birmingham (closets and sanitary ware). E. & T. Underwood, Birmingham (automatic deodoriser, for disinfecting and deodorising water-closets). A. Barraclough & Co., Limited, Heckmondwike (Eureka tin and asbestos-lined lead water pipe). The Sterilite Filter Company, Bury, Lancs. (filters). Thomas Ash & Co., Birmingham (ventilators and chimney tops). Major & Co., Limited, Hull (disinfectant fluids and powders, &c.). Oates & Green, Limited, Halifax (patent stoneware truinvert pipe, 12-inch, with double seal joint, and section showing joint when made; stoneware pipes various, &c.). Johnson's Sanitary Appliances, Limited, Birmingham (Johnson's street and other gullies). Arkinstall Bros., Birmingham ("Simplex" cinder sifters and dust bins, baths, &c.). "Ronuk," Limited, Upper Thames Street (sanitary polishes). W. G. & L. England, Barnsley (patent reversible and sliding sash windows). James Jones Aston, Birmingham (reversible window, with lines and weights). Major R. F. Ballantine, Manchester (instantaneous water heater). F. Braby & Co., Limited (hot-water tanks). The Eclipse Brass and Copper Company, Limited (instantaneous domestic water boiler). The "Cannon" Hollow-ware Company, Limited, Bilston, Staffs. ("Porceliron" sanitary ware). Walsall Electrical Company, Limited, manufacturers, 57 Bridge Street, Walsall (gas engines, switchboards, &c.). The National Gas Engine Company, Limited, Ashton-under-Lyne (gas engines). Ferrybridge Foundry Company, Ferrybridge, Yorkshire ("Fryston" ranges). Samuel Smith & Sons, Limited, Smethwick (self-setting cooking range). A. B. Coleman, Aston, Birmingham (working models illustrating the circulation of hot water). Bayliss & Inman, Birmingham (samples of rustic work), &c.

The exhibitors number upwards of two hundred, and, as the majority of the stalls are attractively arranged, the interior of Bingley Hall offers a bright and, at the same time, a business-like appearance which reflects great credit on all concerned.

The following is a list of the prizes awarded to the exhibitors by the committee:—

Silver Medals.

Adams & Co. (Adams's automatic sewage lift). The Cannon Hollow Ware Company (enamelled cast iron). J. Defries & Sons, Limited (Pasteur Chamberland filter). J. Defries & Sons, Limited (Equifex pressure disinfecting apparatus). Ferrybridge Foundry Company ("Fryston" range. Hughes & Lancaster (Shone's hydro-pneumatic ejector). J. Stott & Co. (mercury gas governor).

(spiralvent chimney-top). Sterilite Filter Company (sterilite filters). Sutton & Co. (quarries for heating drying sheds). Twyford's, Limited ("Twycliff" syphon closet.

WELLINGBOROUGH TECHNICAL INSTITUTE.

THE above Institute was opened on the 29th ult. It has been erected from the joint designs of Messrs. Brown & Fisher and Messrs. Sharman & Archer in Church Street, on the site of some old tenements belonging to the town, and the carrying-out of the work has led to a great public improvement by the widening of what was hitherto a narrow and inconvenient thoroughfare. The building has a frontage to the street of about 60 feet, and the front is built of pressed bricks with dressings of Derbyshire and Weldon stone, and a large overhanging cornice. Entrance to the Institute is made through an arched doorway, approached by six stone steps and decorated with stonework. At each side of the arch is a three-quarter Ionic pilaster, and above this is an ornamental cornice and curved pediments. The words "Technical Institute" are carved in the stonework over the door. Folding-doors give admission to the entrance-hall, on the left of which is a large lecture theatre measuring 35 feet by 25 feet, and with a height of 14 feet. This room will accommodate sixty-two students at dual desks on a step gallery. Near the centre is a lecturer's table, fitted up with all the requisites for chemical and physical lectures. At the back is a large black-board and a screen for lantern illustrations, whilst in one corner is fitted up a fume cupboard. This room is also to be used for the popular lectures, for which the accommodation can be increased to 120. Adjoining is the chemical and physical laboratory, a spacious room 20 feet square, fitted with benches for twelve students, and complete with water and gas apparatus, fume cupboard, &c. Further on to the left of the entrance-hall is a room for the principal of the Institute, Mr. Clarence H. Creasy, fitted with benches, shelving and appliances for experiments. In the basement is a large room 35 feet by 25 feet, which has been fitted up with benches specially designed by Mr. E. Swaysland, the instructor for practical work in boot and shoe manufacture. Here, too, will be carried on carpentry, wood-carving, plumbing and all kinds of manual training, as well as the cookery classes. At the back of this room are two classrooms for the teaching of shorthand, type-writing, French and German, and dressmaking. Ascending to the first floor we find the elementary art room, 35 feet by 21 feet, and well lighted from the north by four large windows. The walls of all the rooms have been decorated in tints, and rising to these is a brick painted dado. Regard has also in all parts of the building been paid to the efficient lighting of the rooms for the special objects in view. The rooms are heated by means of ornamental radiators placed in the window recesses, through which warm air is allowed to pass and the vitiated air is carried off by specially constructed ventilators and flues in each roof. The staircases are constructed of patent Victoria stone, and to these have been fitted an ornamental iron balustrade. The hall floor is laid *in situ*, and the basement floor is of Excelsior stone, manufactured by Mr. Thompson, of Finedon. The building stands back 5 feet from the street, and along the front runs an ornamental palisading. The contractor for the building was Mr. William Stevens, of Park Street, Wellingborough.

THE WORKMEN'S COMPENSATION ACT.

AT the meeting of the Incorporated Law Society at Swansea on Tuesday, Mr. J. H. Cooke, Winsford, Cheshire, read a paper on "The Workmen's Compensation Act 1897." He described the Act as a measure which would at least have a tendency to create a little more thought for those who toil, without any serious deprivation to others possessed of the "wine and oil." The Act, however, had admittedly some dangers. Looking at it as a lawyer, it seemed to be as full of litigation as the famous Statute of Frauds, and its short provisions would cost many a golden sovereign per letter before they were finally construed by the courts of law. He examined with some minuteness the operative provisions of the measure, and illustrated by many possible cases the difficulties, the apparently illogical consequences and the serious questions which might arise under it, and concluded by offering the following suggestions to employers :—First, consult a solicitor of experience as to whether the whole or what portion of your workmen are under the Act. Second, insure against the liability. The premium will probably average 6*s.* to 10*s.* per 100*l.* of wages paid per annum. Third, define by printed regulations or agreement the duties of each workman or set of workmen, restricting the work connected with the most dangerous part solely to a certain section of the most skilled workmen, and forbidding others to interfere or be on that part of the works. A breach of such regulations or agreement, if strictly drawn, might, and probably would, be construed as "serious and wilful misconduct," thus disentitling the workman committing the breach to compensation. Fourth, remember that workmen who have no dependants receive least compensation; sometimes, however, they are most careless. Fifth, the Act forbids contracting-out, except by a scheme approved by the Registrar of Friendly Societies, but it does not appear to forbid an employer requiring a workman to contribute to an insurance fund, and inasmuch as the workman receives the benefit of the compensation, it seems only reasonable that such a proposition should be favourably entertained by all right-minded men. Such a course was, he believed, adopted in the United States. Sixth, employ strong able-bodied men as far as possible, and obtain a medical certificate of good health. Finally, whilst many might dislike the provisions of the Act, might imagine trade would decline by reason of its extensive operation, the sting might always be rendered innocuous by a wise and not very costly insurance.

The Mayor of Swansea made some general remarks upon the paper, which had a special interest in the coal-mining districts of South Wales. It was very much open to question whether colliery employers, at all events, could insure against

the operation of the Act by insurance at a comparatively small cost. The great insurance companies required a premium which represented a very serious tax upon the industry, and he moved a resolution recommending that in any future legislation the employer should be penalised only for such accidents as he might have guarded against by reasonable care and forethought, compensation for all accidents not so caused being borne by a national fund.

Mr. W. T. Rogers, Liverpool, seconded.

Sir A. Rollit, M.P., pointed out that the resolution would restore the old law as it existed from the time of Charles II., and he rather doubted the wisdom of the Society attacking recent experimental legislation and proposing a complete reversal of it.

The resolution was carried.

PROTECTIVE METALLIC COATINGS.

At a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, October 3, 1898, Mr. W. Worby Beaumont, president, in the chair, a paper was read by Mr. Sherard Cowper-Coles, Assoc.M.Inst.C.E., M.I.M.E., M.I.E.E., entitled "Protective Metallic Coatings for Iron and Steel."

The author commenced by pointing out the comparative corrodibility of iron and steel under varying conditions, and the importance of the subject now that steel, which corrodes more rapidly than iron, is so largely used for structural purposes and for building light craft, such as torpedo-boats. He then gave some interesting examples of cases where failures had occurred in engineering structures owing to the rapid corrosion of iron and steel. He then stated that up to the present zinc had been found to be the most effective coating, which was due to the electro-chemical action set up between the steel and zinc. The author also explained that the electro-chemical action set up between two different metals made it necessary to carefully insulate copper sheathing from the steel hulls of ships, and rendered the direct application of copper valueless as a protective coating to iron and steel. The author said:—

At the present time galvanising has assumed the proportions of a very large industry, and is rapidly increasing now that steel of small section is being extensively used for constructional purposes. As compared with tinning, however, galvanising is a comparatively new industry, having been worked in Europe only since the early part of the present century, and introduced into the United States from England. Messrs. Morewood & Rogers appear to have been the first to produce commercially galvanised sheets. In December 1846 they took out a patent for immersing articles in a bath of molten zinc, or an alloy of lead, zinc and tin, or zinc-iron alloy, the surface of the molten metal being covered with sal-ammoniac or chloride of manganese. To equalise the coating they employed rollers, revolving in a flux kept at a lower temperature than the melting point of the coating metal.

The chief improvements effected in hot galvanising since its introduction have been in the construction and arrangements of the baths, and in the mechanical appliances for reducing the weight of spelter to the superficial foot. Rolled plates thus produced are not considered to be as good as flux plates, which have an average thickness of zinc of 2 oz. to the superficial square foot. Messrs. Davis & Sons, of Wolverhampton, have introduced a system of wet-rolling the plates after annealing and pickling, the advantages claimed being a more uniform coating of zinc with a smaller consumption of spelter. Another innovation is gas firing, which is being experimented with in place of coke or coal.

The term "galvanised iron," by the way, applied to iron that has been passed through a bath of molten zinc, is somewhat misleading, since it would seem to imply that the coating was effected by a galvanic current. It is intended, however, to apply to the nature of the protective influence, and not to the process. Lead also is sometimes used as a protective coating for iron, but, though lead galvanising is almost as old an industry as zinc galvanising, it has a very limited field, for two reasons. In the first place, it affords no better protection to iron than tin when once the coating is penetrated; and in the second place, its toxic properties render the indiscriminate use of lead-covered articles dangerous.

The comparative inertia of lead to the chemical action of many acids has given rise to the contention that it should form as good a protection to iron as zinc, if not, indeed, a better one. But a piece of lead-coated iron or terne plate, cut from a sheet and placed in water, will rust badly in the course of twenty-four hours, the water and plate being discoloured with red oxide. The use to which lead or terne plate (which contains a small percentage of tin added for the purpose of ensuring a more homogeneous coating) is principally applied, is for manufacturing boxes. Terne plate usually has about ¾ oz. of metal per superficial square foot. Attempts have been made to introduce lead-coated sheets for roofing and general purposes, but in several instances the plates were found to have rusted even before arriving at their destination. At one time a considerable quantity of lead-coated sheets were sent to Sweden to avoid the heavy duty of 66*s.* per ton on zinc-galvanised goods, but no market was found for the sheets, and the enterprise was eventually abandoned. An American process, patented by T. J. Clamer in 1893, and recently brought over to England, was experimented with on a commercial scale for coating iron and steel. According to the inventor, "lead while in a molten state absorbs various gases from its surroundings and the atmosphere, the gases thus absorbed prevent the lead from adhering closely to the surface of metals, and cause the small holes and blisters so frequently found in a sheet of metal coated with lead in the usual way. Messrs. Neumann and Streintz found that lead absorbed about one-eighth of a volume of hydrogen when the dry gas was passed over the heated metal. Mr. Clamer's process consists of fusing the lead to be used as the coating metal under powdered charcoal, and to every 100 lbs. of lead adding, first, 3 oz. of sal-ammoniac, secondly ½ oz. of arsenic, then 1 oz. of phosphorus, and lastly, ½ oz. of boraz or a similar flux.

About the same time as Mr. Clamer's process was put on the market, a process called "Dinizing," for coating articles with a lead alloy, was experimented with; the object being to render the lead electro-positive to the iron. Small quantities of sodium were mixed with the lead, ammonium cloride being used as a flux.

Lead-coated wires have never been adopted by engineers, apparently on account of the electro-chemical difficulties, although manufacturers of steel wire ropes and cables for haulage purposes have on several occasions had their attention drawn to lead as a protective and lubricating coating. Lead galvanising does not reduce the tensile strength of wires like hot galvanising.

The surfaces obtained by hot and by cold galvanising differ considerably in appearance. Hot galvanised articles are often covered with large spangles or crystals, which are obtained by adding small quantities of tin to the galvanising bath; but this attractive appearance is gained at the cost of the durability of the protection afforded to the underlying metal, as the spangles render the coating unequal in thickness and inferior in quality. For these reasons some of our leading engineers now specify that galvanised sheets shall be without spangle, and carry zinc to the weight of one ounce per square foot. Paint does not adhere firmly to zinc surfaces, so to increase the tenacity a varnish containing a small quantity of alkali is applied, which gives a slight roughness or mat to the zinc surface.

The zinc on electro-zinced articles coated by the usual methods has an unhealthy non-metallic look, which has created considerable prejudice against such articles when compared with the brilliancy and glitter of the spangles obtained by the hot process. The dull surface of the electro-deposited zinc can, by the adjustment of the current, be developed into a mat surface, which has been found especially suitable for the coating of nails, as it increases the holding properties, whilst, on the other hand, galvanising decreases the holding power. Galvanising roofing sheets is one of the largest, if not the largest, branch of the galvanising trade. Modern plants are generally fitted with a stretching machine to remove any buckles from the sheets before placing them in the galvanising bath. The average output of a galvanising bath is about 7 tons in twenty-four hours, or four baths working continuously would turn out about 270 tons per week. The cost of annealing 1 ton of sheets about 24 gauge is 2*s.* 6*d.*; and the cost of pickling 7*s.* The percentage of wasters averages about 7½ per cent., due to improper cleaning, flux marks, and cracks which do not develop until after pickling.

To surface-harden galvanised sheets, aluminium is sometimes added to the bath of molten zinc at the moment of dipping the iron sheets, whereby a compound surface of zinco-aluminium is formed on the articles under treatment. It has been claimed that the thin film of aluminium serves as a protecting coat to the molten zinc, reducing the formation of ashes and hard zinc to about half the amount usual where protecting covers of sal-ammoniac, fat or glycerine are used. The addition of the aluminium also enables a thinner coat of zinc to be applied. According to the patentee of this process metallic aluminium only enters into combination with zinc in the proportion corresponding with the atomic weights of the metals.

Some galvanising workers complain that the use of aluminium in the galvanising baths gives them more zinc dross, though they say that with aluminium they can cover a larger surface and do brighter work. The formation of more dross by the use of aluminium is probably due to two causes: first, an impure zinc; and, secondly, to the excessive use of aluminium. Aluminium should be introduced gradually in the form of a 5 or 10 per cent. aluminised zinc, and in a 5-ton bath not more than half a pound of aluminised zinc should be added at a time, so that the total amount in the bath is kept somewhere about

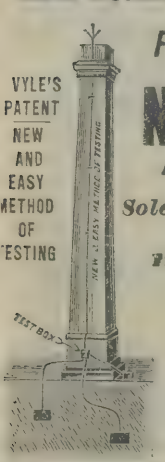
from 3 to 6 oz. of aluminium to the ton of zinc; but a very important point is that this aluminised zinc should be added gradually, and not all at one time.

The zinc iron alloy or dross which forms in the bath amounts in some cases to 25 per cent. of the whole of the zinc used. The quantity usually formed in the galvanising bath amounts to about one-third of the total amount of zinc used for a 24-gauge plate. The zinc iron alloy formed in the galvanising baths is sold to the manufacturers of alloys, or is subjected to distillation to recover the zinc.

The zinc applied by the hot process usually contains lead, tin and iron, and it has been found that iron above 0·13 per cent. makes the zinc too brittle to be properly bent. Lead up to about 1 per cent. is harmless, but above 1½ per cent. will not dissolve, and the excess collects and forms weak spots. Arsenic, antimony, cadmium and copper also occur, but practically never in quantities sufficient to be injurious. Some zinc removed from a Siemens-Martin hot galvanised plate was found to be very brittle, breaking when attempts were made to bend it. Analysis gave the following results :—

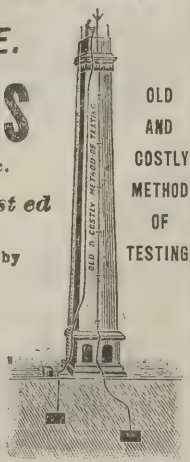
Zinc by difference	49·2
Tin	2·20
Iron	3·78
Arsenic	Trace

The average thickness of the coating was 0·015 inch. On the other hand, zinc applied by the electro process is very pure, and it is found to resist the corroding action of a saturated solution of copper sulphate (Preece's test for Post Office telegraph wires) very much better than hot galvanised iron. A specimen of hot galvanised iron, having 1·42 oz. per square foot, withstood three immersions, whilst a similar piece of iron, electro-galvanised, having 1·26 oz. per square foot, withstood five immersions.



From this it may be inferred that with coatings of zinc of equal thickness, the article coated by the electro process will withstand the ordinary corrosion due to atmospheric influence much better than steel coated by the hot galvanising process; or, expressed in other words, steel coated by the electro process will have as long a life as hot galvanised steel, with less zinc than would be necessary in the case of the ordinary hot process. In applying Preece's test, it should be remembered that copper, when first precipitated on zinc, whether from a weak or strong solution, is black, but in the latter case it becomes chocolate colour as it advances, or red if the action becomes more rapid. The saturated solution of copper sulphate should be made up with cold water, not hot, to ensure that no free acid is present.

The process of electro-zincing is, however, not without its difficulties. The deposits obtained from zinc sulphate solution are adhesive only when great care is exercised in the preparation of the receiving surface. After pickling the iron should be well washed in alkali, otherwise the acid is retained in the pores of the metal and sows the seeds of decay. Other matters of moment are the slowness of electro-zincing when working with a low current density, and the difficulty experienced in coating articles of irregular shape. Difficulty is also experienced from the want of adhesion when the zinc has obtained a thickness beyond that corresponding to 1¼ oz. of zinc per square foot. Attempts have been made to overcome this difficulty by the method employed to make silver adhere to a baser metal, namely, by quickening—that is, immersing the copper or copper alloy to be silvered in an aqueous solution of mercury. As mercury will not amalgamate with iron, an electric current has to be employed. Dr. Leeson, in 1842, patented the use of mercury for preparing metallic surfaces for electro-deposition, both by simple immersion and by the electro-deposition of mercury. The application of this process to the coating of iron with zinc is found to be too costly, the mercury also has a tendency to render the zinc coating brittle.



To reduce the labour that would otherwise be necessary in zincing small articles, such as bolts and nuts, successful attempts were made in 1870 to coat such articles by placing them in a revolving perforated metallic cylinder. A similar arrangement has been employed for coating steel bullet jackets with cadmium and zinc.

Even when ironwork is to be painted, a thin preparatory coating of zinc may be applied with great advantage. Engineers recognise the fact that the best results are obtained when the paint is applied direct to the iron surface, after the removal of all scale and before it has had time to rust, as the rust prevents the intimate contact of the paint and induces chemical action which causes the paint to peel from the iron. Mr. W. John, on examining some small mounds of rust on the outside of a recently launched steel vessel, found that under each heap of rust there was a small hole in the paint not larger than the size of a pin's head, and that beneath each hole was embedded a small particle of black oxide in a pit in the plate. No matter how many coats of paint are put on, they cannot arrest incipient

oxidation, or that on the surface of a plate ; four or five coats of paint fail to protect the metallic surface to any greater extent than two or three coats of anti-corrosive paint possessing a good body and texture. The system of attempting to prevent corrosion by an increased number of coats, and therefore increased thickness of paint, is a deceitful one, for by reason of the thickness of the paint any corrosion on the surface of the metal may not show through the paint by discolouring it in spots or otherwise as it will do if two coats are used. In the latter case it can be remedied, being evident, but an increased thickness of the paint may hide the oxidation that is proceeding, and the mass of coats of paint may yet have sufficient adherence to mask the decay and give a false appearance of durability, until a length rust has formed to such an extent as to become detached from the surface of the metal, the paint ultimately falling off with the layer of rust attached to it.

Experience shows that pigments, usually metallic oxides or carbonates, act as carriers of oxygen from the air from the underlying iron, causing it to rust. An ideal paint should have a toughness which does not depend on a perishable ingredient; its elasticity should not be diminished by cold, it should not soften but rather harden by heat, it should contain no solvents but turpentine, which experience proves to be safe, and it should contain nothing which would act as a carrier of oxygen to the metal.

The durability of painted ironwork, therefore, largely depends upon the surface of the metal being properly cleaned and prepared. An excellent surface in this respect may be obtained at a very small cost by "zinc flashing," that is, coating the iron or steel after pickling with a thin coat of zinc, which will resist the effects of the weather and retain a perfect surface for receiving a coat of paint until such time as it can be applied. The practice of sending ships on their first voyage before painting, so as to allow the scale to detach itself, is not to be recommended.

(*To be continued.*)

SUPERANNUATION OF MUNICIPAL OFFICERS.

The conference convened by the Municipal Officers' Association at a meeting held on September 22 at 117 Holborn, E.C., had under consideration the question of again promoting legislation in the next session of Parliament, and decided to invite all associations and societies representing municipal officers to again send delegates to the conference. The chairman and secretary presented a joint report, together with balance sheet, showing what had been done last session in promoting the Local Authorities Officers' Superannuation Bill. In order to further the movement a conference will be held in London at the end of October to which municipal officers throughout the country will be invited to attend, and a very large gathering is anticipated. Particulars of the place and time of meeting will be announced in due course, and any further information can be obtained by letter from the hon. secretary, Mr. C. J. F. Carnell, 117 Holborn, London, E.C.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

19888. Francis Higgarty, for "An improved flooring or paving composition."

19918. Andrew Turner, for "Improvement in means for operating ventilators."

19988. John Utley Spence, for "Improvements in dog kennels for sanitary purposes, and also for safety and ornamental appliances combined."

20036. Abraham Weil, for "Improvements in cement roofing tile presses."

20166. William Wood, for "Improvement in the construction of lubricating brick dies for making bricks, tiles or blocks."

Specifications Published.

15516. Pease, for "Construction of fireproof flooring and the like structural arrangements."

16173. Imray, for "Manufacture of Portland cement."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE WELL-KNOWN FRIEZE,
ENTITLED
"THE CORN FIELD."
1. Ploughing. | 3. Mowing.
2. Harrowing. | 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—The Lady's Pictorial.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—The Stage.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—The Gentlewoman.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

The Architect.

THE WEEK.

At the desire of the Town Council of Edinburgh, Mr. Waterhouse, R.A., has examined the thirteen sites which were proposed as suitable for the contemplated Usher Hall, viz. High Street, Chambers Street and Lindsay Place, Lauriston Place, Cattle Market, Earl Grey Street, The Meadows, Castle Terrace, Atholl Crescent, Melville Street and Stafford Street, Charlotte Square, George Street and Castle Street, Music Hall site, St. Andrew Square. Mr. Waterhouse was requested to report specially on five among them which were most favoured of late in Edinburgh, viz. (1) Chambers Street, (2) George Street, (3) Atholl Crescent, (4) High Street, (5) Melville Street. Before dealing with the particular sites, Mr. Waterhouse offered some general suggestions. He wrote :—"Edinburgh already possesses innumerable buildings of the highest architectural excellence and beauty, but there is not one of these, I should suppose, so entirely intended for the enjoyment and recreation of the community at large as this gift of Mr. Usher's is designed to be. The site selected should therefore be, in my opinion, not only easy of access and free from noise, but it should be as much as possible an isolated one, with nothing mean or sordid in its neighbourhood to detract from its festive character, and if this were attainable it should be more or less surrounded by lawns and trees, as nothing, in my humble judgment, so much enhances the enjoyment of fine architecture as the softening influence of neighbouring vegetation. Of the thirteen sites visited, only two (neither of which is included in the five before mentioned) appear to me to fulfil these conditions. I will therefore first touch upon these, viz. the Meadows site and the centre of St. Andrew Square."

Mr. Waterhouse considers the western extremity of the Meadows to fulfil the requirements in an ideal way, and as it is positively featureless, it "requires a beautiful building to give it point and character. There is no doubt in my mind that the City Hall erected there would add a crowning attraction to one of the most attractive spots in your beautiful city." According to Mr. Waterhouse, the centre of St. Andrew Square would be also a perfect site. It is free from trees, and is large enough for the buildings. There could be four exits to as many different streets. If properly designed, the Hall would form a splendid termination to the vista going east along George Street. It "would be so far removed from the buildings surrounding the Square (nearly 200 feet) as not, by any possibility, to prove obstructive to the light of those buildings. In no situation would your new building be more appreciated, I venture to think," adds Mr. Waterhouse, "than among the trees and gardens of St. Andrew Square. Nowhere could it be better seen from every side and to better advantage. The drawback to the adoption of this site is the necessity for the removal of the dignified Melville Monument." One of the objections which Mr. Waterhouse raises against the Castle Terrace site is that at present it is covered by modern buildings, and would therefore be expensive, and it is not so absolutely removed from more or less objectionable surroundings. The Chambers Street site is rather restricted. Atholl Crescent, although attractive, would allow of only one front, and that facing north-west. "I think I need hardly point out," says Mr. Waterhouse, "that the north is the worst possible aspect for a beautiful work of architecture. Its beauties are in that aspect only half appreciated." The corner of George Street and Castle Street is considered as not an ideal one for so important a building. The High Street site is described as very expensive, for there would have to be as much building below the level of the street as above it. The quiet dignity of Melville Street would be diminished if the hall were erected thereon. The Cattle Market site would be difficult of approach, and would have many incongruous neighbours. Similar objections apply to Lauriston Place. Earl Grey Street would be noisy. The north side of Charlotte Square is an architectural work of great excellence by the Brothers Adam, and it would be a great mistake to remove it. As the music-hall has architectural merit, especially internally, it should also be preserved. In conclusion, Mr. Waterhouse says:—"My opinion is distinctly in favour of the Meadows site (an absolutely unoccupied one), and next to it the site of the Melville Monument in St. Andrew Square. This opinion would be unaltered, even if the cost to the city for either of these was as great as for any one of the remaining sites. Between these two and the remainder of the thirteen there is a great gulf. But if for any reason the city finds the acquisition of either of these sites absolutely impossible, if it finds itself forced to accept a site of decidedly less fitness at a heavy cost, involving the destruction of more or less valuable property, then I should recommend Castle Terrace in the first place, and the Chambers Street site in the second."

At the meeting of the London County Council on Tuesday the following resolution was agreed to :—"That, as the present system which obtains in London with regard to the supervision of buildings and the responsibility for their proper construction, both from a structural and sanitary point of view, is unsatisfactory, it be an instruction to the Building Act committee to report fully on the subject." What is contemplated is of course an extension of the Building Act. A great many architects consider that too much official interference is now allowed, and their duties will not be lightened by having to obey a larger number of regulations. Unhappily, it will not be difficult to bring forward many cases which appear to prove the necessity for more stringent examination of plans and of structures. The difficulty is, when powers of the kind are sought, to know where to stop. The existing law was originally intended to diminish the risks of fire. By degrees a wider scope was given to the Act. If there are additional powers entrusted to the district surveyors, the expenses of building must be largely increased. As the profit at present rarely reaches a high rate, it is difficult to discover a means to prevent its diminution.

A meeting of the Royal Society of Antiquaries of Ireland was held in Dublin on Tuesday last, when some papers were read. Mr. J. J. Digges la Touche, LL.D., showed a series of photographic slides of old deeds connected with Christ Church, Dublin, which is one of the two cathedrals in the city, and was especially favoured by the Norman invaders. They included some of the oldest Anglo-Norman deeds in Ireland, for they were prepared in the twelfth century. Among the first exhibited was a deed of grant from one of the King Henrys of England of land situated between Portmarnock and Malahide, in co. Dublin, and at present called Kinsealy. This land was granted by the document in question to a Danish king. A portion of the Bull of Pope Urban III. was also shown, in which reference was made to certain churches in Dublin which were to be subsidiary to Christ Church. A deed, the date of which was about 1185, was further exhibited, in which grants of land were made by King John. A number of other documents dealing with old grants of land in and about Dublin formed portion of the series. Reproductions are likely to be published by the Society hereafter.

Visitors to Paris can now see the treasures which the late M. Cernuschi spent a life in gathering. Probably there is no museum in the world which is richer in examples of Chinese and Japanese art. There are three or four thousand examples, and there is not one among them which is devoid of interest; all are admirably arranged, and although the space is confined—for the museum was only the residence of the donor—yet on that account the character of the gift becomes more apparent. There are many figures of animals in bronze, some being enriched with enamels. The pottery is often exquisite and kakémonos, netzkès and other miniature carvings will delight amateurs. Two bronze figures are certain to attract unusual attention; one is a Buddha which expresses more than usual calmness, the other is a statue of an artist which was presented to him by his pupils. There is only one drawback to the exhibition—a catalogue is not yet prepared. But when we consider the value and the interest of M. Cernuschi's bequest it is not likely that visitors will have long to wait for information which is indispensable.

SCULPTURE IN WOOD.

THE announcement of classes for wood-carving, the accounts of the prizes gained by the students, and the publication of drawings for examples and various other signs are suggestive of efforts to revive an art that was almost moribund. That it flourished in England for a long period there can be no doubt. An abundance of suitable wood of various kinds was to be found in the country, and there was a demand not only for carved decoration in relief, but for figures. The English Mediæval churches must have contained many specimens of sculpture in wood. The examples of statuettes, misereres and relief which have survived prove the dexterity attained by the artists. A record is extant of an order of HENRY III. for the supply of three oak trees to the sacristan of Glastonbury, which were to be employed for images, and we may be sure that many owners of woods were no less generous in furnishing materials for a similar use. Probably there were no artists in Mediæval times who could, like GRINLING GIBBONS, imitate a lace cravat, or produce a pot of flowers which was so delicate that the leaves were shaken when carts passed before the house which contained the carving. But as far as can be judged by what remains, the sculptors in wood were at least equal in skill of representation to their rivals who worked in stone. From the resemblance of the styles it is reasonable to conclude that it was usual for sculptors to work in both materials as occasion needed. Some of the Renaissance artists were also willing to carve in wood, although they might prefer stone, in the belief that it was more likely to uphold their reputation. It was a wooden crucifix by DONATELLO which called forth the remark of BRUNELLESCHI, "You have made a peasant labourer, not a god," and led to the exaltation of the sculptor's style, and to the production of a finer crucifix by his critic.

If we go back to an early time it is difficult to determine whether clay, stone or wood was first utilised by sculptors. The earliest memorials were likely to be stones or boulders, which were found lying on the ground. After a time men may have tried to bring the stones into some approximation to a human form. But once the use of clay as a material was discovered it would from its plasticity have more favour in the eyes of archaic artists than stone. The advantages of wood were not likely to be ignored by early inquirers. The material was more easily carved than stone, it did not need time for drying like clay, and it possessed the advantage of portability. Idols were supposed to exercise a protective influence, and for that reason would be carried by tribes in their journeys, and become as necessary as are modern flags in a battle. It was also more easy to make colossal figures of wood than of stone or baked clay, for the parts could be fastened together by simple means. Wood also lent itself to the production of figures which were to be draped with embroidered stuffs. It would be necessary to carve those parts alone which were to be visible, and the remainder could be treated as framing. Wooden figures were also suitable when plates of gold were to be used for the exterior. For the reasons we have given wood deserved preference, especially in an age when men were unskilled as artists. But if the advocates of stone or of clay will insist on the priority in use of their materials, they will at least allow that, as far as age is concerned, wood is entitled to the next place.

The antiquity of wooden figures is suggested by the reverence which they obtained in the days when PAUSANIAS was gathering materials for his Itinerary. He found them surviving in many of the sacred places, and according to him they were generally known as *dædala*, for they were popularly associated with the mythic sculptor who was believed to be the originator of the art in Greece, and whose work, according to HOMER, was imitated by VULCAN when preparing the "Shield of ACHILLES." PAUSANIAS said he had seen a colossal statue of MINERVA POLIAS which was made of wood by EUDŒUS, the pupil of DÆDALUS. The goddess was seated on a throne, and held a distaff with both her hands. According to the same authority, there was a colossal figure of APOLLO made of cedar in Thebes, which was supposed to be carved by CANACHUS, an artist who was described by CICERO as holding a position in sculpture corresponding with the elder CATO'S in oratory. In Olympia were also statues of cedar by THEOCLES, one representing ATLAS bearing the heavens. Several other examples are mentioned by PAUSANIAS. When we read about them we appear to have gone back to the region of fable, where everything is a delusion. The Greeks could not mistake the character of the figures. They knew as well as CICERO that the figures of CANACHUS were wooden in another sense, "rigidiora signa Canachi," but they held them in reverence. Greek archæology was more than a science, and it is well for us events were recorded which the peoples of a later time would consider as childish.

As long as the Greeks were proud of the past and their predecessors, they were likely to do all they could to preserve ancient styles from becoming entirely obsolete. Sculpture in wood would therefore be, at least, occasionally produced. PHIDIAS was the sculptor of the colossal MINERVA of Platea, of which the head and feet were formed of marble, while the body was of wood and gilded. The combination of materials will nowadays appear unworthy, but the Greeks could reconcile things which were contrary in their nature and, moreover, the statue may have been intended to display the characteristics of an earlier work. The Platean MINERVA was, no doubt, one of the early works of PHIDIAS, but if we possessed accurate information about him, we might learn that he never altogether abandoned his practice in wood. The great *Zeus*, which was his final work, could hardly be produced unless the sculptor employed a kernel of wood on which to place his gold and ivory.

The woods which were available for the sculptor's use in Greece were sufficiently various. We cannot of course be certain that in every case the wood corresponded exactly with the description to which we give a similar name. Cypress is now being used in America for fences and palings. It must be altogether different from the Greek wood, and the cypress grown in England is supposed to be no more than an ornamental tree. Yet PLINY speaks of a statue of JUPITER made of the wood which was set up in the Capitol of Rome in the year 97 B.C., an event which reveals that at so late a period there was no prejudice against carved wood. The gates of the Ephesian temple were said to be of cypress, and to have endured for at least four centuries. If we credit PLINY, the gates of the Temple of Apollo at Utica, which were of cedar, were still more ancient, for they survived fifteen centuries. Cedar was evidently a favourite wood with sculptors, and the poets in all ages have had a weakness for it. From its durability it was considered to be well adapted for statues of gods. Some authorities say that the Greek cedar was a kind of cypress, while with apparently more reason it is classed with the thuja, or arbor vitæ.

Ebony was used for statues, and among the sculptors who preferred it were SCILLIS and DIPŒNE of Egina. Why such dark wood should be considered suitable is one of the unsolved puzzles of art. Time would consecrate its employment, but the difficulty is to realise what quality first made it admired. There is mention of a colossal statue of HERCULES for which beech was employed. The wood of the fig tree, from its ease in working and colour, is also mentioned, as well as oak, box, sycamore, olive, pear, &c.

The use of wood was not peculiar to Greek artists. HERODOTUS saw very large statues of the material in Egypt, and some of the most remarkable portrait statues which were derived from modern excavations are of wood. The hardest materials—basalt, porphyry, granite—were, however, more in keeping with Egyptian ideas about futurity, and were generally employed.

Of late years the doors of the Academy have been opened to several kinds of sculpture. But we cannot recall a single example in wood among them. The Academicians would say the material is only suited for the production of Swiss figures, which are adapted for toys or for appendages to clocks, and, therefore, would be out of place in Burlington House. But if an Academician would have the courage to produce a figure in wood occasionally, it would do much to elevate the character and to increase the value of the wood-carver's work. The art is one which is in our time too much associated with one class of decoration, and is in danger of being superseded by machine work and copies in composition. It has, however, an antiquity that is almost as remote as that of sculpture in stone, and for many modern purposes it has advantages over work in marble or metal.

THE ARCHITECTURAL ASSOCIATION.

THE opening meeting for the session 1898-99 was held on Friday evening last in the rooms of the Royal Institute of British Architects. The president, Mr. G. H. Fellowes Prynne, after distributing the medals, certificates and prizes to the successful students, delivered his inaugural address.

Medals and Prizes.

The principal prize-winners of the past session were :—

A.A. Travelling Studentship, value 25l., and Bronze Medal.—H. F. Waring.

A.A. Medal (Silver Medal and 5l. 5s.).—F. Dare Clapham. *Second Prize, value 5l. 5s.*—T. Tyrwhitt.

Essay Prize, value 10l. 10s., and Silver Medal.—F. N. Reckitt.

Measured Drawings Prize, value 5l. 5s.—A. M. Torrance. *Hon. Mention.*—J. G. N. Clift.

Andrew Oliver Prize, value 5l. 5s.—A. J. Roddis.

Arthur Cates Scholarship, value 10l. 10s.—T. Bee.

LECTURES.—*Division I.*—Silver medal and A.A. Scholarship, value 6l. 6s., S. H. Goodwin; bronze medal, H. S. Barrett; hon. mention, S. Wheeler. *Division II.*—Silver medal, T. G. Lucas; bronze medal, W. M. Settle; hon. mention, H. T. Bromley. STUDIO.—*Division I.*—Silver medal and certificate, not awarded; bronze medal and certificate, C. H. F. Comyn. *Division II.*—Silver medal and certificate, C. E. New; bronze medal and certificate, J. G. N. Clift. PERSPECTIVE PRIZE.—L. G. Detmar.

President's Address.

Mr. Fellowes Prynne began by describing the educational work of the Association, and the facilities offered for supplementings the present system of pupilage to those members who are unable to take advantage of the regular four years' courses. He then said :—

Undoubtedly the greatest need of the Association at present is the want of new premises. For years past this need has been unceasingly felt. The prospect of new and more suitable premises has so often been foreshadowed, unhappily without any tangible result, that I cannot wonder that members should feel disappointed, and consequently somewhat apathetic on the subject. But I can assure those who are not immediately behind the scenes that the question is by no means an easy one, and beset with many difficulties. The committee, as a body, certainly have not shirked the question. Time after time have different schemes been brought before them, and many hours have been spent in the inspection of possible buildings, and yet on only two occasions have we come anywhere near the solution of our problem, and then to find our hopes blighted by some unforeseen difficulties. The largeness of our requirements and the limited means at our disposal form the two great obstacles to the attainment of our long-deferred hope.

In company with several of my predecessors in the chair I had good reasons to hope that I should be able to bring before you this evening a scheme that would meet our requirements, and it is with much regret that I find myself at the last moment unable to do so. But I can say this much, that the Jubilee premises committee have under consideration another scheme that we sincerely trust we shall be able to submit for your consideration at no distant date. As certain questions have lately been put to me on the subject, I will briefly state what I consider our needs are, and what I shall aim at obtaining in any scheme for new premises.

In the first place, I should like to see our Architectural Association centre made much more of a true centre, a home or club, if you like it better, of architectural life ; a place where one and all members could drop in at all reasonable hours of the day and enjoy the privileges of a good common room, where light refreshments could be obtained, and a comfortable reading and writing and smoking-room ; a place where one would not feel ashamed to ask a friend or client to meet one, and where the parents and guardians of any student might call without feeling that they were visiting a sort of architectural wholesale warehouse or counting-house ; and last, but not least, a place where country members or members of allied societies could call and feel that they had a homely centre in this great Metropolis where they would be always welcome and could meet men of like interests to their own.

I have no wish to draw any fantastic picture, but in my humble opinion a modified club life such as I have referred to would be of great service to the younger as well as the older members of the profession. Within proper limits its tendency would undoubtedly be for good all round ; it would form a social background to the otherwise serious educational work of the Association, which would reflect warmth of feeling and create a spirit of *esprit de corps* amongst its members. I could wish that there was some such club life in the Royal Institute of British Architects that it might be in reality what it should be, the proper social as well as the professional centre in London for all architects.

In addition to good offices and library and classroom accommodation it is, I think, desirable that we should have our own meeting-room if possible and a large well-lighted and ventilated studio will be an essential feature ; and the next important new requirement should be demonstration workshops, an addition which will, I hope, be one of the great features of our future educational work. You will notice that I use the title demonstration workshops. I do so advisedly. Any scheme for extensive workshops in various trades would (even if it were desirable) be entirely beyond our means.

Men who wish to attend regular workshops where they can see a large variety of work can always make arrangements with some good builder to do so, and they will no doubt obtain a good insight into practical work. There are, however, many obvious difficulties, and I think some objections to regular builders' workshops training. To begin with, anyone who wishes this sort of training to be of real service to him must make up his mind that no half measures will be successful. He must drop any kind of kid-glove studentship and be ready to work with his hands, and on the same footing as an ordinary mechanic. There are troublesome class difficulties and craft jealousies to be faced—a footing to be paid for, added to which there are only too often influences of a low moral and degrading kind, that cannot be healthful to the younger student just starting upon his life's career, and in saying this I speak from personal experience. Again, hard manual work at the bench or banker may often be injurious to a man's sketching and pencil work.

It is for these reasons that I think the first practical training for architectural students should be in technical schools and demonstration workshops rather than at the actual bench or banker at a builder's works. If after such training a student can take the position of a clerk of works, or a place under a good clerk of works, I believe he will have precisely the kind of practical training that an architect requires.

The demonstration workshops that I should like to see in connection with the Architectural Association ought to consist of at least three large rooms ; one for carpentry, a second for mason and bricklayer's and tiler's work, and a third for plumbing and general metal-work. The furniture would, of course, consist of benches, bankers, lathes and other necessary tools and appliances on a modified scale ; but, further, it should be furnished with models of wood, stone and metal construction, and plumber's work. In some cases, such as roofs, floors, staircases and groining, the models would necessarily be on a small scale, but in all cases they should show accurately the construction, with joints, tenons, mortises, scarfings, &c., complete.

But for such details as doors, window-sashes and casements, and other things of everyday use that will readily suggest themselves, full-size models would be more useful, and so made that they could be taken to pieces and put together again, so as to be copied, bit by bit, to small scale by students.

It may be objected that the cost of such models would be very considerable, which, if they had all to be especially made, would certainly be the case. But I would suggest the following method for the commencement of work in this new department.

1. That the initial expense to the Association would be the necessary fittings, tools and materials. When these were once obtained the fees for the workshop course should be more than sufficient to pay the remaining expenses.

2. That the services of experts in each of the various trades should be obtained at a reasonable fee, and that the duties of such experts should consist of descriptive and practical lessons in setting out work on the board from scale drawings, and as to the best application of that setting out to the actual materials, so as to obtain the best results and avoid unnecessary waste, to give actual working demonstration on the bench or otherwise in preparing and afterwards putting together the model to be constructed.

3. To superintend the students' work in carrying out various portions of the same model or other work he may set them to do.

4. That certain members should be invited to become visitors, and that they should from time to time set a subject for a model, or a problem, and give designs and details, say, ⅛-inch and ½-inch scale, to be worked out in proper materials by students to 1½-inch or 2-inch scale, or larger as the subject might allow. By this means it will be at once seen that in a few years the Architectural Association would have a most valuable set of models always ready for reference, made by the students themselves under the supervision of an expert, and without any other than the ordinary running expenses being entailed. When our collection of models was large enough, no doubt the students who made future models would be glad to keep their own handiwork in memory of the happy hours spent in the demonstration workshops of the Architectural Association.

I may here remark that the manual labour involved in working out these models and details to scale is a very different

matter to working on large planks and heavy stones in a builder's yard, yet for all practical purposes the teaching would be the same, and that without injury to the hands for drawing purposes.

Please forgive me if I seem to have dwelt on this subject at some length, but I feel so strongly that this addition to our curriculum would be such a popular and useful feature in our future work that I could not refrain from expressing my views plainly.

There is one other class that I should like to see revived in connection with the studio, and that is drawing from the antique and from the life. I say revived, because as far back as 1864 a class was started for this end, but from lack of the method such as we now have it fell through. I cannot but think that such a class would be found very useful to many of our members of all ages.

I sincerely trust that my picture of what we hope for in our new premises is not merely a fancy one or fated never to take substantial form, but that ere long we shall see it an accomplished fact, and that our long and patient waiting will only make us value the more our new home, wherever it may be.

Gentlemen, at the commencement of this paper I addressed you as fellow-students in architecture. Believe me, I meant this to be no mere form of words. I take it as a simple axiom that we are one and all students in our beloved art, and this is an axiom that cannot be too often repeated, for I fear that after passing through the first stages of studentship and commencing practice, many are far too apt to agree with the sentiment of such an axiom without carrying forward their studies, and thus building up upon the foundation of their earlier architectural education. It may be safely asserted that no profession or art needs more keeping up and continuous study than architecture, and it is equally certain that an architect who ceases to study, not only by book-work, but by travelling and sketching, becomes sooner or later a mere repeating machine. His ideas crystallise, and his designs become cold and lifeless.

It is for this reason that I hope one and all of our members will claim the honourable name of student in architecture. We are only on different stages of the ladder. To those who are just commencing their climb let me say—look well before you start. Consider well what are your qualifications. Can you honestly say that you love art for art's sake, that you are prepared to work hard and in a great measure to sacrifice your pleasure for your art, that you do not take up architecture merely because it is a respectable profession? If so, then I think you may go forward with every confidence of future success. But if not, for the sake of your future happiness and welfare, you had far better turn back before it is too late. If you seek an easy-going and lucrative profession only, do not become an architect. The practice of architecture is neither easy nor lucrative; on the contrary, it is one of the hardest working and most poorly paid of professions, as a large number of its members have, I am afraid, learnt from sad experience.

On the other hand, the man who sincerely enters into the true art side of architecture will experience great pleasure in his work, a pleasure that it would be hard to surpass, if indeed to equal, in any other profession or calling, and although wealth will be within the grasp of comparatively few architects, yet with a true love for his art as his main guide, with industry, ordinary business capacity, and last, but not least, absolute integrity in all business transactions, he will almost invariably be sufficiently successful to render his professional career a happy one.

In speaking of architecture as a poorly paid profession, I am reminded of a somewhat amusing episode. A client of mine wrote a certain sanitary surveyor and auctioneer, &c., who she had previously employed on some sanitary work, complaining that his charges, which I may say amounted to over 15 per cent. on a total expenditure of some 1,600*l.*, were greatly in excess of the charges of architects whom she had employed before on other house work. The answer of the sanitary surveyor and auctioneer, &c., was to the effect that of course his charges were quite a different matter to those of an ordinary architect. He was a specialist. This, at least, indicates that there are some people who think that architects must be poor sort of things to charge so little, and in passing I cannot help remarking that our system of charges does seem somewhat an anomaly—the Scott, Street or Pearson of his age charging precisely on the same scale as Mr. Tom Brag, architect, auctioneer and house agent. It is somewhat like a Millais or Leighton charging at the same rate per square foot of canvas as Mr. Daub, who once succeeded in getting one of his pictures marked with a big D, and hung in the Academy.

The result is too often that the men who have made a name get more than they can possibly attend to properly, whilst the less-known men get little or nothing to do.

I feel that, from an art point of view, it is an utterly wrong system, but as the public, our patrons, would not be satisfied unless there was an equal schedule of charges, I acknowledge the difficulty of finding a remedy.

Having in the early part of my address referred to some of our smaller weaknesses in working, I think I may now fairly congratulate the Architectural Association on its otherwise prosperous condition.

Our roll of membership is the highest on record, and you will be glad to hear that our members have reached a total of more than 1,220. This in itself is sufficient to show how widespread is the interest that is taken in our work, and how popular our Association has become in every branch of the profession.

Added to this, I am glad to say that in spite of necessary extra expenditure our financial position is still sound, and again, that our position from an educational point of view is equally sound, in that our many able instructors are content to remain with us and to thus place us in a position of being able to offer students advantages in architectural education far superior to that offered by any other institution of the kind.

But these are not the only signs of encouragement or success. The rejoining of several old members who had allowed their membership to lapse and the joining of some new members whose names are well known in the profession has been quite a feature in the commencement of this session. Amongst the former I must mention our old friend Mr. Arthur Cates, who has been reinstated as a member on his own request, and has paid up his subscription for no less than thirty-four years, placing him now in the honoured position of the oldest living member of the Architectural Association, and amongst the latter are Mr. H. T. Hare and Mr. Edwin T. Hall.

We extend to these gentlemen and to all who have joined our ranks in like manner the hand of good-fellowship and warm welcome, and we hope that they will not be content with adding their names to our list of members, but will help us from time to time as occasion may require with their counsel and advice, or in such of the voluntary work that still happily remains a part of our system. It is here that I would venture to make an especial appeal to the profession at large to join our ranks, as by so doing they will not only help us morally by their sympathy, but by their annual subscriptions will help the educational work of the Architectural Association financially.

We year by year gratefully acknowledge the valuable help and support given us by the Institute, without which we should find it difficult to keep up the standard of our work. Whilst I cannot but consider that the Institute, as the leading architectural society in the land, only do what is their bounden duty in helping forward the educational work of the Association, yet the help they give us is the more valued because it is given freely, and without being trammelled with conditions, showing that the Council have faith in both our system and our officers.

The generous financial help given by several leading architects, when the Association most needed it, at the commencement of our present scheme of education, will always be remembered with gratitude. We cannot, however, expect this kind of help except on very especial occasions, or for very exceptional purposes.

Surely it is not too much to expect from other architects, who have been fortunate and successful in the practice of their art, and who have not previously helped our cause, that they should come forward and help to the best of their ability the great work of education being carried out by the Architectural Association.

Is this work to be left to a few hard-working architects, whose enthusiasm and love for the future welfare of their art urges them to give their time and talents ungrudgingly for the cause? Can we allow it to be said that we, as a profession, are so selfish, so warped in our ideas, so wrapped up in our own small centres of art and petty personal interests, that we forget, or will not take the trouble to remember that there is a great cause to be worked for as well as that which more closely concerns ourselves? Surely not. If the helping of our younger brethren in their early architectural training tends to the good of that great cause and the advancement of our art, as I maintain it does, then surely it is the duty of all to do what they can for that end.

Some twenty-five years ago, when I was in the Western States of America, on the shores of Lake Superior, an American friend met an old priest, who was a most eloquent preacher, and asked him why it was he was content to stay there in the then wild West, on a poor income of 500 dols. a year, when, with his powers, he could get 5,000 dols. in New York. His answer I have always remembered. He said:—"What you say may be true. What is 5,000 dols. to me, compared with my duty to the great cause I was sent to take charge of in this district? I am doing my little best to fulfil my duties: when my work is done, my little best will go to strengthen the great whole, and so the work of the great church advances."

I only give this as an illustration of a noble example of self-abnegation for the benefit of the whole body, and as it is applicable to any act of unselfishness for the good of others.

Although the great cause referred to in this simple anecdote is, of course, incomparably greater than ours, yet the same principle applies.

In common with that of the artist, our art of architecture, which is itself noble and refining, calls into existence one touch of the divine faculty—creative genius. We have in that art a great cause to work for, and the more we can make our individual work tell for the good of the cause as a great whole, and the more we can help others forward in working for that end, the better it will be for ourselves and for the advancement of our art.

Amongst the other encouragements in our work it is satisfactory to notice the growing interest and increased attendance at our fortnightly meetings, and the success of the discussion section.

It is often a cause of wonder to me how it is that the papers at these meetings keep up such a high standard as they do. As a set of educational papers they are most valuable, and, judging from the titles and well-known names of the readers of papers for the present session, we may hope for excellent results. I do hope that members will prove their appreciation by a large attendance, and further that the younger members will try and join in the discussion after the papers.

An excellent syllabus of papers has also been arranged by the energetic members of the discussion section. The papers of this section are often exceedingly good, as may be judged from some of those we have published in the "Architectural Association Notes." I should strongly advise students to join, as the meetings are so arranged as not to clash with other class work, and it is here that they will be able to gain confidence in asking questions and speaking in public.

There is another side of the Architectural Association work which is most useful, and is now as successful as it has ever been. I refer to the social side. Now there are some to whom this side of our system is somewhat a stumbling-block. They think, and I have heard some say, that it seems a pity we should spend money on such frivolities as our annual soirée and members' smoking soirée. I must entirely disagree with those who would cavil with us on this point. Their objections arise either from an entire misconception of the objects of our social gatherings, or else from want of experience in the work of such a Society as the Architectural Association. I can, of course, conceive that it would be easy to let the social become a too prominent feature in our system, which would be distinctly injurious to its main objects. But under our present elective system, in which a very large body of men of tried experience have a voice, I believe there is no danger of such an evil happening.

The social side of the Architectural Association is, and I trust always will be, one of its great features, contrasting as it does favourably with that cold red tape system that would dub every kind of relaxation as undignified, and every penny that was spent on it as wasted.

To speak more strongly, I would say that the social side of our work is one of our sheet anchors. Take away that social side and you will have a model in still life, perfect perhaps in its form, but lifeless and without soul.

Indeed, so strongly do I feel the great use of the social side of our work, that my great wish, as I have before stated, is to see a modified form of club life established in connection with our new premises.

It is this social side that is one of the main wants of the Institute. It would give it a kind of life and soul that it does not now possess; it would make it more attractive to young and old. This to my mind is an exact case in point—few can find fault with the thorough and business-like way in which the great and excellent work of the Institute is carried out, but no one will suggest that its social qualities as a body, almost exclusively confined as they are to a guinea and half annual dinner, are such as to inspire fraternal feelings in the bosom of the most warm-hearted artist.

But in the Architectural Association one of our greatest aims is to encourage that social intercourse which is so valuable, and that strong feeling of fraternity that should exist amongst all true artists. In a limited way our annual excursion helps to create, extend and foster that warm feeling of brotherly equality in art.

One episode in the last excursion was the admiration called forth by Nesfield's work at Hampton-in-Arden, Warwickshire—and especially his careful restoration of the village church. Here I felt, and I think we all felt a touch of brotherly kinship for the artist, of whom it may truly be said "though dead, he still speaketh."

May the works that we carry out speak in the same language to future generations, and here I cannot help referring to the loss we in common with the whole art world have sustained by the death of Sir Edward Burne-Jones. If there was any one artist more than another who entered soul and spirit into the greatness of his art, whose highest aims were purity and poetic ideals, whose work has influenced the whole world of art, and the result of whose influence and example will live on for generations to come, that artist was Burne-Jones. Such a life and such art as his must mark him out as the artist among artists of the nineteenth century.

In speaking of painters generally, one could wish that they, as a body, could enter more into the art side of architecture than they do. Of course there are many exceptions, but as a body I do not think it can be said that they really appreciate architecture, and certainly very few take any trouble to learn the guiding principles of our art.

The more they do so the more will architects be able to enter into their feelings, with results that cannot help being mutually beneficial in case of decorative work.

Undoubtedly we, as architects, have many bad traditions to unlearn, and much more that is good to learn.

We are much too apt to accept the shoddy decorator's bad copies of ill-drawn Mediæval work, and seek to obtain quantity instead of quality. It is only the drawing together of architects, artists and sculptors in mutual intercourse, and the exchange of ideas, that will help to break down the ignorance that exists on both sides and bring about the harmonious results to be desired.

This mutual understanding is equally, if not even more necessary, between the architect and the stained-glass artist. On the one side, how many buildings have been ruined by the stained-glass put into the windows, owing to the entire want of sympathy on the part of the artist with architectural surroundings, and on the other hand, it not unfrequently happens that the artist is trammelled by the requirements of an architect who knows little or nothing of the correct treatment of glass, and seeks rather to obtain a series of copies of pictures in glass than a glass picture.

The employers are, of course, often to blame for these incongruous results. Their estimate of the duties and capabilities of architects is often, and not without cause, a very limited one. That the architect's artistic powers should extend beyond the limits of bricks and mortar, drains and ventilation does not occur to many—on the other hand, their views of an artist's power, simply from the fact that he is called an artist, are sometimes extensive, and they would deliver the work of decoration of a building or the stained windows into their hands without for a moment thinking whether such artist has any sympathy with architecture, and without realising that the whole architectural proportions and effect may be simply ruined by the misapplication of colour decoration and ill-chosen glass. An amusing instance of how extensive the powers of an artist are considered to be occurred to my brother who, when considering the scheme for the mural decoration in one of my churches, was asked mysteriously by the churchwarden if he could consult him on a small matter of business. "The truth is," he said, "I have a friend who has a false nose, and he wants it painted. Will you kindly undertake the job?"

But whatever our powers, be they limited or extensive, do let us as a body try our best to get in touch with artists and craftsmen of all kinds, and then I feel sure that those whose work is worth having will gladly meet us half-way, to our mutual benefit.

In drawing to the close of an address of this kind one feels how much there is that might be said with advantage on many points that there is no time even to touch upon, and how many things one ought to have said that have been omitted. But please forgive such omissions, and although what I have said may at times have seemed, as before hinted, somewhat severely practical, I trust you will believe that the sentiments therein expressed are sincere.

Gentlemen, let my last words be to remind you that as architects our responsibilities are as great as our work is noble, and the growing appreciation of what is beautiful and what is highest and truest in our art, within our ranks, if we are true to ourselves, cannot but make its influence felt in the outside world.

Great as has been the advance in our art during the last sixty years, yet architecture as an art is at the end of the nineteenth century only beginning to be recognised as such by people at large. Officially, the best representatives of our art, the men who are entrusted with the building up of the nation's monuments of peace and prosperity, remain unrecognised and unrewarded.

A great, free and enlightened daily Press as yet treats architecture with comparative indifference, and from simple want of appreciation of the work involved in the design for any great building, in many cases consigns the name of an architect to oblivion. For some of this indifference and want of public acknowledgment we, as a profession, have in a measure ourselves to blame. When people have forced upon them such buildings as have lately been allowed to disfigure such sites as the Embankment, Somerset House and Victoria Street, Westminster; and when buildings that have been erected at great cost have from time to time to be condemned as unsafe through structural defects, it is no wonder that they cry out, Where is the art and science in architecture?

It is the object of improving matters that forms the very *raison d'être* of our Association. But we must also remember that however much we may value the appreciation of others, our art as such is in no way dependent upon public apprecia-

tion, which as all know is a fickle quantity. The highest art is the true reflex of the inner man. Let your work be truly your own work in every sense of the word, stamped indelibly with your own individuality.

It is by such work you will make your "little best" strengthen the great whole and advance our art. We architects are the writers of a nation's history in stone, brick, mortar and metal. It is our work that will speak of the nobility and greatness, or weakness and depravity, the richness or poverty of a nation.

Think of the history that is recorded to us by the great architectural works of Egypt, India, Athens, or Rome—think again, how accurately the work of the early and Mediæval times describes the character of men then living. Surely an art such as this is worth living and working for.

To us in a great measure is entrusted the comfort and health of the community, to us the raising of great municipal and national monuments, and last, but not least, to us is given the honour of designing temples for the worship of the Great Architect of the Universe, buildings that will each, in their own way, in the future, influence men's minds for good or for ill, as the buildings of our forefathers have influenced our own.

For students let my last words be those of Bacon:—"Our studies serve for delight, for ornament and for ability."

A vote of thanks, proposed by Mr. H. H. Statham, seconded by Mr. Beresford Pite and supported by Messrs. E. T. Hall, Cole A. Adams, W. Millard and W. H. Seth-Smith, was passed by acclamation to the President.

THE ASSOCIATION SCHOOL OF DESIGN.

IT has been desired by many architects that the close of the nineteenth century might leave the outlines of some new style which would mark the progression of the age and hand down to posterity the record of Britain's greatness in the years of Queen Victoria's sovereignty. The new buildings of to-day possess such freedom and broad-mindedness in treatment as could only be derived by the facilities for travel which are offered to the artist of our time. If therefore our national progress is to be marked by the adherence to certain principles of style in art, great care must be taken with the young architectural student to instil his mind with a genuine love for the beautiful, and if the teaching has been good, when experience has added its polish, the efforts of his masters will be apparent in those of the finished student.

Perhaps it is for this end that the Architectural Association has decided to bring before students the claims of a class of design and handicraft.

A preliminary meeting was held on Tuesday evening last at Great Marlborough Street, when addresses were given by Messrs. G. H. Fellowes-Prynne (president), Aston Webb and Cole A. Adams.

The President said that the object of the school was to assist students in the study of design. The class already existing did not receive the attention it deserved. During the last two sessions there had been a falling off both in membership and quality of work, and this had given great disappointment to the committee and those more immediately interested in this particular and most important branch of the Association's educational work. In the A.A. school of design the subjects are limited to four during the present session, and the fees for either the elementary or advanced class, including the practical workshop demonstrations, have been reduced to five shillings per session. It was hoped that these changes might be so appreciated by the students that the school of design would become the most popular and important in the Association. Many architects in the past had not the same advantages that the student of to-day had, and this particular class of study proved to many how deficient the old training had been. The Association encouraged no particular school of thought; in fact, throughout its entire training it wished to be as catholic as it was possible to be. The student was encouraged to develop in his work all that would mark it as his individual style, although freedom and originality in design must be followed with moderation. It was essential to understand the value of past experience, and unless we built upon these foundations, our results would only bring chaos. Sketching, deprecated by some, gave more help in design than any work—more even than notes and books. The first aim of the student was to make himself a good draughtsman, and then when he can make a good drawing the perfection of planning should be the one important end. However fine the exterior of a building may be it can never make up for bad internal planning. The style in which a work is to be carried out should be that in which the student feels he takes most interest. In these earlier attempts at design ornament should be left alone. Nothing shows more quickly the capabilities of the architect, but when bad nothing more quickly mars his purpose. If the building is wrong it can never be redeemed simply by its ornament. All ornament must express an idea given through the functions and objects of the structural part. The ornament is in a sense the interpreter of construction. Ornamentation must, however, arise naturally of itself and not appear forced. It must also be remembered that the decoration of the various parts must have rhythmical relation the one to the other and bind together the whole harmoniously. It was for the students' interest the committee were now working, as in so doing they felt they were helping forward in no uncertain way the noble art of architecture.

Mr. Aston Webb then made some remarks on planning in design. He explained his ideas on the blackboard, although it was not difficult to follow the simple language with which he instructed the students who were present. One of the first things of importance in planning is the placing of the building, a point which is often neglected, and one which requires long consideration in large towns where the space is so often limited. It was necessary to have an idea or principle of what one was going to do, and it was no use starting on a building until there was this scheme or idea regarding its elevation in our heads. This idea or principle would often, perhaps, get the same reception as the flower sung by Tennyson. Some in the world would consider it a weed, but in course of time others would see its merits and copy or steal the idea. When sitting down to make a plan it is advisable to do it to a small scale and enlarge it afterwards, when there is something to work upon. On the small scale, the walls could be represented by lines. When considering the site of a building it would be found to reap immense advantages by being placed at a right angle to the line of approach, and the grand effect of some buildings abroad was in a measure due to the observance of this rule. In London many of the streets lost their effect simply through its non-observance. Here many of our streets ran into acute angles, proving most painful and troublesome to the architect. Regarding the system of planning in public and private buildings, both must be different. In public buildings all the means of communication should be as simple as possible, whereas in a private house the reverse is necessary. Easy communication was not wanted with all the rooms. Broad, straight corridors, properly lighted, are essential in public buildings, and the question of lighting was an important one. A corridor, with a window at the further end, was better than to get the light through glass over the tops of rooms leading off from the corridor. Another point was that the lighting of a corridor should not be all the way alike; there should be light only at intervals, but still an ill-lighted corridor was as unsatisfactory as an ill-lighted room. As the first impression is a great thing in a public building, good effect must be a great aim. Halls are much finer and more imposing when entered at the end rather than the side. Mystery in planning is to be aimed at in public as well as private buildings. In dealing with staircases it is essential that they should be as prominent as possible in public buildings, whereas the private owner will often prefer the view of the staircase to be hidden, at least, from the front door. In private houses skill had to be exercised in the placing of doors and fireplaces. In a sitting-room the fire would be placed away from the draught of the door, whereas in a bedroom this was not so necessary. Mr. Webb said he had received so much good from the class of design in his younger days that he very gladly accepted the invitation of their President to make a few suggestions. He advised students to "work for the joy of the working, and not entirely for money and fame."

Mr. Cole A. Adams also read a short paper on "Colour."

A vote of thanks was passed by acclamation to the three speakers.

TESSERÆ.

Contorniate Medals.

THE term "contorniate" is sometimes employed to designate a species of medals or medallions of bronze let into a circle of another material. The contorniate medals have seldom such high relief as the common medals, being scarcely more raised than our modern current money. On many ancient medals of this sort are found a monogram composed of the letters P and E, or an R reversed, with a palm engraved in intaglio. On one side is generally a head, and on the other some historical mythological subject taken from their plays. What distinguishes the contorniate medal from others is the want of connection between the subjects of the reverse and the head upon the obverse. As mythological and heroic subjects, such as Cybele and Atys seated in a car drawn by lions, a bacchanal, the combat between Hercules and Nessus the centaur, that between Achilles and Penthesilea, queen of the Amazons, Diana and Endymion, the education of Achilles by Chiron the centaur, the rape of the Sabines and the Circus Maximus at Rome, as reverses to the head of Alexander the Great—gymnastic exercises, races in the circus, on the reverses of Homer, Horace, Socrates, Virgil, Apollonius Tyaneus

Terence, Sallust, Apuleius, &c. On a contorniate medal, described by Millin, is even found the heads of Nero and the younger Faustina. The same types are often to be found upon reverses of different heads, as the fable of Scylla is represented upon medals having the heads of Alexander the Great, Nero and Trajan.

Advantages of Criticism.

There are few spectators of a painter's work, learned or unlearned, who, if they can be induced to speak their real sensations, would not be profitable to the artist. The only opinions of which no use can be made are those of half-learned connoisseurs, who have quitted nature and have not acquired art. That same sagacity which makes a man excel in his profession must assist him in the proper use to be made of the judgment of the learned and the opinions of the vulgar. Of many things the vulgar are as competent judges as the most learned connoisseur; of the portrait, for instance, of an animal; or, perhaps, of the truth of the representations of some vulgar passions. It must be expected that the untaught vulgar will carry with them the same want of right taste in the judgment they make of the effect or character in a picture as they do in life, and prefer a strutting figure and gaudy colours to the grandeur of simplicity; but if this same vulgar person, or even an infant, should mistake for dirt what was intended to be a shade, it might be apprehended that the shadow was not the true colour of nature, with almost as much certainty as if the observation had been made by the most able connoisseur.

Inundations in Rome.

During many centuries Rome was liable to destructive inundations. Several are recorded by Livy, Eutropius, Dion and Horace, and they amount in all to sixty-two, from the first mentioned by Livy as having occurred A.U.C. 590, to the last in the time of Pius VII., in 1805. That recorded by Dion A.U.C. 731, destroyed the Sublician bridge; that of 744, mentioned by Horace, ruined the Temple of Vesta. That in 788 of our era swept away both the Flaminian and Sublician bridges; that of 856 reached the church of St. Mark; that of 860, in the time of Hunorius III., ruined the Palatine bridge, now the Ponte Rotto; that of 1280 rose 4 feet above the floor of the Pantheon. Those of 1378, 1412, 1476 and 1513 are marked by slabs inserted in the front wall of the Minerva Church, where the fourth and greatest, under Leo X., rose 12 palms above the level of the street in that point. In the same walls are slabs recording six others, of which the highest in 1557 (under Paul IV.) rose 30 palms 2 inches. In 1704 were inscribed on the two columns in the Ripetta all the inundations from 1495 to 1750, the highest, that of 1598, being 32 palms 6 inches above the ordinary level of the Tiber. Of the immediate causes to which these inundations must be ascribed the Marchese Melchiorri says:—"It is generally agreed that they must be attributed to a double occasion; the east wind, which raising the level of the sea, forces the sands to the mouth of the river and impels backwards its waters, raising their level; also the south wind, which bringing profuse rains, dissolves, by its warmth, the snow on the neighbouring mountains. The ancients took many pains to free the city from this scourge, maintaining embankments on the shores of the river, to which a special magistracy was appointed, to which belonged the conservation of the banks, under the title of Curatores alvei et riparum Tiberis. Tarquinius Priscus projected the changing of its course; Tiberius proposed to deviate the course of the tributary streams, and Claudius formed the celebrated fosses which conducted the water from the Tiber to the port, and from the port communicated with the sea. Trajan restored the canal at the right of the embouchure of the river, which Claudius had opened to facilitate its exit. The provident care of the Pontiffs has dissipated in modern times all fear of the renewal of those extraordinary disasters."

Roman Gardens.

The Romans, like the Greeks, laboured under the disadvantage of a very limited flora. This disadvantage they endeavoured to overcome by arranging the materials they did possess in such a way as to produce a striking effect. We have a very full description of a Roman garden in a letter of the younger Pliny, in which he describes his Tuscan villa. In front of the porticus there was generally a xystus, or flat piece of ground, divided into flower-beds of different shapes by borders of box. There were also such flower-beds in other parts of the garden. Sometimes they were raised so as to form terraces, and their sloping sides planted with evergreens or creepers. The most striking features of a Roman garden were lines of large trees, among which the plane appears to have been a great favourite, planted in regular order; alleys or walks (ambulationes) formed by closely clipped hedges of box, yew, cypress and other evergreens; beds of acanthus, rows of fruit trees, especially of vines, with statues, pyramids, fountains and summer-houses (diætæ). The trunks of the trees and the parts of the house, or any other buildings which were visible from the garden, were often covered with ivy. In one respect the Roman taste differed most materially from that of the present day, namely, in their fondness for the ars topiaria, which consisted in tying, twisting or cutting trees and shrubs (especially the box) into the figures of animals, ships, letters, &c. The importance attached to this part of horticulture is proved not only by the description of Pliny, and the notices of other writers, but also by the fact that topiarius is the only name used in good Latin writers for the ornamental gardener. Cicero mentions the topiarius among the higher class of slaves. Attached to the garden were places for exercise, the gestatio and hippodromus. The gestatio was a sort of avenue, shaded by trees, for the purpose of taking gentle exercise, such as riding in a litter. The hippodromus was a place for running or horse exercise, in the form of a circus, consisting of several paths.

French and English Cathedrals.

In building their churches the French and English seem to have exchanged principles. The reticence and regard for form, proportion and unity which govern the productions of French writers, French painters and French actors were ignored by the architects, and the opposite quality of an intense subjectivity embraced in their stead. In the whole length and breadth of France there is scarcely an instance of a great church built on a carefully-balanced design, like those of Salisbury or Wells. Imagination is allowed to run riot and to pile one upon another shapes which require the harmonising hand of time to justify their existence. The west front of Rouen has been turned by the rain and the smoke of centuries into one of the most poetic things in the world. But as a design it throws to the winds those qualities of fitness and proportion on which French art, as a rule, is apt to over-concentrate its mind. It is just the same at Amiens. The great portals are magnificent; so are the clustered pinnacles and buttresses of the apse; so is the flèche, and so, within, is the soaring height. But none of these things help each other, and each serves to draw our eyes to some complementary defect. The western porches dwarf the west front; the flèche is lost on the huge mass of the roof; the internal height is so great that the vault which ends it has had to be kept thin, poor and mesquin to save weight. All these defects correspond to faults which are common in English painting, in English poems and plays and novels, but which are rare in English architecture. Our cathedrals are often, nearly always in fact, combinations of one style with another. But that is because they are the work of different ages. Those parts which have been carried out at once have a balanced intention which is rare in the cathedrals that were rising at the same moment in France. Where it does occur, as in the west front of Notre Dame, it has a poverty that recalls the less satisfactory features of our own churches. As works of fine art the best of the English cathedrals are the finest in the world, because they avoid the mistakes which spoil Amiens. Their vaults are not forced too far up into the sky, so they have a far greater richness and variety than any to be found abroad. Moderation in height of roof allows towers and spires to be in proportion to the masses beneath them, while greater flexibility of plan gives scope for that varied outline in which churches like Salisbury, York and Durham are absolutely unrivalled.

Jacopo Palma.

His range was more limited than that of some of his Venetian contemporaries, but it left him scope enough for the creation of works which place him in the foremost rank of their common school. Subjects in which dramatic action is demanded he appears seldom to have handled, though his figures show no want of potential energy. He was at his greatest in those compositions for church altars or oratories where the personages command attention by their individual dignity or beauty, while they combine to form a consistent and harmonious whole. So is it in his many "sante conversazioni," in which the figures, grouped together in restful attitudes and filling the foreground, are enframed in sunset landscapes with blue mountain distances; idyllic conceptions, which foreshadow no pain and leave the mind in dreamland. All these come under the head of religious art. But not less attractive, and even more calculated to fix attention and impress the memory, are Palma's portraits of beautiful Venetians, wherein female loveliness, no doubt rather of a nobly sensuous than a highly intellectual cast, is presented to us with all the charms that glorious colouring, brilliant lighting, the finest sense of surface and the most masterly breadth of treatment can lend to a work of art. No studied idealism is perceptible in these heads, but absolute fidelity to nature, though to nature in the fulness of her perfection. The style of Palma underwent changes. His earlier works retain reminiscences of Bellini and Cima; later appears that largeness which, though Bellini led the way to it, was completely developed by Giorgione, Titian and Pordenone; finally a smoother, less thorough mode of practice, combined with a paler sort of colour, constitutes what is termed his "blond manner." As none of his pictures bear a date their chronological order can only be inferred from their style.

NOTES AND COMMENTS.

A TIME that is full of anxiety for the majority of the winners of the Prix de Rome in the section of architecture is when the studies are finished and practice has to be sought in Paris. Those who have commissions to give are aware that the young architect is without experience in construction, and therefore is better fitted to make views of buildings or restorations of temples on paper than to combat contractors. The ex-prize-winner is in the position of a man on whom a barren honour is bestowed, and in order to live he has often to accept a humble post. The late Madame MAILLOT was therefore well inspired when she bequeathed to the Académie des Beaux-Arts a sum of 2,000*l.*, the interest on which is to be applied for the benefit of young architects who have ceased to enjoy the hospitality of the Villa Médicis and are thrown on their own resources. As the daughter of FELIX DUBAN the lady must often have heard of the difficulties awaiting Prix de Rome men, and resolved to aid them by a prize which would be also a memorial of her father. The money will not be granted unless all the conditions imposed on such students have been faithfully complied with.

SANITATION in this country owes much to the late Sir EDWIN CHADWICK, who at one time stood almost alone in advocating the importance of the subject. His interest in the public health was unabated while he lived, and it was his intention to bequeath money for the promotion of sanitary science. His trustees accordingly decided to assign a sum of 700*l.* a year for the endowment of a chair of municipal engineering and a lectureship of municipal hygiene, and a further sum of 1,000*l.* to the purchase of instruments and appliances for the amplification of existing laboratories. These arrangements having been approved by the Court of Chancery and by the authorities of University College, London, the course of municipal engineering and hygiene was inaugurated on Wednesday. It is fitting that the first occupant of the chair is Professor OSBERT CHADWICK, a son of the founder. In his address he said that comparatively little practical instruction could be obtained from lectures alone, however complete, and their utility was vastly increased by a course of practical work. The drawing office was an essential adjunct to academic instruction, and it was above all things necessary that the student should be an expert draughtsman capable of drawing plans with accuracy, neatness and expedition. Engineering was a high art, the art of applying the great sources of power in nature to the use and convenience of man—an art only to be acquired by experience, practice and personal observation. In a well-equipped mechanical laboratory the student may be taught to produce the parts or whole of a machine, but obviously the construction of bridges, roads and the like could not be attempted. The student, however, could be prepared with the essential scientific knowledge and taught how to learn the profession of civil engineer. The course of municipal engineering would comprise a series of lectures by Mr. R. MIDDLETON on waterworks, sewerage works and the like. Examination marks would be awarded, and the student who diligently followed the course would be of value in the office of a civil engineer, and would so reduce the time that must elapse before he could take a responsible position. The lectures on municipal hygiene, founded by the Chadwick trustees, would afford elementary knowledge as to the causes of disease, as to methods of disinfection and as to bacteriology and other points which came strictly within the physician's province, in order that the engineer might give force to his instructions in the design of municipal works. The Chadwick Laboratory would be open to students for practical experiments with air, water, gas and other branches of practical chemistry. To assist the student to practical experience the Chadwick Scholarship of 100*l.* had been instituted, to be paid as an honorarium to a practising engineer taking the student as pupil, or to augment the small salary a student might receive as improver.

THE precise meaning of the phrase "stock bricks" is not always expressed by the definitions in dictionaries, and there is more or less variation between the descriptions given in books about brickmaking. Apparently the signification differs in different districts. A case which was tried in the Brighton County Court on the 7th inst. shows what consequences can follow from the want of uniformity between a builder's and a brickmaker's notions of the words. A firm of builders in Hove entered into a contract with a brickmaker in East Grinstead to supply 16,000 stock bricks at 27*s.* per thousand. The bricks sent were not accepted, for they were considered to be mainly "place bricks" taken as they rose from the clamp without any picking, whilst stock bricks should be picked. Bricks of the kind desired were therefore obtained elsewhere, and the builders claimed 11*l.* 6*s.* for their outlay on the substituted bricks as well as for expenses of carriage. The brickmaker claimed 21*l.* 12*s.*, the price agreed on. Witnesses appeared for both parties. Those for the builders held that stock bricks should be picked, while, on the other side, it was contended that stock bricks meant bricks burned in a clamp or stock, and taken without picking. Judge MARTINEAU said that in his opinion stock bricks meant picked bricks, which would be of a higher quality. Judgment was therefore given for the builders, and the counterclaim was dismissed. Picking may now be considered a sufficient ground for the promotion of place bricks to stocks. But in the early part of the century the difference between the two sorts was admitted to arise from the quality of the material, which could not be got over by any picking. Stocks were said to be "made of a good earth well wrought and with little mixture," place bricks being made of "the same earth, or worse, with a mixture of dirt and other coarse materials, and more carelessly put out of hand." It would be satisfactory if the standard were still materials and workmanship as formerly, rather than an indefinite process of picking which allows of too much latitude.

PEOPLE who are hopeful believe that the strike in Paris among the men employed on various works of construction will soon be settled. Everyone who loves to see France peaceful and prospering will devoutly wish for that result. Londoners especially are under an obligation to wish for the resumption of works, for there can be no doubt the example of their County Council has had much to do with the originating of the disturbance. The French workman has vague ideas about social economy, and when he learns that in London all the important works of the Municipality are carried out without the intervention of contractors, and that very high wages can therefore be paid, he quickly comes to the conclusion that a similar principle should be adopted in Paris. The Municipality of Paris dare not say that the proposed revolution in the manner of executing works would signify increased cost, for that would be a declaration that the hated bourgeoisie were to be mulcted. The Council accordingly have been juggling with the question, and listen complacently while the men in the streets are yelling "Vive la grève générale! Vive la solidarité ouvrière! Vive l'union sociale!" If it were not for Fashoda, we suppose the London County Council would be added to the vivats.

THE directors of the *Berliner Architekturwelt* are desirous to have an illustrated cover for their periodical. To obtain it they have arranged a competition, and offer one prize of 500 marks and two of 250 marks each. The jury will consist of Professors EMILE DOEPLER and SKARBINA of Berlin, Herren JASSOY and MÖHRING, architects, Herr SPINDLER, the publisher, and one of the Berlin painters to be hereafter nominated. The character of the design, which is to be reproduced by a single printing, is left to each competitor, but it is expected to be suggestive of earnestness and distinction, and of course the title of the periodical and the signet, an eagle, will have to be introduced. The designs can be sent in up to December 31.

THE NEW POST OFFICE, AMSTERDAM.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

Introduction (*continued*).

THE tedium of the railway journey across the monotonous plains of Champagne, Picardy and French Flanders is relieved by the great churches of Sens, Troyes, Châlons-sur-Marne, Rheims, Meaux, Beauvais, Amiens, Abbeville, St. Quentin, St. Omer and Tournai. Generally speaking, the predecessors of these glories of France have made way for larger and more splendid buildings which the increasing wealth and population of their cities demanded. Tournai, however, retains its peculiar Romanesque nave and its apsidal Transitional transepts, while the choir and transepts of Beauvais, respectively Geometrical and Flamboyant, soar above the severely simple ninth-century basse œuvre. A more gradual development is offered by the church of Montier-en-Der, near Vassy, where to a very simple Romanesque nave was added in the thirteenth century a First Pointed choir of the same dimensions.

In Champagne there is hardly a town or large village whose ecclesiastical architecture will not repay the trouble of breaking the journey, especially those with which the banks of the Marne between Rheims and Meaux are studded.

Of Early Champenois Gothic the two finest representatives are the choir of St. Remi at Rheims and the greater part of Notre Dame at Châlons-sur-Marne. The apses of these two churches are almost identical in plan and construction; the former retains its simple, solemn Romanesque nave.

The cathedral of Châlons is a fine specimen of Geometrical Decorated, but certain features, notably the imposing range of isolated cylindrical columns, have a very Netherlandish appearance; indeed, Teutonisms are more or less apparent in the majority of the churches in this north-east corner of France neighbouring to the Rhine and Belgium. The long, aisleless choir of another church at Châlons, that of St. Loup, ending in a three-sided apse, recalls Belgian and German examples of the thirteenth and fourteenth centuries, but the detail is infinitely superior. Five miles east of the same city is Notre Dame de l'Epine, perhaps the loveliest creation of the Mediæval architect on French soil. The windows exhibit a curious mingling of Geometrical and Flowing tracery; it possesses that rare feature in France, a rood-screen, and is altogether a structure that has given rise to no little speculation as to the nationality of its designer.

Further eastward we have the cathedral of Metz, whose doubtful *locale* creates a feeling of diffidence in the mind when assigning to it a nationality. The ground-plan of this great church, with the procession path and radiating chapels around its chevet, is French, while the exaggeration of the clerestory at the expense of the aisles is a feature essentially German. The cathedral of Magdeburg offers an example of this, the side aisles there being practically little more than one-third of the whole height of the church, and there being no triforium arcade, a disagreeable effect is created by the portion of unrelieved wall space intervening between the apex of the nave arcade and the string-course below the clerestory windows. At Metz this space is richly arcaded and the openings glazed, but there is no triforium passage of any depth. Fascinating as this arrangement may appear externally, sober reason tells us that such vagaries should not be attempted; but within, this defect is neutralised partly by the perspective and by the rich old stained-glass which not a few of the windows in this part of the church have succeeded in retaining. There is a wealth of detail in Metz Cathedral, especially in its foliaged ornament, and if the traveller sees it after the poor Middle Pointed work of the Rhine provinces, the relief is most agreeable; but should he approach the capital of Lorraine through such a richly churched district as the Ile de France he will experience a feeling akin to disappointment, which is, however, to some extent compensated for by the vastness and *élancé* character of this, the most imposing structure of its class in Europe.

In the Troyes district of Champagne we find a peculiar type of Flamboyant pervading the churches of its towns and villages, its leading characteristics being absence of capitals to the piers, the arch ribs dying off into them, and of foliation or cusping to the reticulated tracery of its windows. To an English eye, accustomed to the richness of our contemporary Perpendicular, such work appears tame and nerveless, but there is much that is grand and imposing about the scale of these churches, and this is aided in no inconsiderable degree by their ancient fittings, many having succeeded in eluding the hand of the "restorer."

In the city of Troyes churches cluster almost as thickly as in Cologne. Not a few of them are rich in old stained-glass, but especially that gem of thirteenth-century Gothic, the unfinished church of St. Urbain. The vitreous decoration of the cathedral of St. Peter and St. Paul in the same city is unusually splendid; indeed, nowhere in Europe can this particular branch of ecclesiology be seen in such profusion and magnificence as in the French cathedrals north of the Loire.

The towns of Melun, Montereau and Pont-sur-Yonne, which occur on the line of route from Paris to Sens, contain much interesting work, as do Joigny and St. Florentin, which are passed in going from the latter archiepiscopal city to Auxerre. The Early Renaissance in the churches of Joigny and St. Florentin is particularly rich and interesting. Troyes and Châlons can be reached either from St. Florentin, a line of route of comparatively recent opening, or by the older and more interesting one from Sens, passing through Villers l'Archeveque, where a few hours will not prove misspent.

We now come to the Ile de France, a small province, it is true, but enshrining within it some of the noblest buildings of the Middle Ages. Much fine work will be found in the Seine-side village churches lining the railway from Paris to Mantes, but these are eclipsed in architectural splendour and importance by those along the Oise, and for the exploration of which the town of Creil—itself not wholly uninteresting in an ecclesiological point of view—will be found an admirable centre. And not for these only, but for the beautiful architecture of the country of the Soissonaise, the cradle of Early Pointed French Gothic, will Creil be found a convenient *point de départ*—Senlis, Compiegne, Noyon, Laon, Soissons and Braisne all being within easy reach. As a whole the village church architecture of France may be said to fall far below that of England, but this succession of churches alluded to above as standing on the banks of the Oise—St. Leu d'Esserent, Champagne, Persan-Beaumont and Auvers, together with others of equally beautiful detail—is probably surpassed only by that glorious line extending all the way from Sleaford to King's Lynn, or by that remarkable Nene Valley series between Wellingborough and Peterborough. The above-mentioned line of churches is met going Paris-wards from Creil. In the direction of Beauvais are the contiguous villages of Cires and Mello, each with a noble and refined specimen of Early Pointed, while a short walk from Creil brings the ecclesiologist to Nogent les Vierges and Villers St. Paul. In all these churches the late twelfth and early thirteenth-century Gothic of France can be seen in perfection.

But of all the French provinces, that of Normandy, from the fact of its history having been for so many years interwoven with that of his own country, is to an Englishman indubitably the most architecturally interesting. Perhaps nowhere in France do we see all the styles brought to such a degree of perfection as in this the most delightful of her provinces. The Romanesque style of Normandy must not, however, be looked for in its capital, the cathedral of Rouen and other churches of that enchanting city having been rebuilt during the First and Middle Pointed epochs. But in the department of Calvados it is difficult to point to a village that does not present a specimen of "Norman" work, as for instance Bernieres, Fontaine le Henri, Bieville, Thann and Fresne Camilly, all within easy distance of Caen, which, with its two great mainly Romanesque abbatial churches of St. Etienne and La Trinité and its desecrated St. Nicholas, is quite a mine of study. Other large and important specimens of Norman work are the abbey church of Montivilliers and the humbler St. Honorine at Graville, near Havre; Cerisy, between Bayeux and St. Lo; St. George de Bocherville, near Rouen; and the collegiate church of St. Hildevert at Gournay, in the Pays du Bray, on the line of railway from Dieppe to Beauvais, and richest of all in the nave of Bayeux. Between Caen and the last-named city

is the exquisite First Pointed church of Norrey, quite a cathedral in miniature as regards its eastern portions. The long reed-like shafts in the belfry stage of the central steeple here, as well as in those of the neighbouring church of Bretteville, of St. Pierre and St. Jean at Caen, of Bernieres and of Langrune (two seaside village churches of great importance and interest) are an evident localism, and one perhaps unexampled in artistic excellence and gracefulness. In Normandy the First Pointed style is represented on a grandiose scale in the choir of St. Etienne at Caen, in the nave clerestory and choir of the cathedral at Bayeux, in St. Pierre at Lisieux, in the cathedrals of Coutances and Rouen, and in the nave of that at Seez. Other fine examples are the choir arcades and transepts at St. Jacques, Dieppe, the collegiate church of Eu, the abbey at Fecamp, and St. Pierre-sur-Dives.

Geometrical Decorated of a very high order is met with in the transepts of Bayeux, in the side chapels to the naves of Rouen and Coutances, in the transepts and choir of the cathedral at Seez, in St. Etienne le Vieux at Caen, and in the exquisite chapel (a contemporary with the Sainte-Chapelle at Paris) at the east end of the abbey of St. Germer, near Gournay. St. Ouen at Rouen—a perfect church of the fourteenth century—is in a later phase of Middle Pointed, melting into the Flamboyant, a style perhaps nowhere worked with such a degree of refinement and vigour as in Normandy.

Examples are numerous, but those worthiest of citation are the west front of the cathedral at Rouen; St. Maclou in the same city; the church of Caudebec, on the Seine between Rouen and Havre; the porches of the churches at Harfleur and Louviers; the tower of the Madeleine at Verneuil, and the upper portion of the nave of St. Jacques, Dieppe.

From Normandy we pass into Brittany, which, in architecture as in everything else, seems to have been behind the rest of France, but portions of the churches of Dinan, Dol, Folgoat, Guingamp, Nantes, Quimper, St. Pol de Leon, and Treguier are fine. Specimens of Romanesque or Early Pointed are rare, and much discrimination is required in fixing the dates of buildings, many of them having an air and style more ancient than they really are. The use of granite as a material is very frequent. Flamboyant, of a peculiar type, is the style par excellence of this corner of France, while the English look pervading many of the details and plans, and the manner in which so large a number of churches have retained their ancient primitive furniture delights the antiquary, the ecclesiologist and the lover of the picturesque. In the rood-lofts of Folgoat, St. Fiacre and Lambader we find a minuteness and delicacy of carving, especially in the foliaged ornament, hard to find among the works of an earlier and purer age. Its roadside crosses are, *inter alia*, a feature of Brittany; hardly a single point of intersection of two roads can be passed which is not marked by a cross—more or less mutilated—oftentimes restored by the piety of the present generation.

(*To be continued.*)

LEATHERHEAD, MICKLEHAM AND DORKING.*

LEATHERHEAD was known in the time of Alfred as Leodre, in Domesday as Ledret—the etymology is quite uncertain,; the British words Llethrod, Llethredd, which are said to signify a sloping situation, like that of Leatherhead on the banks of the Mole, down to which extensive gardens slope from one of its streets, have been suggested, but without much authority.

Leatherhead must at one time have been a place of considerably more importance than at present. The Sheriff's County Court was anciently held here and was only removed to Guildford at the end of the reign of Henry III. The river is crossed by a bridge of fourteen arches, close to which is "The Old Running Horse," a small inn said to be the hostel in which Elynour Rummyng "brewed moppy ale and made thereof port-sale," as celebrated in more curious than edifying verse by Skelton, Henry VIII.'s laureate. A portrait of the lady appears on one side of the house. According to tradition Elizabeth slept here on one of her visits to Slyfield, being unable to cross the river owing to the flood. The church at Leatherhead, which is of no great interest, was granted to the priory of Leeds in Kent about the middle of the fourteenth century, and from which time it principally dates. In the north-east wall of the transept is a curious squint. I am told the stained-glass in the east window was collected by a vicar, now passed away, from Rouen in Normandy.

Leaving Leatherhead we wend our way to the banks of the inconsiderable but not inglorious stream, the Mole. It has been noticed in lays of some of our most eminent poets. Spenser, Drayton, Milton, Pope and Thomson all mention it with epithets appropriate to its character.

In the episode of the marriage of the Thames and Medway Spenser introduced this river at the bridal feast in the following curious personification:—

> And Mole, that like a nousling Mole, doth make
> His way still underground till Thames he o'ertake.
> *Fairy Queen*, book iv. canto xi.

Drayton, in the seventeenth song of "Polyolbion," in amusing quaint poetic style represents Thames highly enamoured of "soft and gentle Mole." Tame and Isis, displeased at the passion of their son whom they intended for "the goodly heiress of Kent," the Medway—

> Employ their utmost power to hasten him away
> But Thames would hardly on, oft turning back to show
> From his loved Mole how loth he was to go.

Old Homesdale, the mother of the Mole, was fabled by the poet to be similarly aggrieved:—

> But Mole respects her words as vain and idle dreams
> Compared with high joy to be beloved of Thames,
> And headlong holds her course his company to win,
> But Homesdale raised hills, to keep the struggler in;
> That of her daughter's stay she need no more to doubt,
> Yet never was there help but love could find it out;
> Mole dig herself a pall by working day and night,
> According to her name to show her nature right.
> And underneath the earth for three miles space doth creep,
> Till gotten out of sight quite from her mother's keep;
> Her foreintended course the wanton nymph doth run,
> As longing to embrace old Tame and Isis' son.

Milton characterises this river as

> The sullen Mole that runneth underneath.
> *Miscellaneous Poems*, vol. iii. p. 321.

But Pope in his "Windsor Forest" uses the same epithet—

> The sullen Mole that hides his diving flood.

In Thomson's "Seasons" (Summer), Drayton's "soft and gentle Mole" is mellifluously amplified into

> The soft windings of the silent Mole.

More recently (1859) an entire poem in blank verse has been dedicated to the devious wanderings of this stream by Miss Bethune, whose work was privately printed in aid of funds for building national schools at Leatherhead. She traces the river from "its lonely fount" in "far St. Leonard's Forest" to the "solemn groves" of Betchworth, where

> The lingering waters of the brimming stream
> Sweep slowly round the wooded bank, so soft
> The gentle current that it scarcely rocks
> The floating water lily.

Then progressing with the tortuous stream around the base of Box Hill to the proud elms which "shoot forth their boughs" near Burford Bridge, she pursues its track by the "sunny slopes of Norbury," "Thorncroft meads," and the "many arched" bridge of Leatherhead to Stoke d'Abernon, where

> In its waveless course
> The Mole glides on, through quiet meadows, rich
> In yellow cowslips, and the tall foxglove,
> With its deep purple bells, dew laden.

This river, which was anciently called the Emele, Emlyn and Ernley stream, gives name to the Hundred of Ernley bridge, or as it is spelt in Domesday Book, "Amele-brige." The etymology of the name may be referred to the British or Celtic word Melin or Y Melin, the Mill, and thus indicate the Mill river—an opinion which receives corroboration from the Domesday record, wherein nearly twenty places are mentioned as possessing mills which must have been situated on this stream. Even its present appellation, the "Mole," by which it was also known prior to the Conquest, will admit of a similar origin, the Latin "mola" signifying a mill, and thus coinciding perfectly with the more ancient phrase. These inferences seem far more reasonable than that the river should derive its name from the vague comparison of "betaking itself to subterraneous passages like a mole," which Camden first suggested, and late topographers have unhesitatingly accepted his suggestion.

There seems little doubt that the river formerly disappeared during dry weather in the places called "Swallows" between Betchworth and Burford Bridge, when the stream flowed through or underneath the gravelly bed of the river; but the Rev. E. V. Brayley, F.S.A., in his "Topographical History of

* A paper by Mr. G. H. Lindsey-Renton, read at a visit of members of the Upper Norwood Athenæum.

Surrey," published in 1848, says :—"He may remark that the appearance of the 'Swallows' near Burford Bridge is now extremely different from the view attached to that account, the rapid current of the river during high flood having washed away much of the ground as well as the underwood and several trees." As you will have observed this afternoon, the undercut appearance of the banks in many places bears out Mr. Brayley's suggestion that much of the ground under which the Mole once ran has since been washed away.

Passing through some of the most beautiful scenery to be found in the county, we eventually find ourselves in the old village of Mickleham ; the chalk hills and undulating grounds of this parish, diversified as they are by the verdant valley of the Mole, and clothed with woods and plantations, give an extent and variety to the scenery which can scarcely be equalled in any other part of Surrey. The Roman road, styled Stane Street, passed across Mickleham Down, where its course may yet be traced, and Roman coins and fragments of Roman pottery have been found there.

Mickleham, the little dwelling-place, or as Mr. Brayley says it is called in some old deeds, Littleburgh or Mikelham—the latter is the spelling in Domesday Book—derives its name evidently from what is now considered Scotch, but formerly prevalent here,

Mony a mickle mak's a muckle.

The manor was held by the celebrated Bishop Odo, half-brother to William the Conqueror, but escheated to the Crown in consequence of the rebellion of that turbulent prelate in the reign of William II. (Rufus). Henry I. granted it to Robert de Mikelham to hold at a rent of 10*s.* a year. In the tenth year of Edward III. John Dewey and Margery his wife held the manor of the king in capite at the rent of 12*s.* and as castle guard to the castle of Rochester. Later it passed to John de Aperdele the younger, who in 1367 committed a felony, and being outlawed his estates escheated to the Crown. Edward III. in 1370 granted Mickleham to William of Wykeham, Bishop of Winchester, in fee, but in what manner it was afterward dissevered from that see is unknown, as well as its further descent until we find it in the hands of the Stydolfs in the reign of Henry VII. ; from that family the manor passed by successive changes, sales, &c., to the Talbot family, who became possessed of it in 1780, and one of whose descendants is the present possessor.

Mickleham Church is dedicated to St. Michael, and is a rectory in the deanery of Ewell. In the twentieth year of Edward I. the living was valued at 20 marks, but in the king's books at 13*l.* The registers commence in 1549, but are deficient during several years of the interregnum. Under date 1675 it is stated that "on the 19th Sunday after Trinity, John Lucas, senr., Lydia, his wife, and three sons John, Henry and James, and Anne, wife of Thomas Williter, were denounced excommunicated," but the cause is not assigned. In 1678, June 9, Second Sunday after Trinity, Anne Williter was absolved from excommunication.

Many of the Williter family who resided at West Humble have memorials in the churchyard.

The church is noticed in Domesday Book, and still exhibits distinct traces of Anglo-Norman architecture, particularly in the chancel and western doorway. In the years 1822 and 1823 the interior was renovated, and the north aisle about 1842.

In 1848, Brayley describes the church as consisting of an entrance porch and western tower, a nave and aisles, a chancel, a sepulchral chapel (annexed to the manorial seat of Norbury), and a robing-room and vestry of recent date. He says the tower is of a massive character and is further strengthened by buttresses of considerable projection ; it contains three bells and is surmounted by a shingled spire and weathercock. During repairs in 1823 the covering slabs of two ancient tombs were found in lowering the ground opposite the north doorway ; these have been placed in the porch and raised upon brickwork to form seats. The surfaces are much defaced, yet the foot of a cross appears upon each, with the remains of a supplicatory inscription in the Longobardic character. Brayley had some right feeling even in those days when the art of reverend restoration was so little understood, and he mildly rebukes the architect who renovated the building in 1823 for a "somewhat reprehensible deviation" from the original form "by substituting square piers for the cylindrical shafts or columns by which the arches were sustained." This, however, I believe was altered at a recent restoration.

On the north side is a decorated altar tomb in memory of William Wyddowson, a former patron. In front are three panelled compartments containing quatrefoils and shields ; on the central shield is the armorial bearings of the Mercers' Company and on the right a man on horseback, the other is defaced. An enriched canopy and panelled arch surmount the tomb, at the back of which are small figures in brass of a man and woman kneeling with a supplicatory scroll or prayer issuing from the mouth of each ; the man is represented in a citizen's gown with long hair, his wife in a long pendant headdress and a rosary at her girdle ; between them are the Mercers' Arms on brass, and beneath the whole the following inscription :—

Here lyth the body of Wyllyam Wyddowsown, Citizen and Mercer of London and of ye parych chyrch of Mekyllham late patrone ; and allso here lythe ye body of Jone hys wyfe the whych dyssesyd the xxvii. day of Septe'byr the 6th yere of King Hary the VIII., on whose soullys God have mercy. Amen.

Over the chancel arch are the helmet and banner of Sir Francis Stydolfe who lies buried here with many of his family ; several other memorials and tombs but not of any noted person.

Juniper Hall, near the church, is more especially known as having been an asylum during the French Revolution for a number of distinguished emigrants, Comte de Nartonne, Duc de Montmorency, Madame de Broglie, Madame de Staël, M. Girardin, Princesse de Zein, Talleyrand and a M. D'Arblay, who married the lively Fanny, daughter of Dr. Burney, whose "History of Music" is still extant, and who herself has written some amusing recollections of her life at the court of George III.

Leaving Mickleham we wend our way to Dorking, and as we enter the old Surrey town, our minds irresistibly recall the adventures of Mr. Stiggins at the Marquis of Granby, his devotion to "pine-apple rum," and his subsequent involuntary bath in the horse-trough into which he was assisted by Weller father and son. How marvellously has Dickens delineated the charms of this typical provincial town ; one can readily fancy the coaching days of sixty years ago, old Weller slowly wending his way to his inn, and his choking indignation to find the "Shepherd" in the bar parlour, insinuating himself into the graces of Mrs. Weller, his unctuous welcome to the "man of sin," and his subsequent attention to the particular tap devoted to the spirituous produce of the West Indies.

Here at Dorking the old Dutch merchants used to visit for the purpose of partaking of a special dish to which they were devoted, known as "Water Souchy of Perch."

Dorking, or, as it is written in Domesday Book, "Dorchinges," was given to Gunreda, his daughter, by William the Conqueror, on her marriage with the first Earl of Warren and Surrey, and through him by descent on the female side to the Dukes of Norfolk, whose eldest sons, as you are probably aware, bear the courtesy title of Earl of Surrey.

It would be superfluous for me to expatiate upon the beauties of this neighbourhood. Are they not written in many papers of the various rambles of which Dorking forms the centre? Suffice it to say that I hope whatever may be the shortcomings of this from an antiquarian or archæological point of view, you have enjoyed the delightful walk through one of the prettiest parts of this unequalled county.

RECENT DISCOVERIES AT POMPEII.

THE excavations at Pompeii, says a Naples correspondent of the *Times*, have been continued during the past year and have resulted chiefly in the discovery of small houses containing objects of secondary interest and importance. In the neighbourhood of the Gate of Vesuvius a portion of the city wall belonging to the earliest period of Pompeian building was laid bare, and is interesting, as it is apparently more ancient than such other portions of the wall as have been discovered. It appears to be of Oscan construction, being built of large blocks of rough stone neatly joined without mortar, and resembles somewhat the façade of "The House of the Surgeon," though the stones are larger and not so smoothly faced. This section of the excavations being exhausted, the ground already appropriated being finished, the director determined to excavate the small corner near the "Sea Gate," which was the only unexcavated spot in that part of the city. Experts had long been anxious to see what lay buried there, for there was a portion of a very large and handsome red marble pillar, which had long been above ground, and had given rise to sundry conjectures. On removing the soil the site was found to be occupied by the foundations of a temple which was in course of construction at the time of the destruction of the city in 79 A.D. This is particularly interesting, because it was supposed that all the sacred edifices of the city had been discovered long ago, no important deity being without a representative temple ; but unfortunately there is nothing in the rudiments of the temple before us to indicate to whom it was to be dedicated on its completion. It is evident that, though very small, it was intended to rival in its decoration any temple which existed in the city ; and though it had scarcely risen above the ground level, the marble architraves, carved with the usual egg-and-tooth moulding, are lying around it ready to be put up, and the Corinthian capitals, some finished and others only partly executed, are displayed in the enclosure, as well as the base of a pillar upon which the mason was at work at the time of the catastrophe which overwhelmed the city. The tool-marks on this base are clearly perceptible, and look as if the workman had only just left his task. As to the handsome red marble

pillar to which we have alluded, it is reasonable to conjecture that it was the base for the statue of the god, as it is about 4 feet long, and the only piece of coloured marble found on the site. The partly executed capitals are extremely interesting, as showing the methods of the Roman artist who was engaged upon them, while those that are complete are very good specimens indeed, considering that they belong to an age of decline.

If Pompeii itself has not been productive of sensation this year, a small excavation on private ground only a few yards outside the walls has more than made up for this by revealing one of the finest and most interesting mosaics of antiquity. Surrounded by a most exquisite garland of flowers, with a theatrical mask thrown in here and there to break the pattern, is a picture representing a group of seven philosophers, one of whom is seated with a papyrus in his hand, and the others are grouped round listening to him. In the background are some ruined pillars, and in the right-hand upper corner is a representation of the Areopagus of Athens, with its rocks and buildings. The mosaic is polychrome and in diminutive cubes of very fine workmanship, equal in merit to those by Dioscorides of Samos in the Naples Museum, which are believed to be the only signed mosaics of antiquity. It is about 3 feet square, and was, no doubt, intended for the centre of the pavement of a room. It had probably never been used and was a new mosaic, because it was not found on the ground, but leaning against a wall, showing either that it had been moved from some other place or that it was about to be put down for the first time. Its perfect condition leads one to prefer the latter conjecture. The Government has purchased it from Signor D'Acquino, and it will shortly be exhibited to the public in the mosaic department of the Naples Museum.

It is generally admitted that the earliest mosaics in Italy date from about 80 B.C., and there can be no doubt that in many cases they were reproductions, or, at all events, traditions of famous pictures. In the case before us, the sketch of the Areopagus, concerning the identity of which there can be no doubt in the mind of any one who knows the spot even in its present state, displays the Greek origin of the work, and the scene depicted must either be some celebrated discussion on "Mars Hill," or, what is more unlikely, a casual group of one of the Attic schools of thought such as might be seen there any day. At any rate, a sketch of the Areopagus which is recognisable at the end of the nineteenth century is no mean treasure, and we are encouraged to hope that one or other of the archæological schools of Athens may be able to throw some light on the subject of this interesting mosaic.

It is not thought likely that the D'Acquino excavations will produce other objects of great importance, as the house so far has shown no signs of being anything more than a suburban villa. After the rich find of silver which was made some three years ago in a house about a mile from Pompeii, and presented by Baron Rothschild to the Louvre, it is unsafe to speak with too much confidence, but the above is the opinion of the expert who is in charge of the excavation.

THE CHURCH OF THE REDEEMER, JERUSALEM.

ONE of the reasons which have inspired the visit of the Emperor of Germany to Jerusalem is the opportunity afforded to dedicate the new Church of the Redeemer, of which the corner-stone was laid five years ago. The ceremony will take place on October 31.

According to a correspondent of the *Times* in Jerusalem, there is much in the history of the site of the new German church that is well worth noting. It occupies the eastern half of the large enclosure to the south of the church of the Holy Sepulchre known as the "Muristan." This plot has historic mention as early as the reign of Charlemagne, who devoted much attention to the holy places of Jerusalem. On this very ground he erected a hospice for pilgrims. Bernhard of Eichstadt, a monk, acknowledged its hospitality in 870, and spoke of a church here, with Western rites, called St. Maria Latina, in charge of Benedictines. The peace that lasted during Charlemagne's friendly intercourse and exchange of costly presents with Khalif Haroun El Rachid ceased when the Holy Land came under the power of the Egyptian khalifs. This hospice and church, in common with all the churches of Jerusalem, were destroyed. This was in 1010, under the rule of Hakem. After his death intercourse with the West was renewed through Italian seaports, and churches were rebuilt. In 1063 merchants of Amalfi purchased the ground in question and built a hospice. For its service there was founded a small brotherhood of hospitallers, and this grew in a few years into the powerful and celebrated order of the Knights of St. John, which added warlike enterprises to its deeds of mercy in caring for pilgrims and the sick. This knightly spirit was fostered by the circumstances of those times when the Crusades were undertaken by which Jerusalem was wrested from the Turks of Asia Minor. This new order of knights filled their area with great structures—the church of St. John the Baptist; a hospital supported by 124 columns, where 1,000 pilgrims could find shelter; the palace of the master of the order, the dwellings of the knights and an armoury and mews. Upon the north-east corner of the enclosure stood the church of St. Mary Major, and adjoining it on the south the cloister of the affiliated order of nuns. This church was built in the old French style, and resembled the church of St. Anne, now standing near the St. Stephen's Gate. It is this church of which the ruins were uncovered by the German architects a few years ago. Its restoration was undertaken and is now approaching completion under the patronage and close personal interest of the German Emperor. An ornamental arch bearing designs symbolic of the twelve months of the year, which originally formed the northern entrance, was found standing, and now occupies its ancient place in the new structure and forms its most interesting feature. The cloister also was found in good preservation, and may now be seen much as it was in the days when Baldwin was king in Jerusalem.

Christian rule terminated within a century. In 1187 Saladin conquered the city and took up his quarters in the property which had belonged to the Knights of St. John. The cloister, from which the nuns had fled, he converted into a madhouse, called in Arabic "Muristan," which name the whole area has since borne. The Knights of St. John afterwards established themselves in Rhodes, and later in Malta, whence they were finally driven by Napoleon. But they have never ceased to exist, though the Reformation divided the order. The successors of those in Malta, who are called the Knights of Malta and are Roman Catholics, are found to-day in the house of the order and a hospital south of Jerusalem, at Santur, a little more than half-way to Bethlehem. The Protestant representatives of the order flourished in Prussia and were rich in landed possessions until during the Napoleonic wars these possessions were seized by the Prussian Government. Later the order was restored by Frederick William of Prussia. In its modern form it is devoted to deeds of mercy, supporting many hospitals and homes for the aged. It has a small but well-conducted hospice in Jerusalem, and will probably build a spacious one on this very site, upon which the order was founded. The membership of the German order is confined to princes and the nobility. The English order bearing the same name includes all classes and numbers women as well as men in its ranks. An ophthalmic hospital in Jerusalem is under the banner of this English order.

After Saladin's death the buildings of the "Muristan" were neglected and became mere ruins, and part of the land was sown with barley. Finally, the western half came into the possession of the Greek Patriarch, by whom the ruins of the church of St. John Baptist have been recently uncovered.

As in recent years German Protestant interests have increased in the Holy Land the Emperor William turned his eye upon this eastern half of the former site of the Knights of St. John. But it was impossible to acquire it by purchase, for it wbs "wakf," *i.e.* inalienable ecclesiastical property, and only obtainable by the will of the Sultan. All efforts to secure it failed until a favourable opportunity to bring forward a request for it occurred on the occasion of the opening of the Suez Canal, when the then Crown Prince Frederick visited Jerusalem. The request was granted, and the Sultan presented the plot of ground to King William on November 7, 1869, in proof of his friendly feeling towards the Crown of Prussia. Thus, after an interval of 700 years, this birthplace of the Order of St. John came again into Christian possession, and will before long again be in part appropriated to its ancient and honourable use as a Christian hospice. The hospice is to be erected to the south of the cloister upon the arches that enclose to this day the vast subterranean chambers, one beneath another, that have existed from the time of Constantine. The refectory of the cloister was fitted up as a place of worship, and in July 1871 was opened with 200 sittings.

In digging down in order to lay the walls of the new church on the old foundations it was found that only one pillar rested on the rock bed, the rest being built on débris. Hence followed one year and a half of anxious and expensive labour, which added 300,000 marks to the estimated cost of the building, shafts having been sunk to a depth of 10 to 14 metres.

The Truro Cathedral building committee met recently, when the treasurer reported that after paying nearly 2,000*l.* for preparing the foundations, 27,500*l.* remained available for building the nave. The architect was instructed to have specifications for the nave prepared, as well as a sketch of that portion of the interior. It is suggested that that should be the limit of the present undertaking, tenders for which will probably be invited in January.

VENTILATION AND WARMING.

(Continued from last week.)

Section III.—Day-Rooms.

THERE seems to be no general understanding as to the proportion which should exist between the size of the day-room and the number of children it is intended to accommodate. I have computed the proportions for the ten schools, taking as the number to be accommodated that mentioned by the superintendent, and not the total number of beds in the boys' or girls' dormitories, as the case may be, because I supposed the superintendent might be aware of some occupation which would withdraw a certain number of boys or girls from the day-room at the time when it is usually occupied. The results of the computation show that the allowance of floor area of day-room per child varies from 13 square feet at Hornchurch to 2·1 square feet at Leavesden for the boys, and from 13 square feet again at Hornchurch to 5·3 square feet at Forest Gate for girls, leaving Edmonton out of account, where the day-room provision for girls is of a very promiscuous description.

In the absence of any specification of the precise object to be aimed at by the provision of day-rooms of such varying relative capacity, I may be allowed to suggest one for which even the smallest might be made available, namely, that it should afford the children an opportunity of getting warm on a cold day if, as must frequently happen, they become chilled by exposure to the cold. The free supply of heat to a cold child appears to me to be almost as much a necessity as the free supply of water to a thirsty one, and I know of no part of the daily routine of the life of a child in the schools which offers a free opportunity for an exceptionally cold child to get warm. For this purpose an open fire has advantages which other methods of warming do not afford, and I think it is desirable that each day-room should have one or more good open fires kept burning and accessible to the children during cold weather.

The supplementing of the open fires by steam pipes or hot-water pipes, to bring the whole of the room up to a reasonable temperature (with a minimum of say 56 deg. F.), is of great advantage, but I do not think it wise to allow the hot-water and steam heating to displace the open fire altogether. Where hot water or steam is introduced it would, I think, be better to concentrate the heating under the windows, so that the incoming air may be warmed when the windows are opened for the purpose of ventilation. The practice of carrying one or more steam pipes all round the room, and protecting it by a low shelf to be used by the children as a seat I regard as satisfactory. It would, in my opinion, be better to concentrate the heating surface under the windows and thoroughly protect by slag wool or other heat-insulator the parts between the windows. Where open fires are used I think it is undesirable to have cold-air openings at the floor level. The cold air entering will always find the floor very quickly, and in the winter special ventilators near the floor are therefore unnecessary. They cause the temperature at the floor to be much too low for satisfactory warming, and I would willingly see the floor ventilators in day-rooms provided with doors that can be closed in winter. In the summer every opening is of advantage, and the covers to the floor ventilators should be removed as soon as artificial heating is given up.

Quantity of Air Supply.

Taking the case of the Hornchurch day-rooms, where there is an allowance of 13 square feet for each child, we have the problem of warming and ventilating a room 26 feet long by 15 feet wide, containing thirty children. It is the same problem again as the ventilation of a dormitory in an exaggerated form, on account of the smaller allowance of cubic space. But a frequently-opening door and less prolonged occupation may be regarded as items on the other side of the account, and probably the provisions suggested in the case of a dormitory would meet this case also tolerably well. The desirability of having an open fire introduces a somewhat serious modification, for the presence of so many children would of itself raise the temperature, and a somewhat smaller allowance of hot-water pipe would be sufficient. It might, perhaps, in the particular case of Hornchurch, be sufficient to replace the existing grate by one provided with an ample air supply. For the other schools it seems desirable to provide additional day-room accommodation.

The infants' day-rooms and nurseries are on a somewhat different footing as regards warming and ventilation from the day-rooms for the older boys and girls. They are occupied for long periods, and should therefore come under nearly the same rules as dormitories. As the allowance of cubic space is generally much smaller for a day-room than a dormitory, rooms of the same size require more air as day-rooms than as dormitories; an open fire may also be regarded as a domestic necessity in a day-room for the smaller children. Arrangements similar to those suggested for dormitories, with less heating surface in the hot-water pipes on account of the open fire, would probably be satisfactory.

Again, I think it is important that instructions as to the proper temperature to be maintained, and the mode of using the appliances for warming and ventilation, should be suspended in the rooms.

The covered sheds that are used to supplement the accommodation of the day-rooms should be provided with openings in the roof if there is no through ventilation, even when they are very freely open in front. It is astonishing how offensively ill-ventilated a lean-to shed in a protected situation may be when more or less crowded with children, although there may be wide openings in front, if there be no cross ventilation and no openings in the roof. We found an example of this at Leavesden, where the covered court is heated by steam pipes, and the experience of the superintendent at Leytonstone, where there are well-built covered play-sheds on each side of the hall, bears out the same view.

Recommendations as to Day-rooms.—1 and 2, as for dormitories. 3. That in each day-room during cold weather (when the external temperature is lower than 50 deg. F.), or when the external temperature falls suddenly after a spell of warm weather, or in very damp weather (when the external temperature is below 55 deg.) at least one good open fire be kept burning. That the warming be supplemented by hot-water pipes or steam pipes (preferably the former), supplying coils or radiators underneath the windows sufficient to keep the temperature of the room, when the windows are open 4 inches at the top, up to 56 deg. F. for boys' and girls' day-rooms, and up to 60 deg. F. for infants' day-rooms and nurseries. 4. That suitably-covered openings be made in the roofs of play-sheds and covered courts that are not properly provided with arrangements for cross ventilation. 5. That cold air openings at the floor level be provided with doors that may be closed in very cold weather and opened when no artificial warming is required.

Section IV.—Dining-Halls.

Temperature Observations.

The dining-halls are used for so short a time, and they are as a rule so amply supplied with windows on both sides or other means of ventilation, and they have such an array of doors repeatedly opened, that the question of ventilation becomes subordinate to that of warming. Any odour suggesting closeness when they were inspected seemed referable more properly to persistent scouring of the floor than to the stale smell of previous meals that is so characteristic of an ill-ventilated dining-room. If some satisfactory method of dry cleaning could be adopted for the hall floors, there would probably be little to complain of as regards the freshness of the air. I have not sufficient experience to make any recommendation on the point, but it is a point in which I believe great improvement is possible.

It is perhaps difficult to lay down any precise rules as to what ought to have been the range of the thermometer, but I should have regarded an initial temperature of 57 deg. and a final temperature of 60 deg. as a very satisfactory indication of well-managed warming and ventilation. At Edmonton, where the temperature before dinner approached nearest to 57 deg., direct cross ventilation is not possible, because a range of workshops lies adjacent to the dining-hall on the west side, and hall windows on that side communicate with the workshops, and not with the external air.

The adjustment of temperature and ventilation is, in my opinion, much more a matter of careful management than of apparatus in the majority of cases; on that account I am of opinion that the effect of carefully-drawn instructions for the use of the apparatus already provided should be ascertained before making any alteration.

Before any recommendations are formulated as to alterations in the apparatus for warming or ventilating the dining-halls, I think it would be desirable to obtain some more definite information as to the manner in which the temperature changes in them during the day. For this purpose a self-recording thermometer, which records the temperature for a week, is the most suitable apparatus. There are several patterns in the market and they are not very expensive. These records would be of great use in guiding the management of the apparatus for ventilating and warming, not only in the dining-halls, but in day-rooms and dormitories, and one specimen of the apparatus could be moved from one place to another for successive weeks. I think the advantage to be obtained from the records would more than compensate for the cost of the apparatus.

Recommendations as to Dining-halls.

1. That provision be made for the regular cleaning of the heating apparatus as indicated in the above remarks.

2. That a paper of instructions be issued directing what steps should be taken to secure that the temperature of the halls should be raised to between 57 deg. F. and 59 deg. F.

before the commencement of a meal, and that the ventilation should be sufficient to prevent the temperature rising more than 3 deg. F. during the half-hour of meal times.

3. That a self-recording thermometer be placed occasionally in each of the dining-halls during the winter months and the records kept for inspection.

SECTION V.—SCHOOLROOMS.

General Consideration of the Ventilation of School Classrooms.

Before considering the special points in connection with any particular school, it will be well to lay down the general principles upon which whatever criticism I have to offer is based. First, as to the amount of air required for ventilation. Since the rooms can be thoroughly aired by opening the windows fully in the "recess," after about an hour's use we may restrict the amount of air to that required for keeping the air within the limits of respirable impurity for an hour. This consideration enables us to reduce the supply from that required for ventilating with a view to continuous occupation in the ratio of two to three. Dr. de Chaumont fixed it at 2,000 cubic feet per hour for an average audience. If we allow some deduction on account of the members of the audience in our case being smaller than the average, we may, perhaps, put down 1,500 cubic feet per hour per child as the amount required. Dr. Carnelley, in his report on the "Heating and Ventilation of Schools," wherein he supported the view that mechanical ventilation by propulsion is the best method in practice for ventilating schools, quoted numbers between 800 and 1,400 cubic feet of air per head of accommodation as supplied by mechanical arrangements in good order at certain schools reported upon, so that 1,500 cubic feet per hour would seem to be a good allowance. This allowance per head implies, however, an enormous flow of air through the windows or other openings by which air is supplied for ventilation. Take, for instance, the Sutton classroom No. 97. There are two windows in the north side, three in the south side, and there are 58 children to be provided for, *i.e.* 87,000 cubic feet of air should be supplied. If this air passes in through the three windows on the south side, each window must carry a flow 29,000 cubic feet per hour instead of 18,000 as in the case of the dormitories. We require, therefore, for classrooms more effective cross ventilation and a greater window opening than in the case of the dormitories. At the same time, there is need for quite as great or even greater care to protect the children against draughts, for they are more exposed to the cold than when they are under the bedclothes. It is not, therefore, a matter for surprise that when schools are to be ventilated the mechanical method, by which a certain definite volume of warmed air can be delivered where it is wanted, should gradually gain ground as the most effective method of solving a difficult problem. According to Carnelley, a 4-feet Blackman fan at King Street School, Aberdeen, driven by a 3½ horse-power gas-engine, delivers upwards of 1,000,000 cubic feet of air per hour for the ventilation of the school, so that there is no difficulty in providing the necessary air supply on the mechanical system.

As regards temperature, Morin gives 59 deg. Fahr. as the proper temperature for schools. Some latitude may be allowed, but the temperature ought not to fall below 57 deg. Fahr.

In order to maintain the temperature closed stoves, open fires, fires with fresh-air supply, hot-water pipes, steam pipes, steam radiators are used in different school rooms.

Closed stoves cannot be regarded as a permissible form of heating for rooms that require warming and ventilating for a number of persons distributed more or less uniformly over the whole floor space. Their numerical efficiency as warming agents is very high, but they afford very little assistance to the ventilation. Unless the stoves are carefully lined with fire-brick, so that no iron surface becomes red-hot, they injuriously affect the air, and a long iron chimney, which may also get very hot, is liable to "burn" the air and make it injurious. The most serious practical difficulty arises when the warming has to be combined with ventilation for a large number of persons. All the air inlets are cold. The stove distributes most of its heat by conduction, the direct heating is very local and is associated with a rapid upward current of very much heated air all round the stove. The cold incoming air reaches the stove by coming through floor ventilators or by dropping down to the floor and moving along it towards the vertical rising column round the stove. Before it becomes warm it has already performed its ventilating. There is, therefore, no satisfactory distribution of heat and air together. A room heated by closed stoves is, I believe, always close if it is warm.

Open fires are themselves very active ventilators; they are unsuitable for warming and ventilating rooms occupied by a large number of persons because they distribute their heat mainly by radiation, and in a schoolroom it is practically impossible to distribute the desks so that each occupant gets an equal share of the radiation. Generally speaking, some get the advantage of the fire with a cold current of air to their feet by way of ventilation; others get a supply of fresh cold air to their backs, but lack the necessary warmth. The ventilating grates with fresh air supply afford considerable improvement if the supply of warmed air can be successfully distributed over the room. The warmed air naturally rises at once to the ceiling, and there is danger of its passing into extract flues without having been used. In a room warmed by an open fire there is an upward current of air near the grate rising to the ceiling and passing along it. The warmed air from behind the grate should be delivered into this current. The system is very much disturbed when a room is lighted by gas jets unprovided with separate flues, for in that case a reservoir of air vitiated by the gas collects at the ceiling and must find its way out at the top of the room, otherwise the whole air of the room becomes very heavily loaded with impurities due to the gas. To deliver warmed fresh air into this reservoir of heated and vitiated air is simply to waste it. It is from this point of view an advantage to have the amount of air delivered from behind the fires as large as possible and only slightly warmed, and to have it delivered not higher than the top of the grate.

One open fire will provide ventilation for about fourteen children in a classroom under the conditions indicated. A good deal of supplementary ventilation will therefore be required in the way of cross ventilation where a classroom for sixty children has only a single open fire.

Hot-water pipes and steam pipes distribute the heat satisfactorily, and they diffuse the air of the room by the local air circulation which they produce, but as applied to schoolrooms they are open to the objection that of themselves they give rise to so little head for ventilation that it is difficult to get the necessary amount of air through the rooms. The ventilation has, in fact, to be provided for independently. It is not unusual to make provision for the removal of air by openings in the ceiling leading to cowls of some sort above the roof. These cowls are often very efficient in extracting air, so long as there is wind enough to act upon them; but we have to consider the extraction openings in relation to the inlets, and the inlets associated with extraction cowls are the windows or other openings in the side walls. Sometimes those on one side, sometimes those on the other, will be in use, according to the direction of the wind; in the meantime the extraction ventilators are fixed in position, and their openings cannot be transferred from the one side to the other, and they are placed with proper impartiality where they are as useful for the one side as for the other. But the position is not the most effective one for either side, and the distribution of fresh air is not that which gives the greatest advantage, and a room thus provided may still be close although the ventilators are working actively.

(To be continued.)

THE CATALOGUE OF ENGRAVED NATIONAL PORTRAITS.

THE following defence of his catalogue has been put forth by Mr. Julian Marshall:—

The recently-issued report of the Select Committee on the Museums of the Science and Art Department contains certain paragraphs in reference to the Catalogue of Engraved National Portraits at South Kensington, reflecting very seriously on my appointment as compiler of that catalogue and on the way in which the work itself was performed. The paragraphs in question have been largely commented on by the press, and I ask therefore, as a matter of simple justice, to be allowed to show that the charges made by the committee, so far as they affect me personally, are absolutely without foundation. For this purpose I shall not need to travel outside the report itself and the printed evidence on which it is based.

The report states:—"A good deal of evidence has been laid before us about the Catalogue of National Engraved Portraits compiled by a cousin of the secretary of the Department. The compiler was appointed in spite of protests from the Keeper, who said that it would be a sheer waste of public money. The prediction has been verified. The catalogue has no index whatever. It is grossly inaccurate and full of absurdities, so far as the biographical notes, adapted (sometimes almost verbatim) from previous catalogues issued by South Kensington, are concerned."

The meaning which the foregoing words naturally convey, and which has been generally attached to them, is that I was not a fit person to be entrusted with the work, that the then Keeper of the Art Library (Mr. W. H. J. Weale) protested against my appointment, that I was appointed, in the face of such protest, because of my relationship to the secretary of the Department, with the natural result (foreseen by the Keeper), the production, at great expense, of a catalogue which is (alleged to be) worthless. Surely the committee, in thus suggesting that a barefaced job was perpetrated for my benefit, must have overlooked the following facts, which were in evidence before them, namely:—(1) That I had been, on previous occasions, employed in the Department, as an expert in prints,

on the written recommendation of the same Mr. Weale, made by him after previous inquiry at the British Museum as to my competency, and (2) that Mr. Weale's protest had nothing whatever to do with my competency, but related only to the question whether extra assistance from outside was needed at that particular time. The protest in question was addressed to the late Sir Philip Cunliffe Owen, who was at that time Director of the Art Museum, and it was couched in the following terms :—

"Since our conversation as to the employment of Mr. Julian Marshall, I have gone into the matter of prints and drawings, and find that it will be impossible to employ him at present. It would be a sheer waste of public money. Mr. Reid and Bedward are making inventories, which, owing to the frequent absences of both from ill-health, go on very slowly ; and, until these are completed, there is no use whatever in my asking for professional help. Mr. Marshall himself would feel that our material in its present condition ought not to be put before a man of his attainments and position."

Obviously the only point at issue between Sir Philip C. Owen and Mr. Weale was whether the catalogue should be begun at once or whether its preparation should be postponed until the completion of certain inventories then in hand. Sir Philip C. Owen, in the exercise of his discretion, decided that the catalogue should be proceeded with immediately, and he invited me to undertake the work. I had no communication whatever with Sir John Donnelly (the secretary of the Department) on the subject, and he expressly stated to the committee that the appointment was not made at his request or on his suggestion, and, further, that he had no knowledge at the time that Mr. Weale had raised any objection.

These, sir, are the plain facts, accessible to anyone, and I ask whether they lend the slightest colour to the suggestion in the report that my employment was, in any sense, a job.

I turn now to the assertion in the report that the catalogue was a sheer waste of public money. In justification of this opinion the committee pass certain criticisms (with which I will deal presently) on the biographical notes prefixed to the descriptions of the portraits. But the committee wholly ignore the fact that I was engaged as an expert in prints, and that my primary duty was to describe the prints placed in my hands, technically and otherwise, and to give any information about them which might, in my judgment, be useful to a student of portraits or prints. Whether biographical notes are or are not a desirable addition to a descriptive catalogue of this kind is a question upon which opinions may possibly differ. I added such notes because I was requested to do so ; but assuredly they form an altogether secondary and subordinate part of the work for which I was engaged. That the committee should criticise these notes is a proceeding to which I can take no possible objection, but would it not have been fairer if, before branding my entire work as worthless, they had called expert witnesses to testify as to the portion of it which constituted its special and distinctive feature? This they have not done, but have preferred, without any investigation, to include the whole in one sweeping condemnation. It is not for me to appraise the value of the descriptive catalogue, including as it does the recognition and identification of many nameless portraits, definition of "states" never before described, corrections (by the score) of former catalogues, &c. All this goes for nothing, completely ignored by the committee. Not a witness is examined, not a question asked, though in these points lies the chief value of such a catalogue as this. But I have reason to know that some, at any rate, of those who are best qualified to judge wholly dissent from the estimate of it formed by the committee.

My complaint against the committee as regards the evidence taken by them does not, however, end here. It is the fact, though it may seem scarcely credible, that this condemnation even of the biographical notes rests on the evidence of a single witness, Mr. Weale, who, as has been seen, was at first a strenuous opponent of the compilation of the catalogue, and who, being a man of great experience and knowledge, must naturally have felt aggrieved at being overruled by the late director. Of this I was, of course, entirely ignorant and unconscious. I do not for a moment suggest that Mr. Weale stated anything to the committee which he did not honestly believe ; but it is familiar knowledge that the judgment of the most truthful witness is liable to be affected and warped by his prepossessions, and especially so where his own reputation for sagacity is involved. It is strange, therefore, that the committee should have called no other witness to testify with respect to the biographical notes, and all the more strange since I myself, on hearing that Mr. Weale had criticised the catalogue adversely, wrote to the chairman of the committee offering to give evidence in its defence. But what did Mr. Weale in fact say? Simply that the portion of the catalogue examined by him was "very inaccurate." He gave no instances of inaccuracy, and he admitted that his examination was superficial and confined to a very small fraction of the whole work. Yet the committee, without further inquiry, and without waiting to hear what could be said on the other side, pronounced summary sentence of condemnation in terms which go far beyond anything which Mr. Weale had said.

It would seem probable, from a reference in the margin of the report, that the committee relied in some measure on certain criticisms which had appeared in a newspaper. This, if the fact, does not mend the committee's case. They did not call the writer of the criticisms in question, and, consequently, no opportunity was given for testing their value. The only oral testimony before the committee, on the subject of the biographical notes, was, as I have said, that of Mr. Weale.

Let me now deal with the particular criticisms of the committee. Their charge that the biographical notes are "grossly inaccurate and full of absurdities" is a serious one, and, if justifiable, should be capable of ample verification. The committee do not shrink from attempting to verify it. They cite five instances, which we may reasonably suppose are among the most striking which they could find. The first is my statement that Pugin, the architect, "cruised about the channel collecting archæological and natural curiosities." I am at a loss to know on what ground the committee consider this statement as either inaccurate or absurd. It rests on the authority of the late Samuel Redgrave, and will be found in his well-known "Dictionary of Artists of the English School," a standard textbook. I do not believe that its accuracy has ever been questioned. Surely the committee do not mean to suggest that I represented Pugin as fishing up archæological curiosities from the depths of the channel. I gave my readers credit for some modicum of common sense.

The next instance given by the committee relates to the note on Thomas Hobson, whose date is correctly stated in the catalogue, 1544-1630, and who is there said to have died "at the time of the plague." My statement that Hobson died in 1630, at the time of the plague, is regarded by the committee as inaccurate or absurd, or both. Apparently they are unaware that there was a considerable outbreak of the plague in 1630, more than 1,300 persons having died of it in London alone in that year. Hobson's death took place during that outbreak, and the fact is recorded in Granger's "Biographical History of England," a standard authority, whence, or from some other source, it has been adopted in the "Dictionary of National Biography." Where is the sense or value of such criticism as this?

The third instance cited is that in which I have placed the commencement of the friendship of Ballantyne and Sir Walter Scott in 1873. This is obviously a misprint for 1783. I regret that this misprint should have escaped me (among the thousands which I corrected); but as the date of Ballantyne is correctly given in my note, 1772-1833, and as he is there said to have printed Scott's works from 1799 until the author's death, no one using the catalogue could by any possibility be misled by that error.

The fourth instance is that in which I dated the taking of the Cape of Good Hope by Sir David Baird in 1873. This, again, is an obvious misprint. Sir D. Baird is said, a few lines above, to have died in 1829. Those who have done many consecutive hours of unassisted proof-reading will not be severe on an author who fails to correct a few among some thousands of such errors, especially in figures.

The fifth, and last, instance quoted by the committee is that in which Jackson, the pugilist, has eleven lines of biography, while Lord Beaconsfield has only three. As regards Lord Beaconsfield, the choice lay between a note of some considerable length and the briefest possible notice. The details of his career being familiar to every one, I judged it best to make the notice extremely brief; and I think that most people will be of opinion that in this I decided rightly. As for "Gentleman Jackson," possibly I may have erred in according him a little too much space ; but as he was a very remarkable person, much above his station intellectually, of distinguished manners, a friend of Lord Byron, who several times referred to him in his works, and probably altogether unknown to nine-tenths of my readers, I thought that a few particulars not generally accessible might be acceptable.

Such, sir, are the instances on which the committee base their finding that this catalogue is "grossly inaccurate and full of absurdities." They have not brought forward a single inaccuracy beyond two obvious misprints ; and they have not, I venture to say, pointed to a single absurdity. That the catalogue is entirely free from error I should be the last to assert, but the errors hitherto detected are almost all trivial errors of date of absolutely no importance in themselves, and such as could readily be set right by the addition of a page of errata. These errors have in nearly every case arisen from the circumstance that the authorities on which I relied, and which at the time when I wrote were considered to be the best, and were certainly the only authorities at hand, have, as the result of very recent research, been found in some instances to need correction. Some slips there doubtless are, for which I am justly responsible, but I believe that they are neither numerous nor important. I regret them and I plead as my excuse that

in a work running to over 500 pages, and filled from beginning to end with dates and facts, an occasional slip can scarcely by any amount of care or industry be avoided.

One other statement in the report I ought to notice. The committee assert that the biographical notes furnished by me were adapted from previous catalogues issued by the Department. There was no evidence to this effect before the committee, and I imagine that the statement must have been quoted from the newspaper to which I have already alluded. It is untrue, in fact. I was supplied by Mr. Weale's assistants with certain "slips" containing biographical notes relating to a small fraction only (certainly not one-sixth) of the engraved portraits. These notes, I understood, had been carefully compiled by Mr. Sketchley, a former assistant keeper and the compiler of the catalogue of the Dyce and Forster Library; and to some small extent I was able to make use of them, subject, of course, to verification. The bulk of the biographical notes, I should say fully nine-tenths of the whole, were compiled from standard works.

I have now replied to that part of the report which affects myself, and have shown, I hope conclusively, that it does me serious injustice. The wonder is how statements so sweeping, so injurious and so ill-founded can have made their way into the report. The printed proceedings of the committee throw some light on this. The paragraphs of which I complain were not in the original draft report, prepared by the chairman, on which the committee worked. They were added at a thinly-attended meeting on July 26, the very last day on which the committee met for settling the report. They were proposed by a member whose extraordinary zeal in hunting out supposed abuses had been conspicuous throughout the inquiry; and they seem to have been accepted *en bloc* without question.

In fact, looking to the immense amount of work which the committee had to get through at their last meeting, anything in the nature of adequate discussion was impossible. Had time been taken for careful consideration of the paragraphs so proposed, and for comparing them with the evidence actually before the committee, I venture to think that they never would have gained admittance into the report.

GLASGOW ARCHITECTURAL ASSOCIATION

THE usual monthly meeting of this Association was held in the rooms, 187 Pitt Street, on the 3rd inst., the subject for discussion being "Scottish Church Planning."

Mr. Blain, in describing the development of the Presbyterian church, traced the alteration in plan which the introduction of choir and organ had entailed. He pointed out that the service of the church had of late years undergone great modification. Nowadays the service might be considered in many cases suited more to the emotional than to the intellectual side of our nature. To plan a church for such a service the chancel might be more fully developed, its sacred character could be heightened by a careful disposition of the light, by proper placing of the choir and by the use of sacred symbols and emblems. A feature should be made of the communion table rather than of the pulpit. Features might be made of pews, galleries, font, &c., while broad passages were needed for processional purposes.

Mr. Whitelaw thought it a matter of congratulation that congregations were showing less of the dogmatic spirit which had hitherto prevented the church from being developed on the lines suggested by Mr. Blain.

Mr. Connor and Mr. Craigie maintained that the plan was developing on wrong lines. A church in which the preacher could be both seen and heard by his congregation still appealed to most Presbyterians as suited to their purpose. This, as Mr. Connor showed, did not militate against a church being also architecturally satisfying.

Mr. Hill, in concluding the discussion, pointed out that much that was good of the pre-Reformation times might fittingly be revived in our modern churches.

LANCASHIRE AND CHESHIRE ANTIQUARIAN SOCIETY.

THE opening meeting of the winter session of the Lancashire and Cheshire Antiquarian Society was held on Friday evening at Chetham's Hospital, Manchester. The president, Mr. J. Hulme Nicholson, read a paper in which he urged the enjoyments of pedigree-hunting; the pedigrees not of territorial families, the sources of whose history were so many that it would require a volume to treat of them, but of the undistinguished middle class about whom history was silent, but who might none the less have lived honourable and useful lives and have left, if nothing more, a good name to their descendants. A special reference was made by the President to the excellent work done by the Lancashire Parish Register Society, under the initiative of Colonel Fishwick.

Mr. Samuel Andrew followed with a paper in which he gave extracts from a diary dated from 1758. The diary indicated that strikes were not unknown long before the factory system was in operation. The southern march of the Young Pretender and his "Highlandmen" was shown to be responsible for an impoverished weaving trade, then entirely a domestic industry in Manchester and district.

Some conversation followed the reading of the papers.

Correspondence

Warning to Architects.

SIR,—I have been informed that a gentleman has been visiting architects with a view to collecting subscriptions for a new publication entitled *The Practical Decorator*, which he states is being produced under the auspices of the Architectural Association. I know nothing of the publication referred to, and the statement is false.—Yours faithfully,

T. HOWLEY SIM, Hon. Sec.

The Architectural Association,
56 Great Marlborough Street, London, W.:
October 12, 1898.

GENERAL.

M. Franceschini has discovered the tomb of Ghiberti, the sculptor of the famous gates and other works, in the old cemetery of the church of S. Croce, Florence.

Mr. John Getz will have charge of the department of decorative work in the American section of the Paris exhibition of 1900.

Sir Henry Harben, the chairman of the Hampstead Heath extension scheme, announces that 40,000*l.* has been received or promised towards the 41,000*l.* required to save Golder's Hill as an open space.

A Water-Colour drawing of the late Alfred Pizzey Newton, representing the Arch of Titus, Rome, in 1862, has been presented to the South Kensington Museum. The artist was chiefly known for his Highland subjects, but he also painted some foreign scenes during visits made abroad. It was probably while on one of these journeys that he painted the work which has just become the property of the nation.

"**The Society of Oil Painters**" will for the future be the title of the Institute of Painters in Oil Colours. The exhibition will open on the 27th inst.

The Pathological Laboratories attached to University College, Liverpool, were opened by Lord Lister on Saturday last. They were erected at the expense of Mr. Thompson-Yates, and have cost about 28,000*l.*

An Arbitration Case is being heard in Edinburgh to settle the claim of the Equitable Loan Company against the Corporation for 27,000*l.*, as compensation for value of premises in Milne Square required in connection with the North Bridge improvement.

Dr. L. H. Ormsby, in opening the medical session at the Meath Hospital, Dublin, on Monday, ascribed the progress of surgery as being partly owing to the improved system of building hospitals, and the better system of isolation of patients by pavilion wings and corridor wards, and the construction of new and improved operating theatres, replete with all aseptic instruments and appliances, with sterilising room attached, and walls and floors which are washable, permitting wholesale flushing of the theatre after each operation.

A House in the Rue de Rivoli, Paris, which was used as a dépôt for the archives of landed property, was sold on Saturday last for 1,800,000 francs.

The Admiralty intend to try fans worked by electricity in order to improve the ventilation of the lower decks of warships.

A Bust of Mr. Jacob Bright, by Mr. Onslow Ford, R.A., has been accepted by the Manchester Corporation, and will be placed in the town hall.

A Wesleyan Church House, with a hall to contain three or four thousand people, is likely to be erected in London if the million guineas for evangelisation can be raised.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

SLAG WOOL WORKS, KIRKINTILLOCH, near GLASGOW.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.

Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

DOMESTIC DECORATION.

It is a little curious that, excepting in very rare instances, a new house or a house about to be renovated is always decorated piecemeal. The decorator adorns the ceilings, frieze, dado and walls; the cabinet-maker supplies his special goods; then comes the upholsterer and the ironmonger and other trades. The result of this is only too frequently that incongruity—sometimes very glaring—is apparent in the ornamentation and furnishing of a room or suite, while, in addition to this, unnecessary expense is incurred, to say nothing of the trouble involved in receiving accounts from two or three different tradesmen.

As an effort to abolish this system, or rather lack thereof, Messrs. A. R. Dean, Limited, of Corporation Street, Birmingham, undertake to decorate a room, a suite or a house right through. That is to say, they will take a suite of rooms with nothing beyond the bare walls and decorate and furnish it completely.

That Messrs. Dean are in a position to do this was quite clear from a visit which we lately paid to their workshops and showrooms. For here we found several departments in each of which work was being carried on. There was the drawing-office in which designs were being got out, and from there are passed to the moulding, where the fibrous plaster was being manipulated. This plaster and its enrichment constitute one of the firm's specialties, and very successfully they deal with it too.

From this shop we passed to that wherein wood was being sawn and otherwise treated by labour-saving machines of all kinds; then to the joinery-room and subsequently to the upholstery department, while a room wherein some artistic carving was being skilfully executed, and also the polishing department, was not forgotten. In the warehouses and showrooms the firm have a large stock of mantels, registers and decorative metal-work, though mantels and overmantels are, of course, made by the firm themselves.

Thus it became clear to us that the system which Messrs. Dean adopt is not only a good one—though that we always knew—but is, with the resources at their command, quite feasible. The course adopted is this: given the empty room or rooms with bare walls, a complete scheme of decoration and furnishing is formulated. This includes covering, ornamenting and enriching the walls and ceiling; covering the floor by the aid of parqueterie, or carpets, or in other ways; the addition of such fitments as may be deemed suitable; and, finally, the supplying of the furniture, ironmongery, and gas or electric fittings.

The advantages of this system are obvious, for the whole work is one great scheme, everything being *en suite*. And this the more certainly in that furniture or decorations of any kind can be made in the firm's own workshops by the firm's own workmen, and under the direct supervision of the author of the scheme.

In the showrooms of Messrs. Dean is a suite which had been treated in this way, and very admirable it was. The general scheme was in each room appropriate, while in the apartments in which ornamentation was artistically permissible the treatment, though free, was in excellent taste. Thus the existence of a capable staff of designers and artists became apparent, and these, added to the resources which one had previously seen, satisfied us that Messrs. A. R. Dean, Limited, are in every way capable of carrying out the complete scheme of which we have spoken.

It only remains to be said that though Messrs. Dean can and do supply their own designs, yet the schemes of architects themselves can be carried out when such a course may be desired.

TRADE NOTES.

The new laundry, Kirkstall Road, Leeds, is being ventilated by means of Shorland's patent exhaust roof ventilators.

Messrs. J. & E. Goad, of Phœnix Steam Marble Works, Plymouth, are proprietors of extensive marble quarries in different parts of Devonshire, from which they obtain marbles of remarkable beauty, alike as to colour and "figure." They are suitable for columns and pilasters, whether ornamental or purely constructional, and for panelling and other forms of decoration they are unsurpassed. They have been largely employed with excellent effect at the Brompton Oratory, the Leeds and Birmingham Municipal Buildings, numerous churches throughout the country, and are being exported to the Continent and the colonies.

A new Roman Catholic church was dedicated on Sunday last at Ballynafeigh, Ireland. It has been erected at a cost of 8,000*l*.

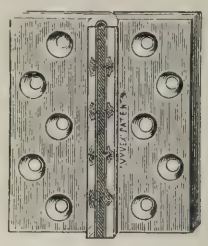
THE NEW POST OFFICE, AMSTERDAM.

NEW CATALOGUES.



We have received from the "Climax" Ventilating and Heating Company, of Hope Street, Glasgow, an up-to-date illustrated price list relating to their "Climax" ventilators, of which they manufacture a variety suited to all purposes and positions. Their designs for louvre and turret ventilators are of excellent architectural effect. The Cousland "Improved Climax" direct-acting invisible roof ventilator is a special improvement upon the former "Climax" patent (now lapsed), giving a more powerful extracting force and larger area of outlet than has hitherto been obtained. It has by exhaustive tests been proved equal in extracting powers to any turret ventilator on ridge of roof from whatever direction the wind currents may blow. In a dead calm the exit area of the Cousland "Improved Climax" direct-acting invisible roof ventilator is double the area of the pipe. It can thus be depended upon for a continuous outlet; while, being fitted with automatic valves, it is thoroughly free from down-draught. It is a simple and inexpensive form of ventilator, and does not interfere with the architectural features of a building.

Messrs. Adshead & Smellie, of Ivanhoe Works, Dudley, send us a capitally brought out catalogue of their "Ivanhoe" metal-work, comprising, copper, brass and ironovermantels, girandoles, standard lamps, coal vases, gas and electric light fittings (some of the designs for which are exceptionally good and novel), grates, fenders and fire implements, fire screens, standard lamps, &c. The range of designs is a very large one, and it is characterised throughout by grace and refinement.

We have received an advance copy of Mr. W. Duncan Tucker's new catalogue of joinery and mouldings, of which there is a very large variety, including some very excellent designs. The list also includes several suggestions for horticultural buildings, from garden frames to winter gardens.

THE "VYVEX" PATENT HINGE.

Messrs. Tonks, Limited, of Birmingham, have just brought out a novel hinge, which is (as the illustration shows) in outward appearance like other double-washered hinges, but has the very important addition of steel columns—to which the washers are securely attached—cast inside the knuckles.

For this patent the following desiderata are claimed:—The working load is more equally distributed over the whole of the knuckles, which in their turn are strengthened and supported; pins and knuckles will wear true to the last, as sagging is impossible; they have three times the durability of ordinary washered butts, and there is no increase in price over other makes.

ELECTRIC NOTES.

The deputy-mayor (Alderman Dr. Thursfield) presided at the meeting of the Leamington Town Council on Tuesday, when it was unanimously decided to apply to the Board of Trade for an electric-lighting provisional order in the next session of Parliament.

The West Bromwich electric-lighting committee have decided to request the Town Council to empower them to employ an expert to advise them as to the best means of carrying out the lighting order, and to authorise them to obtain any requisite information for that purpose.

The electric light failed throughout the Norwich post office on Friday night last. The letter-sorters were unable to read the addresses on the letters, and postage-stamps were sold and telegrams forwarded with the greatest difficulty. Attempts were made to light the building with a number of small candles,

Chief Offices—Dock House, Billiter Street, E.C. Also at Manchester, Newcastle, Liverpool, Hull, Cardiff, Glasgow, Bristol, &c., &c.

but these only added to the confusion. The electric light also collapsed in the Royal Hotel, opposite the post office.

A special meeting of the electric-lighting committee of the Middlesbrough Corporation was held on the 5th inst. for the purpose of considering plans and specifications of the proposed scheme for the electric lighting of the borough. It was originally intended to lay down plant estimated to cost 25,000*l.*, but a larger scheme was suggested, and it was unanimously thought that this would prove more advantageous to the town. This scheme was adopted, and it was decided to apply to the Local Government Board for sanction to borrow 36,000*l.* to be repaid in thirty years.

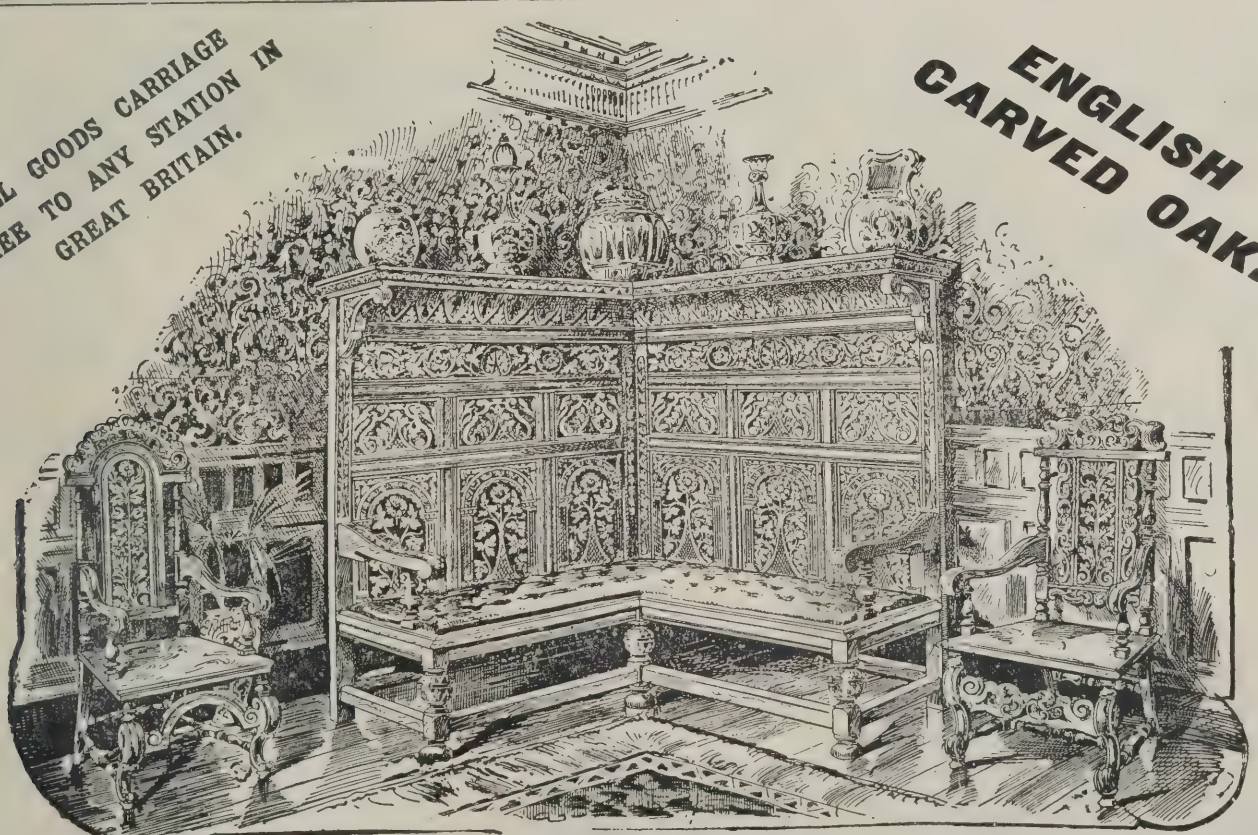
BUILDING AND BUILDERS.

Mr. Peter Jenkins's tender of 17,140*l.* for the construction of two covered reservoirs, &c., at Fairlight, in connection with the distribution of the Brede Valley water, was accepted by the Hastings Town Council at the last meeting.

A plot of land at the entrance of Heysham Road, Morecambe, has been purchased, at a cost of 1,850*l.*, by the trustees of the United Methodist Free Church, Regent Road, who intend to erect there a commodious chapel and Sunday-school.

The Secretary of State for Foreign Affairs has received a despatch from Her Majesty's Consul stating that the municipality of Warsaw have decided to construct market halls at a cost not exceeding 1,092,390 roubles (about 100,000*l.*). Tenders for the construction should be addressed to the president of the town of Warsaw. Details of the buildings, which must be according to plans and estimates already approved by the municipality, can be seen daily in the administrative department of the town hall of that city.

The memorial-stone of the new Welsh church dedicated to St. David, which is in course of erection in Lime Grove, Oxford Street, has been laid. The plans have been prepared by Messrs. Preston & Vaughan, architects, Diocesan Chambers. The style of architecture adopted is Early Perpendicular, and the materials employed are red brick, with Ruabon terra-cotta dressings. The plans include nave and aisles, with chancel and vestries on the south side. Chairs will be provided for the worshippers instead of pews. The church will accommodate some 400 persons. The builder is Mr. R. Carlyle, jun., Ardwick. The work was commenced about three months ago, and it is hoped that the church will be ready for consecration about Easter next.



The Loughborough Town Council have decided to construct some important waterworks at Blackbrook, in order to impound the whole of the drainage of this extensive watershed of the Charnwood Forest and satisfy the present considerable and growing demand of the consumers. The principal structure will be a reservoir to contain 506,000,000 gallons, or 253 days' supply at the rate of 2,000,000 gallons a day. The reservoirs will be formed by a dam across the narrowest part of the gorge of the Blackbrook valley, and will form a lake nearly a mile long and 2¾ miles round. The dam will be 85 feet high and 475 feet long. The estimated cost is 65,000*l.*

At a meeting of the Old Kilpatrick School Board on the 6th inst. a report was submitted by a special committee on the proposed extension of Milton school, the present building having been declared by the Department quite inadequate for teaching purposes. The plans provided for an extension of the school and playgrounds, while inquiries were also suggested as to the price of ground in the vicinity in the event of the Board deciding to build a new school. It was left to the clerk to make inquiries of the architect as to the cost of extensions, as suggested by the committee which inspected the school this week, and to ask Mr. Paton, factor on the Auchentorlie estate, as to the price of ground on the west side of the road leading to the village.

The foundation-stone was laid on the 6th inst., at Nailsworth, of a church which will be dedicated to St. George, and will occupy the site of the church which was erected in 1794. It will accommodate when completed about 700 people, and will consist of nave 84 feet by 27 feet, with north and south aisles, each 12 feet wide; tower, which will form south entrance; north porch, chancel 30 feet by 24 feet, vestries and organ chamber. The tower is designed to accommodate a ring of six bells. The present effort contemplates the erection of the nave and aisles, the first stage of the tower and the north porch. The style adopted is Early English, or First Pointed Gothic—a simple and stately effect being aimed at. The walls will be built of local stone, faced externally with shoddies of weather stone, and will have dressings of Hampton Common and Box Ground Bath stone. The roofs will be steep, and covered with stone tiles. The contract for the present undertaking amounts to 4,820*l.* Mr. M. H. Medland, of Gloucester, is the architect, and Mr. Wm. Wiggall, of Bisley, is the clerk of the works. The total cost of erection of the new church

is estimated at from 9,000*l.* to 10,000*l.*, but as the work is to be undertaken in sections, the first cost is put at about 6,000*l.*

The tender of Mr. H. Ackroyd, of Calverley, for the extension of the Calverley main sewer from the bottom of Capel Street to near the Hall Gates, has been accepted by the District Council.

The trustees and building committee of the Farsley New Liberal Club premises met on Tuesday to examine the tenders, and they let the principal contracts.

VARIETIES.

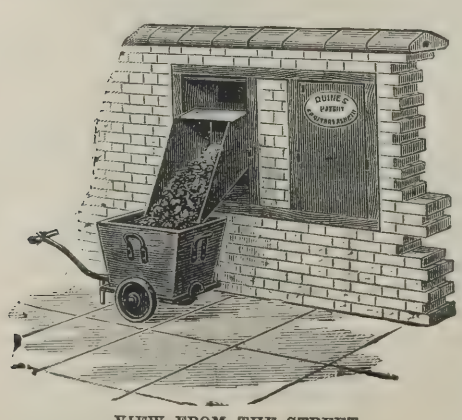
The new dock at Barry, which covers an area of 34 acres and is 3,338 feet long and from 400 to 600 feet wide, has received its first cargo steamer. Extensive provision is being made for incoming and outgoing traffic.

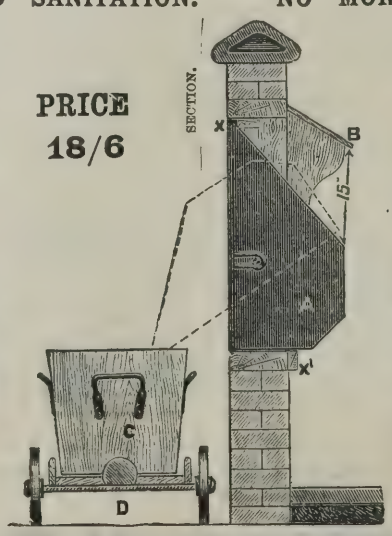
The Bishop of London has consecrated the new parish church of Emmanuel, West End, Hampstead, to meet the wants of the growing population of nearly 10,000 people. The cost of the first portion of the building, including the site, &c., will be 10,000*l.*

It is proposed to establish an Archæological Society for East Herts, and with this view a meeting is to be held on Monday in the council chamber of the Town Hall, Hertford, the Mayor of the town presiding.

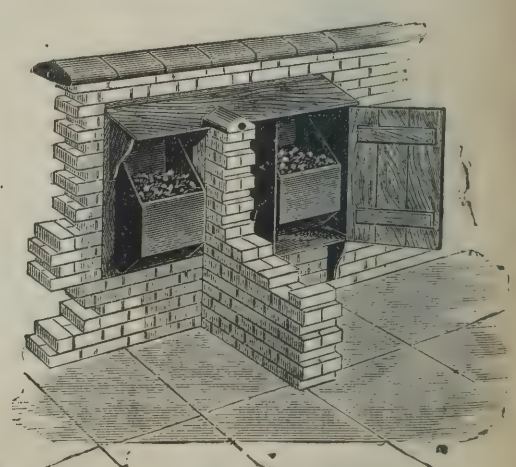
The completion of the dock system at Southampton was celebrated on Wednesday by the formal laying of the coping-stone. The spot selected was at the south-west corner of the Prince of Wales's Quays and close by the graving dock, which is the largest of its kind in the world. The foundation-stone of the first Southampton Dock was laid on October 12, 1838, and was, therefore, the sixtieth anniversary of the event, and it is interesting to know that there were several people present who were at the ceremony six decades ago.

The insurance claims on the Colston Hall, Bristol, recently destroyed by fire, have been settled by the various companies. The directors of the Hall Company, who will receive 15,000*l.*, have officially intimated that they will consider their plans for the future with all possible despatch. The large hall was insured for 21,000*l.*, of which the companies will pay 10,500*l.*, as all the walls are intact. They thus pay 50 per cent. of the insurance. They will further pay for the total loss of the organ, 2,500*l.*, and 2,000*l.* for the total loss of the contents of the hall.





The new church erected at Waverley Road, Small Heath, under the auspices of the Unitarian community, was dedicated on Saturday last. The style of the edifice is simple Gothic, and there is a seating capacity equal to a congregation of 400. The surmounting of the building with a tower and spire, and the erection of schools, are portions of the scheme which for the present are deferred. The structure has involved an outlay of 2,700*l.*, exclusive of the cost of the site. It was designed by Messrs. H. Eachus & J. A. Grew, and the contractor was Mr. B. Whitehouse.



The ancient parish church at Bulmer, whose history reaches far back into the Saxon period, and a portion of which has recently undergone considerable renewal, was reopened on the 6th inst. The south and east walls of the chancel have been rebuilt and a beautiful stained-glass window put in the east end. The window consists of three lights, the central figure representing the Crucifixion, with the walls of Jerusalem in the background and the side lights representing the two Marys at the Master's Cross. A new reredos and altar table has been erected and the choir stalls, &c., are also renewed.

The report and estimate of Messrs. W. Meek & Sons, engineers to the Workington Corporation, show that the building of the new dock on the north side of Workington would cost 350,000*l.*, which is greater than the dock scheme of the south side, which was abandoned. The report shows, however, that a lock and channel could be built for the present Lonsdale Dock at a cost of 220,000*l.*, which would give Workington greater shipping facilities and dock accommodation than Maryport, its seven-miles-distant rival, possesses.

In carrying out the preparatory work in connection with the park which the Earl of Londesborough (lord of the manor) presented to the town of Selby some few months ago, not a few interesting discoveries have from time to time been made. The placing of the main pipes for draining purposes has brought to light some further archæological matters which have occasioned no small amount of conjecture among those who have had them brought under their observation. The most important of these "finds" is that of an old foundation which has been laid bare by the contractor, who expresses a hope that the Urban District Council, in whom the park property is vested, will give instructions for it to remain open permanently. This founda-

tion is believed to be that of what was formerly associated with Selby Abbey in the monastic period as the refectory. From the information that has been gleaned on the subject, the building would appear to have occupied the exact position assigned to it by the vicar of Selby and rural dean (the Rev. A. G. Tweedie, M.A.), who in a recent publication, of which he is the author, exhibits a plan connecting this structure with the abbey in the same vicinity now unearthed.

NEW GREYFRIARS CHURCH, Edinburgh, was reopened for worship on the 9th inst., after having been closed for more than two months for painting and other improvements. Called the New Greyfriars when the building was divided and made into two places of worship in 1722, it still retains, with its massive pillars, arcades and aisles, the principal features of the Greyfriars Church of 1620, which was built on the site of the Franciscan Convent Church about 1430. During the incumbency of the Rev. Dr. Henry Cowan, modern seating was introduced and other improvements made in 1883, and shortly afterwards an organ was placed in the east gallery. For some years past it was becoming evidence that a thorough cleaning and painting of the interior was necessary, and the Rev. Dr. Stewart's appeal to the congregation for funds was so cordially responded to that it has been found possible to carry out also an extensive scheme of decoration as well as to introduce electric lighting. The side windows of the west gable have been filled in with stained-glass in geometric patterns, and a member of the congregation, Mr. John Pillans, has undertaken to fill the great west window also with stained-glass, having Scripture figure subjects in each division. This work is in preparation, but it will be some weeks yet before it is completed. The principal feature of the electric lighting is two large brass coronæ suspended from the ceiling, diffusing a fine light throughout the building. Ceiling lights are placed under the galleries, and the galleries themselves are lighted by standards of brass and iron, with foliated heads.

ANOTHER important piece of work in connection with the restoration of Crowland Abbey has become urgently necessary, owing to the movement of the north wall of the eastern chapel, which will have to be taken down and rebuilt. The work was originally divided into ten sections, and eight of these have now been completed, at a cost of upwards of 3,000*l.* Much, however, still remains to be accomplished. The entire roof of the north aisle must be removed, as the oaken beams are rotten, and some have nearly left the south wall. The porch ceiling, finial, &c., are in need of repair, and these, with the other work referred to, will involve an estimated outlay of 1,000*l.* before the fabric of this historical landmark can be pronounced secure.

THE stones which formed the central portion of the old Netherbow Port of the city of Edinburgh have lately been brought to light through the care of a gentleman much interested in the antiquities of the town. One of these stones is of especial interest, because upon it was placed the head of the famous Marquis of Montrose after his execution. In this case, therefore, the historic associations with old Edinburgh are of the highest value. This portion of the Netherbow Port seems to have been erected for the provost and bailies in 1606 by John Mylne, master mason to the king of Scotland.

THE new King Henry VIII. Grammar School and the County Intermediate School for Girls at Abergavenny were opened last week. The County Intermediate School for Girls is situated on a site in Stanhope Park given by the late Mr. William Jenkins, and has been erected at a cost of about 1,700*l.*, 300*l.* of which were contributed locally by voluntary subscriptions. Accommodation is provided for about seventy scholars, but the buildings were planned in view of future extension. The school was opened in January last with sixty-three scholars, which has been increased to seventy-two. The design is a simple type of Renaissance treatment, and the materials and workmanship throughout are of a substantial and high-class character. Mr. E. A. Johnson, of Abergavenny and Merthyr, was the architect, his design being selected out of fifteen others submitted in open competition. The work was satisfactorily carried out under his supervision by Messrs. Morgan & Evans, Pontypool. The Grammar School occupies a pleasant site conveniently near the town and railway stations. The original school was founded in 1543 by King Henry VIII., who, on the dissolution of the local priory, gave the parish church of St. John's for the school, with an endowment of tithe from other parishes, the priory church (St. Mary's) being given to the parish. The school has been held in the buildings of St. John's till now. The new buildings have been erected at an outlay of about 5,000*l.* The style is Gothic Tudor, having an imposing elevation. The buildings erected will accommodate about 130 scholars, and consist of a large lecture-hall and four class-rooms in connection therewith, one being fitted up as a chemical laboratory. Future extension is provided in the plan for about 100 more scholars and a master's house. Mr. Johnson and Messrs. Morgan & Evans also carried out this work.

THE GOVAN BUILDING DISASTER.

An official investigation, under the Fatal Accidents Inquiry (Scotland) Act, was held on the 6th inst. in the Justiciary Buildings, Jail Square, with regard to the accident at an uncompleted building in Govan Road and Napier Street on the 19th of last month, by which five men lost their lives. It will be remembered that the top floor of the building collapsed, when five men were killed and three persons injured. Sheriff Fyfe presided and Mr. Hart led the evidence for the Crown.

Mr. William Orr, the proprietor of the building, testified that he was a builder and lived at Moss Cottage, Dumbreck. The building in which the accident took place was at the corner of Govan Road, Napier Street, and it consisted of five storeys, including a semi-basement. Part of it was to be used as a lodging-house, and there were also shops on the ground floor. All the floors were of concrete, and wire was embedded in the concrete in a barbed form. On the day of the disaster the third and fourth floors seemed to be in good condition and to have consolidated, and there was no appearance of insecurity about them. These floors had been completed, and the fifth was just being done in the same fashion as the others. He heard of the accident by telephone about half an hour after it occurred, and when he arrived at the scene he found that all the floors had been carried down to the basement, and that five workmen had been buried in the débris.

When you were at the building shortly before the accident, did you observe what material there was on the fifth floor?—There was nothing except the stuff they were using for the floor—soft plaster concrete and a rubble box.

Can you give an opinion as to how the accident took place?—It is not possible to say what the cause of the accident was. It must have been one or other of two things. It is possible that something happened to a temporary timber support. A temporary floor was built, consisting of boards laid upon the top of joists, which were only temporarily fastened, because the wet concrete kept them in position. The concrete was laid upon the platform, which was removed when the material hardened. At the time of the accident the concrete was being put on the arrangement of boards and joists. They were bound to believe that something gave way, but what it actually was there was no evidence of a conclusive nature to show. Either part of the timber which acted as a temporary support to the concrete gave way or the concrete floor below, on which the runners and verticals were supported on one side, gave way.

By Mr. Newlands: At the time of the accident the boards had been removed from the floor below and the fifth floor was being filled in, like the others, in sections.

Was the putting in of this concrete under a separate contract?—It was done by myself, under the supervision of my own foreman. There was a master of works at the building; he was Mr. Kerr. The building was nearly completed, and as Mr. Kerr thought his services were no longer necessary, he began to discontinue his visits about a week before the occurrence.

By Mr. Shaw: He was interested in concrete as a special material for building, and he had used it to some considerable extent.

You are not a skilled builder or joiner?—No.

Do you maintain that the full responsibility for the building rests upon the architect?—The usual responsibility.

What do you mean by that?—I cannot define it.

Did you accept any responsibility in the way of giving orders in regard to the erection itself?—I did not accept responsibility unless in consultation with my men. I was responsible as regarded the mason and joiner-work, but not being a practical man that was in the hands of Andrew Davidson and John Simpson. They had enough experience and training to see that the work was being carried out in a proper and tradesmanlike manner. The section which was being concreted on the fifth floor was 32 feet by 11 feet, and the thickness of the concrete was 6 inches. The weight, he estimated, of the concrete in a wet condition would be something like 8 tons. There were four sections of the same dimensions on the floor and only one collapsed. They were erected separately. He could not say how many vertical supports there were to support the runner, there might be six or seven or eight. He did not know of any other person who used barbed wire. He claimed it as a novelty of his own, and his idea was that the resistance was very materially increased by its presence. Barbed wire was thoroughly desirable in a fireproof building. The floor would have been completed on the day of the accident if nothing had occurred. He had not heard of an accident in England shortly before in connection with a building. The wire he used was the ordinary kind such as was used in fields, and it was four-bar thick-set wire netting.

Supposing there had been no wire, what would you have used in place of it?—Light tubes, for example.

Is it not the case that steel girders are used in all concrete work, and that you substituted this wire in place of them?—

N.B.—Please mention this publication. [1]

The common system of doing these floors is to use cross joists, but instead of that I had the arrangement of the netting.

Before doing so were you satisfied that it would be as good and as strong as ordinary supports used in concrete floors?—Yes. I had experience of it in a building at the head of Buchanan Street. Examined further, witness said that as regarded cost he did not think there was much difference between using the wire and a number of small joists. As one floor was completed the wood was taken out and used for the next floor.

By Sheriff Fyfe: For the most part the concrete which was used consisted of broken bricks and other suitable materials and cement. The proportion was three or four bags of cement to a cubic yard of broken bricks. He paid very particular attention to the material, and he was satisfied that it was broken to the requisite size, and that the mixing was properly done. The mixing was a specialty, and Davidson, like all foreman masons, knew how to do it. He had some knowledge of the use of this concrete in combination with steel, although he was not a practical man himself. Davidson knew what the mixture should be, and it was a very simple matter for the masons or labourers to carry it out under his supervision. The concrete was spread on the floor as soon as it was made. The floor below the fifth, and upon which the uprights rested, had been laid about ten weeks previously, and in his opinion it had thoroughly set, but it had not been tested by weights. It was not customary to test by weight the floors of a completed building; they relied upon them being right when the proper materials had been used and sufficient time given for hardening. His opinion was that the fourth floor should have been able to bear twice the weight of the one above it, or about 16 tons.

In the course of further cross-examination, Mr. Orr said that the architect, Mr. Anderson, did not take anything to do with the building beyond drawing up the plans. The two foremen had entire charge.

Mr. Charles P. Hogg, C.E., said that he had examined the building, and so far as he could see the material used was good. He formed the opinion that the accident happened owing to the temporary support of the ceiling of the fourth floor giving way. It either occurred that way or through the collapse of the fourth floor, which had been finished previously. On inquiry he found that the temporary timber supports were resting on the one side on a steel girder which was still intact, and on the other side it was so close up to the wall as to bring very little weight on to the fourth floor. He did not think there was anything unusual in not using steel joists; it depended upon what the floor was to be used for.

Mr. William James Anderson, architect, 95 Bath Street, said he drew up plans for the building, and they passed the Govan Dean of Guild Court. He did not superintend actually the erection of the building, but paid visits to it about once a fortnight. He was at the building about a week before the accident, and at that time the fourth floor was completed with concrete, and seemed to be hard. He did not see the fifth floor completed. When he heard of the accident he went to the scene immediately, and found that all the floors of that section had fallen. His opinion was that the accident was due to the collapse of the wooden centres beneath the fifth floor. There probably were contributing causes, but if the centre collapsed that was sufficient to account for the accident.

By Mr. Shaw: It was clearly shown on the plans which passed the Dean of Guild Court that the floors were to be of concrete. He did not prepare specifications for the work, because Mr. Orr was doing the work himself. In some respects the construction of the building was a novelty in Glasgow, partly because of the width of the spans in each section of the floors and partly because of the fireproof principle in a building to be used for this purpose.

Does it come to this, that the building was left to two working men, who were called foremen?—Well, that is not quite the way I would put it. The plans were drawn up in collaboration with Mr. Orr and approved by the authorities. Mr. Orr was the builder, and it was his judgment that carried through the business. Witness did not prepare plans to show the support that would be necessary for the concrete floors. It was not an architect's duty, but in many circumstances an architect would do it.

Is there anything in your plans to show that the intention either of you or the builder was to complete the building in the way in which it was being done?—Certainly. It did not occur to him that there should be some further support between the spans of 11 feet, because he saw no necessity. Roughly speaking, he calculated that one of these floors would bear a weight of 30 tons, including its own weight. The use of barbed wire was a novelty to him. There were perhaps elements of risk in the construction of the floors with this wire, but if they were properly constructed with proper material and workmanship there should be no ultimate risk. So far as he could remember, he never discussed with Mr. Orr as to the

prudence of using barbed wire netting, but he believed that at the time he said to Mr. Orr that it would be rather a risky thing to use this kind of wire. That was because it was new to him, but he had now the greatest faith in it. He had not changed his mind since the accident. He had seen what the floors in another building could carry.

Is it the case that there was an accident in this building some time before the five men were killed?—There was a small one.

The collapse of a roof?—Of a floor, and one or two were slightly hurt.

By Sheriff Fyfe: He merely acted as architect to the extent of drawing the plans; the building was erected under the direction of Mr. Orr.

Mr. John Stewart, builder, who, along with Mr. Alexander Muir, made an examination of the building, gave in a report in which he stated that, in their opinion, the root of the matter had been a weakness in the uppermost floor.

Alexander Muir concurred in the evidence of the last witness.

John Simpson, foreman joiner with Mr. Orr, said he was in charge of the joiner-work done on the building, and Davidson had charge of the mason-work. He gave his impressions of the accident. He heard a crash, and on turning round saw that several floors had collapsed. He assisted in the work of rescue until he was instructed to help to do the shoring.

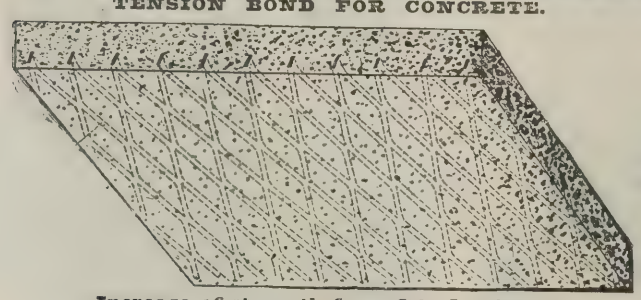
John Rankine, labourer, 21 Crown Street, who was at work in one of the sections, stated that both floors gave way at once.

John Wilson, a member of the Govan Fire Brigade, described the recovery of the bodies of the five men from the débris.

John Kerr deposed that he was a building inspector. He called once a day at the building in question, and asked whether Davidson or Rankine wanted instructions.

By Mr. Shaw: He was not consulted as to the method of laying the supports, and he was of opinion that it was possible the accident was due to the props being taken away too soon.

By Sheriff Fyfe: His duties were principally to carry drawings or instructions to the tradesmen. If he saw anybody doing anything which should not be done he would have spoken about it. Mr. Orr was the responsible man in the first instance in the erection of the building, and those who were also responsible were Davidson and Rankine.



This was all the evidence.

The jury, after retiring for about half an hour, found that the five men met their death owing to the collapse of the flooring of the building, and that this was caused by deficient construction of the concrete and insufficient steel beams. They were of opinion that there was no properly qualified and responsible person inspecting the work, and regret was expressed that no tests were made of the quality of the concrete taken from the wreck.

A correspondent of the *Glasgow Herald*, from which the report is taken, writes:—The verdict of the jury at the inquiry into the lamentable building accident at Govan seems to be that the accident resulted through the failure of the floor supporting the centres, and that the strength of this floor was insufficient because it had not a sufficient number of steel beams crossing the span. Were this to be accepted as an intelligent verdict, the mature result of experience and practical knowledge (which, of course, it was not) concrete construction would be under a cloud. The experience of those who have worked in concrete goes to show that a floor divided by steel beams is less homogeneous than one which is not so divided, and which becomes (first-class materials and workmanship being assumed) a floor possessing all the qualities of a slab of solid rock. Some exception seemed to have been taken to the way in which the work was carried on, as if it would have been better to have kept in all the centres till the last, and then to have removed them together, but it needs little knowledge to see that in this way the considerable weight of all the concrete floors is thrown right from the centres on to the walls at once, giving the walls a sudden strain to meet. Hence the method by which the concrete floors are put in with the building is better as throwing a gradual stress on the walls, and allows also of better lying into them.

As regards the successful use of concrete there is a very large mass of data, almost from prehistoric times. Its modern use is more a revival than a discovery. It is the distinguishing feature of late Roman architecture, all the decorative part of which was applique to the concrete core. The Pantheon dome, about 140 feet diameter, with its famous "eye" or aperture, 27 feet diameter in the centre, is of concrete, and of course without any assistance from iron. There are also the vaults and floors of such buildings as the Baths of Caracalla and Diocletian, and many others which could be mentioned. There is an enormous wall veil at Rome suspended from one of these vaulted concrete ceilings, and originally supported by two marble columns. The columns have been removed for the

sake of their material, but the wall remains, being part and parcel of the side walls and the vault itself, and to all intents as if cut out of the living rock. There is also a concrete floor at Rome of the days of the emperors, about 30 feet by 30 feet by 14 inches thick, in one slab without any iron. This remains to this day. The cementitious materials were much inferior to those which can now be got, such as Portland cement. An Edinburgh constructor advertises warehouse floors of 14 feet span and 32 feet long which are 3 inches thick in the middle, and in which there is no iron; also slabs 3 inches thick, of the same size, stiffened only by two thin concrete projections in the middle. A North of England contractor of floors has built them on similar principles to those followed at Govan, and of the same thickness of 7 inches, in spaces 34 feet long by 18 feet wide, without any cross-beams, and only stiffening rods scientifically placed in the lower side of the concrete; also slabs of at least 12 feet by 8 feet, without any iron whatever, and 4 inches thick. The risks of this construction, as of all fireproof construction, are, of course, greater than with wood floors. In attempting to render a building fireproof, and so to avoid the disasters to which a fire may give rise in such a building, new dangers are created. But every advance in construction, in machinery, or science brings with it certain pitfalls. The lesson of this disaster seems to be chiefly one of attention to the temporary centreing or supporting, for had the under floors been supported they might have taken the temporary strain thrown on them by the collapse of the roof. Good concrete takes a considerable time to harden, and is always hardening. Its full maturity is only attained after years, although the first few days are all important. The proprietor and builder of the Govan building should at least have the credit of attempting to erect at a much increased outlay to himself a thoroughly fireproof and solid structure, whatever laxity or want of care may have taken place in its execution.

PROTECTIVE METALLIC COATINGS.

(Concluded from last week.)

HAVING briefly pointed out the importance of galvanising and explained the nature of the results obtained, the author will now endeavour to give some idea of the process itself, more especially of electro-zincing, and a description of the plant employed.

The first care in electro-zincing is to have a properly prepared surface; all traces of grease and rust must be removed. Machined work, which is usually very greasy, should be immersed for about half an hour before pickling in a hot solution of caustic soda, about ½ lb. to the gallon of water. The work should then be placed in a hot pickle containing about 1 per cent. of commercial sulphuric acid. The author has found that a considerable saving of acid can be effected by placing a false bottom in the pickling tank so as to catch the heavier portion of scale as detached, the tray being removed after the day's work and the scale collected. About 50 tons of acid are required for every 1,000 tons of sheets such as are used for roofing purposes. The articles to be cleaned are made alternately cathode and anode in the bath, the pickling solution being heated by means of lead steam pipes. A tray adapted to normally float on the liquid is fitted in the bath and provided with a perforated bottom and extensions marked, by which it may be depressed and raised. The scale as it falls from the articles under treatment is caught on the tray, and can be removed from time to time. The same object can be attained by placing an electro-magnet behind a lead plate, the pickling solution being caused to circulate over the plate so that the scale may be attracted to the poles of the magnet and removed from time to time. After pickling, the work should be allowed to stand as long as possible in a bath of lime-water.

The Admiralty specify that all steel steam pipes, boiler and collector tubes, and all plates for boilers are to be pickled in a liquid consisting of nineteen parts of water and one of hydrochloric acid, until the black oxide or scale formed during the manufacture is completely removed. Plates should be placed in the bath on edge, and not laid flat. When taken out of this dilute acid all the surfaces are to be well brushed and washed to clean off the loose scale. They should then be placed in a bath filled and kept well supplied with fresh water, or be thoroughly washed with a hose as may be found necessary and then placed on end to dry.

The effect of pickling and rusting on the strength of iron and steel has been shown by Herr A. Ledebur, of Berlin. Rails, joists and bars were subjected to various conditions:—(1) in the condition as delivered; (2) after exposure for purposes of rusting; (3) zinc (galvanised) and tested at once; (4) galvanised and exposed for a time; (5) pickled in acid and immediately tested; (6) pickled and kept for a time in a dry place. The pickling was done in sulphuric acid diluted with water in the proportion of 1 to 100. The samples were tested for transverse, tensile and compressive strains, and under a

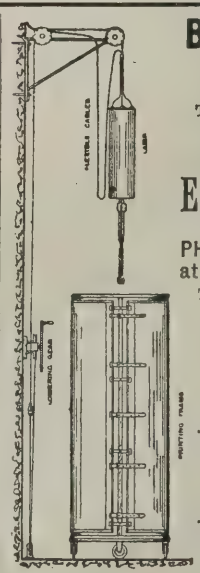
falling weight, these experiments being made on the same sample for each of the six conditions. The bending tests with wrought-iron joists showed substantially the same for all the conditions; the maximum loads carried showed differences, being highest in the natural condition and lowest when freshly pickled. Rusting also produces a diminution of strength more apparent in the galvanised articles than in those not galvanised. In those instances where the specimens were broken, the diminution in strength is said to be very decided in the pickled, and perceptible in the rusted specimens. The figures are :— Breaking strain under condition 1, 35 tons ; under condition 2, 33·9 tons ; under condition 4, 32·7 tons ; under condition 5, 29·6 tons ; under condition 6, 30 tons. The steel specimens showed results which follow the same law.

Mr. W. Thompson, in a paper read before the Manchester Association of Engineers, states that "When iron is placed in acid some of it is dissolved and hydrogen liberated. The gas is supposed to be of the nature of a metal, and as such it combines with and forms an alloy with the iron, which becomes quite brittle until the iron is heated and the hydrogen liberated, when it regains its tenacity. If a piece of wire be broken when it has thus become alloyed with hydrogen, and the end wetted, the bubbles of gas may be seen passing rapidly through the water." This condition of things was observed and investigated by Mr. W. Johnson, B.Sc., of Manchester, and afterwards by Professor Osborne Reynolds, F.R.S. The latter showed that if an iron tube be closed at one end and filled with oil and placed in an acid solution, hydrogen is liberated from the outside, which passes through the wall of the tube, displacing the oil, so that the gas may be thus easily collected from the inside of the tube. There is a possibility, therefore, that when iron is rusting, the hydrogen liberated may similarly combine with the iron and render it brittle or reduce its strength, and this is a question of much importance to engineers.



Some interesting experiments in regard to the decrease in the strength of iron after being pickled and galvanised have recently been reported. A dozen eye-bolts, all precisely alike as far as could be perceived by external inspection, were carefully selected. Six of these eye-bolts were laid on one side, and the other six sent away to be galvanised. A testing machine was at hand, but six bolts were connected together, one galvanised bolt being connected to each of the ungalvanised ones. Then they were placed between two pieces of iron and the nuts screwed up until the eye-bolts broke. Invariably it was found that the galvanised eye-bolts were the ones to break ; not in any instance did the ungalvanised ones give way. Boat builders also state that galvanised iron is "rotten." They say that when great strength is required, they select the iron and have the fittings forged by a good smith, but do not have them galvanised. Galvanised iron is frequently used in places where little strength is required, but where rust would be objectionable. For this purpose, galvanised iron leaves nothing to be desired, but where the full strength of the material is required and rust stains are objectionable, the object may be obtained by cleaning them by the sand blast process, and afterwards coating them by the cold galvanising process ; both of which methods are becoming well known and largely used for the above purposes.

Sand blasting is often used instead of pickling, and for many purposes it is found to give better results, especially for cast-iron work, from which it is very difficult to remove the last traces of acid. The cost of sand blasting per square foot, under the most favourable conditions, including the cost of labour, sand and power, is one-tenth of a penny, but the actual cost varies considerably with the nature of the work. When using quartz sand of the best quality the loss is about 10 per cent. each time it is passed through the machine ; the loss when using chilled iron sand is very small, the waste of the material replacing more than nine-tenths of the apparent loss.

In Government shipyards where most of the iron has to be freed from scale, a small addition to the staff is sufficient to enable the same amount of work to be galvanised. Hitherto the great difficulty experienced in electro-depositing zinc has been to keep the electrolyte in working order, as zinc anodes, whether cast, rolled, amalgamated or in the form of granulated zinc, fail to keep the solution up to its normal strength. The addition of zinc oxide has been suggested, but the cost is found to be too great, and at present a pure oxide cannot be attained at a reasonable price. The author has found the addition of zinc dust to the electrolyte to be the only practical method of accomplishing this end. The zinc dust, which contains about 75·5 per cent. of metallic zinc and usually a trace of cadmium, is

cheaper in the first cost than virgin spelter; the use of it also considerably reduces the waste of zinc, as practically the whole of it is consumed. Zinc dust or tultz is a greyish amorphous substance, and must not be confused with zinc oxide; it is obtained as a sublimal product in the flues of the zinc-smelting furnaces. Small quantities of zinc dust are placed from time to time in the regenerating tanks, which are connected to the depositing vats by a system of piping, the electrolyte flowing into the bottom of the depositing tanks by gravity, the lighter liquid being drawn off over a sill at the end or in the corner of the vat.

It is found very advantageous to mix the zinc dust with sand or coke and thus form a filter-bed; if the zinc dust is allowed to get into the electrolyte it is found to increase the electrical resistance. A zinc sulphate solution containing 12·59 free acid, after passing through a filter-bed containing 10 per cent. zinc dust, was found to contain only 0·68 per cent. free sulphuric acid. To obtain good bright deposits of zinc it is necessary to keep the solution as free as possible from impurities; if the electrolyte is allowed to get too acid the zinc will be dark in colour and rough.

The work to be zinced is secured to dogs fitted to crossbars which rest on copper strips attached to girders carrying the anodes. This arrangement effects a considerable economy in the first cost of the plant. It has also the advantage of allowing the electrodes to be brought much nearer together than would otherwise be the case. In the plant the baths are capable of dealing with plates 6 feet by 5 feet, the tanks having a capacity of 900 gallons. The heavier classes of work are transferred from the vats by an overhead carrier, the lighter by a trolly running on rails.

A special feature of the electrical process is that plates of very large dimensions can be speedily zinced on one or both sides, which is a matter of some importance now that plates of great length are being put in the straight run of steamers' hulls. The frames of such craft as torpedo-boat destroyers can also be galvanised after rivetting up.

The first cost of a galvanising plant having a capacity of 6,700 gallons (30 feet by 6 feet by 3 feet) is about 600*l.*, which is but little more than that of a hot galvanising plant having a bath capacity of only 10 feet by 4 feet by 4 feet 6 inches outside dimensions. Such a hot bath would hold 28 tons of zinc, which, at 15*l.* a ton, amounts to 420*l.* To keep this large quantity of zinc in a molten condition entails a heavy expenditure in fuel, the thickness of the iron bath averaging more than 1 inch. Moreover, the iron baths are a constant source of annoyance and expense, as the iron is dissolved by the zinc, resulting in the ultimate destruction of the tank.

The cost of electro-zincing varies with the nature of the work to be zinced. The following is an estimate of cost of zincing 20 tons of plate in a working week of fifty-two hours, the average thickness of plates being five-sixteenths of an inch, and the thickness of zinc coating 1 oz. per square foot:—

	£	s.	d.
Labour, piecework, at 1*s.* per cwt.	20	0	0
Incidental expenses, 15 per cent. on labour	3	0	0
Yard labour, 10 per cent. on labour	2	0	0
Zinc, 448 lbs. at 17*l.* per ton	3	8	0
Royalty	3	9	8
Electrical energy, at 1*d.* per E.M.F.	2	18	0
Pickling, at 5*s.* per ton	5	0	0
Rent of building, at 2*l.* per week	2	0	0
Interest on capital	2	17	8
Depreciation of plant	3	17	0
	£48	10	4

Cost per ton . 2*l.* 8*s.* 6*d.*

Both pickling and hot galvanising have the disadvantage of reducing the strength of wires, and of distorting and rendering brittle iron and steel of small section. By exposure to the lowest working temperature of the hot galvanising bath (which averages some 1,000 deg. Fahr., the fusing point of zinc being 775 deg. Fahr.), steel wire of high breaking strain has its hardness, and consequently its ultimate tensile strength and elongational efficiency, reduced by as much as from 5 to 10 per cent. by the drawing of the temper and the formation of an iron zinc alloy on the surface of the steel. It is the practice, when coating steel wire, to keep the bath of molten zinc at as low a temperature as possible, and to run the wire through at a high rate of speed. But these combined causes lead to a considerable waste of zinc by reason of the rapid solidification of the metal on a comparatively cold wire, and they also conduce to the ready breaking or cracking off of the covering metal on bending or twisting, owing to the difficulty with which molten zinc of low temperature adheres to the steel except after prolonged contact. In some cases the wire on leaving the bath is wiped between asbestos rubbers, but steel thus treated is found to resist corrosion only for a short period. The process of hot galvanising is necessarily slow, because the time of passing the wire through the bath is fixed by the fact that the temperature of

MAW & CO. *will forward their Pattern Books, or Special Designs, with Estimates for every kind of Wall and Floor Tiling, on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,*

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

the iron must be raised to or approximately to that of the spelter. The speed at which a No. 12 wire generally travels is from 50 to 60 feet per minute. Experiments are now being made with dipping the coils or bundles of wire in a bath of molten zinc and then placing the coil in a centrifugal machine to remove the excess of metal. Many attempts have been made to electro-zinc wire, but until recently it has not been found practicable to produce a wire capable of withstanding more than one immersion in a copper sulphate solution. Most manufacturers have ceased to galvanise the best classes of steel wire (which cost some 35*l.* per ton) on account of the great risk there is of rendering it worthless. This is unfortunate, for corrosion is found to be very marked on the inner strands of wire rope, and the advisability of protecting the steel is unquestionable.

Electro-zincing does not reduce the tensile strength or increase the elastic fatigue of steel wire, even in wires having a tensile strength of 170 tons or more per square inch, such as are used in the manufacture of pianos. The zinc coating put on by the hot process is also uneven, and the increased weight is often a matter of consideration. The thickness of the coating can only be varied within narrow limits, the minimum weight of zinc being about 1½ oz. per square foot, the maximum 3 oz., except when the molten zinc is raised many degrees above the most economical working temperature, and the articles are removed gradually from the bath, so as to give the zinc time to drain off before getting chilled, or in the case of thin sheets and wires which are capable of having some of the zinc being squeezed or wiped off by rollers or other suitable mechanical means to reduce the amount of zinc to about ½ oz. per square foot. A galvanised sheet of about 24 gauge was found to have a coating of zinc amounting to 8 per cent., the weight of zinc per square foot being 1·04 oz. Excess of zinc has, as already observed, been removed from galvanised wire by passing it through asbestos rubbers, but wire thus treated soon rusts, as it is found in practice impossible to regulate the thickness of the zinc, the result being that an iron zinc alloy is formed on the surface of the iron and no true coating of zinc. The weight of metal on galvanised sheets or terne plates is usually ¾ oz. per square foot. Wires can be coated with zinc by electro-deposition to a thickness of 3-1000 of an inch, or an increased diameter of 6-1000 of an inch, capable of withstanding eight one-minute immersions in a saturated solution of copper sulphate. A wire 69-1000 of an inch in diameter, with a total thickness of 3-1000 of an inch of zinc applied by the electro process, will stand repeated bending round a bar 1 inch in diameter without exhibiting any signs of peeling or cracking.

PATENTS.

The Architect.

THE WEEK.

Many of the frequenters of racecourses and other lovers of sport were likely to be surprised when they discovered that the late John Francis Clark, who for nearly forty years officiated as judge at Newmarket, Epsom and elsewhere, was a practising architect. Mr. Clark was born in Norwich in 1816, and in his eighteenth year he came to London to study architecture. After four years he returned to his native city and commenced practice as an architect and surveyor. He quickly found clients and gained an extensive practice. Mr. Clark designed several residences, stables and other works. Stands were a specialty with him, and the majority of those in use at the principal racecourses in the country were erected from his plans. He succeeded his father as judge, and the office was also held by his grandfather. Mr. J. F. Clark was as upright and indifferent to external influences as the historic Judge Gascoigne, and amidst many temptations to the contrary, his life offered some compensation for the loose morality of the Turf. Architects need not be ashamed that John Francis Clark belonged to the profession.

An article by Herr Von Abramson in one of the Austrian journals gives an account of what is required from any man who in Russia professes to be an architect or engineer. In the first place, nobody can assume either title unless he possesses a Government diploma, which latter can be granted only by certain designated technical high schools. This diploma confers also upon the recipient the power to superintend, with full responsibility, construction work anywhere within the limits of the empire, and places him in the tenth rank of the Government service, corresponding to that of lieutenant in the army, this being indicated by a special badge worn upon the right breast. Anyone not possessing such a diploma, who nevertheless may be a skilled practitioner, or may possess a diploma from some foreign institution, may indicate his profession by the title "techniker," and, in order to have the privilege of assuming sole responsible charge of constructive work in the empire, such an individual must pass an examination before a Government board, although this does not permit him to call himself either engineer or architect. If a practical or technical man, educated in some other country and probably fully qualified by attainments, desires to obtain the title "engineer" or "architect," with all that these imply in Russia, he must enter one of the designated State high schools, as a native student would. This not only involves the passing of a five-years' course of study, but also necessitates the brilliant passing of a severe entrance examination, based especially upon a full proficiency in mathematics and in the Russian language.

Buildings ought to be cheaply constructed in Mexico, for in addition to stone there is a curious material available for walling which is known as "tepelate." A correspondent of *Architecture and Building* says that in appearance it bears some resemblance to ordinary concrete, but it is inferior in strength. Tepelate is of a very soft nature, full of pebbles about as large as a pea, held together by a yellowish cement, and is very light in weight. It is cut out of the ground with spades like peat or turf, and in blocks which in general measure 14 inches by 10 inches by 8 inches. The blocks are laid in the wall without any more mortar than is absolutely required, and very frequently without enough. The courses are six or seven blocks in height when a string-course of four or five courses of bricks is laid, and the wall is continued in this manner until the cornice line is reached. The corners and the window jambs are built of brick, and at intervals of about 8 feet are intermediate piers of brick of the full depth of the wall. The object of these string-courses and piers is to give the strength and solidity which tepelate does not possess. The outer joints of the blocks are filled with a cement mortar into which are placed small sharp edged stones. It is difficult to conceive what these are for, as the outside cementing adheres very strongly to the blocks. After the stonework is all done the walls are given a heavy coat of plaster, which, when dry, is of a dirty greyish colour, which is sometimes remedied by an application of a water paint. Owing to its inexpensiveness tepelate is used extensively in buildings and in walls enclosing yards and gardens.

The following is the official statement upon the results of the competition for the California University :—The jury for the international competition for the Phebe Hearst architectural plan for the University of California, composed of Messrs. J. L. Pascal, president, representing France ; Paul Wallot, vice-president, representing Germany ; R. Norman Shaw, representing England ; Walter Cook representing the United States ; J. B. Reinstein, representing the University of California, closed its sessions at Antwerp on October 4. The following is a list of the authors of the plans admitted to participate in the final competition :—Messrs. Barbaud & E. Bauhain, Paris ; E. Bénard, Paris ; Professor F. Bluntschli, Zurich ; D. Despradelles & Stephen Codman, Boston ; R. Dick, Vienna ; J. H. Freedlander, New York ; G. Héraud & W. C. Eickmuller, Paris ; Howard & Cauldwell, New York ; Howells, Stokes & Hornbostel, New York ; Lord, Hewlett & Hull, New York ; Whitney Warren, New York. The vote of the jury upon each of the plans selected was absolutely unanimous ; some of the jury also recommended that four plans, besides those admitted to the final competition, should be purchased for the University of California. The names of the authors of these plans are as follows:—Messrs. Joanny Bernard & Robert, Paris; Charles des Anges, Paris; Ernest Flagg, New York; Fred. Skjold Neckelmann, Stuttgart. The members of the jury, together with the architects invited to participate in the final competition, will go to California, and in June 1899 the jury will there decide the final *concours* and select the plan, which must be approved by the regents of the University of California, and thereupon the buildings will be erected with the utmost rapidity. It is expected that all the buildings will be completed within the next twenty-five years.

Professor Lodge has appealed to the wealthy people of Liverpool for the erection of a physical laboratory in the University College of that city. When he commenced his work eighteen years ago his first practical class for five students was conducted in an upper room with the apparatus mostly on the floor. Subsequently he was able to obtain the rooms discarded by other professors, and if it were cleaner and healthier, he would not object to his laboratory. Every cellar has a function, and every lobby, passage and cranny is devoted to something. But the accommodation is insufficient for the number of students who are disposed to study physics under the Professor. The electro-technical branch is located in the old iron vegetarian restaurant-room of the Liverpool exhibition of 1887, bought at its demolition and presented by him to the college at a time of extreme striction. It was never expected to last so long, but there it stands, and is splendidly useful. The old college building is as permanent as anyone can wish; its walls are 2½ feet thick, and may perhaps long serve for either zoology or botany; but the electro-technical adjunct is not permanent at all, and in places its iron roof is little thicker than paper. What Professor Lodge desires is a laboratory in which a piece of apparatus, arranged for or by a student, can remain in position ready for next time, and not have to be dismantled and replaced by something else, quickly, for the next man; when all the junior students can get through their work together, and not in relays ; when advanced men can each have a room of his own, and carry on his investigations continuously for months or even years ; when the best-designed fittings and appliances make easy a number of researches which now are difficult ; when good apparatus can be erected and properly treated in position, ready for easy employment or demonstration, instead of, as now, having their parts stowed away in cupboards so as to be out of the way of other things except when they are actually wanted for immediate use. Not much generosity has been displayed of late in providing accommodation for technical instruction in Liverpool ; the Professor's appeal will not fall on deaf ears.

ST. ALBANS CATHEDRAL.

ST. ALBANS CATHEDRAL has a right to be placed near Southwell in any description of English cathedrals. Both are ancient buildings designed for another use, which were elevated to the rank of cathedrals a few years ago owing to the increase of population. Over both was a contest which was aroused by the character of the restoration. As a work of architecture Southwell Minster obtained more interest, although the building is one of smaller area. St. Albans has had the advantage of being near London, and it is bigger than any of the cathedrals, but from its vast size and neglected condition it did not appeal in modern times to the popular mind. There was a general indifference to the abbey, one effect of which is seen in Mr. FERGUSSON'S "History of Architecture," where it is only once incidentally mentioned, and then on account of a tomb.

And yet the history of the abbey is of a character that entitles the building to be reverenced. Nearly sixteen hundred years have elapsed since the Roman ALBAN was scourged and beheaded on or near the spot on which the abbey stands. His crime was the affording of shelter to a priest, or, as WORDSWORTH says:—

> Thus was Alban tried,
> England's first martyr, whom no threats could shake;
> Self-offered victim, for his friend he died,
> And for the faith; nor shall his name forsake
> That hill, whose flowery platform seems to rise
> By nature decked for holiest sacrifice.

The persecution of Christians having ended in England, a church was likely to have been erected in commemoration of our Protomartyr. One was still standing there in BEDE'S time, and it is allowable to suppose that fragments of the Romano-British church may still be found among the conglomeration forming the walls of the present building. In the year 790 King OFFA, who was suffering remorse for the murder of ETHELBERT, resolved to erect a new church and an abbey for one hundred monks as an atonement. The buildings were dedicated to St. ALBAN, and were largely endowed in order that hospitality should be rendered to the wayfarers who passed to and from London. The importance of the abbey increased, and in course of time the town near became known as St. Albans instead of Verulam or Watlingceaster.

It was the opinion of Sir GILBERT SCOTT that many of the shafts of the small columns of the triforium of the transepts are survivals of OFFA'S church. Norman capitals and bases were added to bring them into keeping with the style that followed the Anglo-Saxon. In addition to the erection of a church, King OFFA also sought out the body of St. ALBAN, and had constructed a shrine or châsse to contain it. This work was enriched with golden and silver plates, and a sort of diadem bearing the saint's name was made to encircle the skull.

From its position and wealth the abbey was liable to attacks from marauders. It was not long founded when a host of Danes seized the buildings. They carried off the treasures, including the greatest of all—the martyr's remains. In those days relics had a commercial value, for wherever any belonging to a famous saint were found crowds of votaries attended, and consequently they were worth purchasing at a high price. St. ALBAN'S bones were stolen in 930, and found their way to a monastery at Owensee, in Denmark. But ERGWIN, the sacrist at St. Albans, went there in the hope of rescuing them. He offered himself as a postulant and was allowed to join the community. In course of time the treasure was placed in his charge. He contrived to remove the relics and to despatch them to England. As soon as he could escape in safety ERGWIN followed them. It is needless to say he was received with joy at St. Albans. The monks at Owensee were officially informed that they no longer were possessed of the bones of St. ALBAN, and of course declined to admit the loss of what imparted to them a valuable privilege. But the relics were not allowed to remain at rest at St. Albans. The Danes in their periodical visitations would naturally wish to seize objects which were coveted by their countrymen. The relics were concealed within the walls of the church, but as it was feared their whereabouts had become known they were afterwards sent to the monks of Ely, who were supposed to be in favour with the invaders. When the Danes departed the relics were applied for by the monks of St. Albans, but, as was not uncommon, less sanctified bones were foisted on them. A long period of contests and appeals to Rome followed. Eventually the monks of Ely confessed they were in error, and that St. Albans was possessed of the genuine remains of its Protomartyr. It is now supposed by some that the saint's relics are to be found in a church at Cologne. There was reason, therefore, for JOHN MILTON to say that the story of the martyrdom of ALBAN of Verulam was "soil'd, and worse martyr'd with the fabling zeal of some idle fancies, more fond of miracles than apprehensive of truth."

The possession of the relics was enough to give importance to the abbey. Long before the Norman arrival St. Albans was among the institutions which wealthy Saxons were proud to enrich. It was, therefore, inevitable that when ecclesiastical offices were handed over as part of the spoil of the conquest, an influential Norman should be selected to fill the abbot's chair. PAUL OF CAEN, who was appointed in 1077, was not satisfied with the buildings which then existed. Some of his predecessors had collected materials which he resolved to utilise. From his connection with the king's court it was easy to obtain money and to command labour. In the course of eleven years he was enabled to erect one of the finest churches in the country. His relative, Archbishop LANFRANC, had erected a cathedral at Canterbury which was a copy of the abbey church of St. Stephen, Caen. Abbot PAUL wished to surpass the cathedral. His ambition was expressed in the increased dimensions he adopted. Instead of a nave of nine bays as at Canterbury there were thirteen bays at St. Albans. There were two bays in the cathedral choir and five in the St. Albans choir. Each transept of Canterbury contained two bays with one apsidal chapel, while in St. Albans each transept had three bays and two chapels. The cathedral was 290 feet in length, the abbey church 460 feet. The western façade at Canterbury was 90 feet in width, while at St. Albans the façade was over 150 feet.

So large a building could not be erected in so short a time if the ancient Roman materials were not available. According to MATTHEW PARIS, the Abbot PAUL built his church of the stones and tiles of the old city of Verulamium. That statement appears to be only partially true. Roman materials were used by the Norman builders, but as the Normans endeavoured to imitate Roman methods, it is not always easy to determine what is ancient. It can, however, be taken for granted that there is more of Roman work at St. Albans Abbey than in any other Norman building which exists. With such materials smoothness of surface was impossible, and the work which survives has a ruggedness which places the abbey out of relation with Classic buildings and with those of later Mediæval times. But the exterior presented originally a more even surface, for it was covered with plaster. The abbey was the white sepulchre of St. ALBAN.

The parts which remain of Abbot PAUL'S work are supposed to be three entire bays of the nave, six bays on its northern side, one transept, one bay of the choir aisles and the central tower. The style of those parts is extremely severe, and rather expressive of the Roman character.

In the course of a century the style was, however, considered to be old-fashioned, and JOHN DE CELLA, at the end of the twelfth century, resolved on rebuilding the west end towers of the church in the Early English style. He appears to have been one of those sanguine men who were so often found among ecclesiastics. He was indifferent to contingencies, one of them being a lack of money. Apparently he possessed only a hundred marks. That sum was soon expended. Winter came, and the incomplete walls suffered. He was compelled to desist and undertake a more modest work, viz. the improvement of the monastic dwellings. JOHN DE CELLA'S work is believed to consist in three portals. Yet who does not sympathise with him in his failure to realise his dreams? It is easy to advocate prudence and, like MATTHEW PARIS, to give a homily on the duty of following the Gospel advice on the necessity of computing the cost before projecting a building, but the history of the Church is full of examples of men who set about great things in heroic hope with no more certainty of success than inspired JOHN DE CELLA. The late Sir GILBERT SCOTT, who was not adventurous in spirit, in speaking of the incomplete fragments which represent the abbot's dreams, said:—"I doubt whether there exists in

England a work so perfect in art as the half-ruined western portals of St. Albans. I venerate the architect who designed them, who, I believe, was Abbot John de Cella's second architect, Gilbert de Eversholt. His work is contemporary with two others, which are as fine as almost any in existence—the western porch at Ely and the choir of St. Hugh at Lincoln. All of them were the works of the earliest perfected 'Early English' after it had thrown off the square form of the Romanesque capital; and I believe it to be also contemporary with another of the finest English works—the sanctuary of the dependent monastery of Tynemouth, which, however, retains the square capital."

Abbot William of Trumpington succeeded where John de Cella failed. He completed the west front, as well as five bays on the south side and four on the north side of the nave. Sir Gilbert Scott was struck by the remorselessness of William's dealings with the work of his predecessor, such as "columns with bases for eight shafts reduced at the capitals to four; the marble bandings prepared for the larger number, but roughly altered to suit the reduction, while the marble largely used or contemplated by the one is almost wholly omitted by the other."

William of Trumpington's work was so effective, there was no need for any great change until twenty years had passed. Then in 1256 the eastern arm of the cross had to be rebuilt. John of Hertford was abbot, and the works executed were worthy of so matured a period. He did not restrict himself to operations in the church. Remembering the caravanserai character of the original abbey, he erected a guest hall and increased the accommodation for visitors. The large scale on which hospitality was dispensed is suggested by the stables he built for 300 horses. His successors were no less desirous to have new works in the best style attainable. The lady chapel is to be credited to Abbot Hugh de Eversden, who also renewed the substructure of the shrine of the patron saint. The latter work, which was about 9 feet high, was found in fragments. They were put together while Sir Gilbert Scott had charge of the restoration by Mr. Jackson, a mason who exercised the most extraordinary patience and insight in the task. From its character we can infer the beauty of the shrine, which attracted pilgrims from all parts of the country, and for whose reception the church was not too extensive. In 1323 a part of the Norman nave on the south collapsed. Abbot de Eversden began a restoration in the style of his own time, but the work was not completed until twenty years afterwards, during the abbacy of Michael of Mentmore.

A period of two hundred years follows, in which no extensive additions were introduced. The west window, with others in the north aisle, were credited to John of Whethampstead, who also erected a chantry. Another chantry is a memorial of Abbot Ramryge's time. Cardinal Wolsey succeeded Ramryge, but he was not more zealous at St. Albans than in other places where he enjoyed the income of ecclesiastical offices. In 1539 the abbey was surrendered to the king's visitors by Richard Boreman, the last abbot. The revenue was then estimated at 2,500*l.* Sir Richard Lee obtained the abbey from Henry VIII. The inhabitants during the short reign of Edward VI. purchased the church for 400*l.* and a fee farm rent of 10*l.*, which was subsequently redeemed.

From its vast size the conservation of the church was beyond the resources of one parish, and it is no wonder it was so often neglected. A public footpath ran across the church. The lady chapel was employed for a school. Several arches were walled up. Arcading was removed. The windows were left unglazed. Chapels were used as playgrounds. Reparation was somehow always enormously costly, for every accident appeared to resemble the building and to be on a colossal scale. Thus in 1832 a wall fell on the south-west side, and it was then estimated that the injury would cost 15,000*l.* But so large a sum was not obtainable. As we have said, the interest in the building was restricted, and whatever may be thought of Lord Grimthorpe's restoration with its innovations, it must in justice be allowed that if he had not assumed responsibility the abbey would now be an immense ruin, and a discredit to all lovers of antiquity.

MARDEN PARK AND GODSTONE.*

MARDEN Park is in the parish of Godstone—a fact which seems somewhat singular; but the singularity disappears when it is known that the parish is thirteen miles long and not more than one mile in breadth. In 1589 the manors of Marden and Wolkampstead (Godstone) were purchased by George Evelyn, of Wooton, a gentleman who had sixteen sons and was the founder of the various Evelyn families scattered over the county of Surrey.

John Evelyn, the diarist, writes on October 12, 1677:—"With Sir R. Clayton to Marden, an estate he had bought lately of my kinsman, Sir John Evelyn, of Godstone, in Surrey, which from a despicable farmhouse Sir Robert had created into a seat with extraordinary expense. It is in such a solitude among hills as, being not above sixteen miles from London, seems almost incredible, the ways up to it are so winding and intricate. The gardens are large and well walled, and the husbandry part made very convenient and perfectly understood. The barns, the stacks of corn, the stalls for cattle, pigeon-house, &c., of most laudable example. Innumerable are the plantation of trees, especially walnuts. The orangery and gardens are very curious. In the house are large and noble rooms. . . . This place is exceedingly sharp in winter by reason of the serpentining of the hills, and it wants running water; but the solitude much pleased me. All the ground is so full of wild thyme, marjoram and other sweet plants that it cannot be overstocked with bees. I think he had near forty hives of that industrious insect." Evelyn again visited it three years later. On July 13, 1700, he writes:—"I went to Marden Park, which was originally a barren warren, bought by Sir Robert Clayton, who built there a pretty house and made such alterations by planting not only an infinite store of the best fruit, but so changed the natural situation of the hills, valleys and solitary mountains about it, that it rather represented some foreign country which could produce spontaneously pines, fir, cypress, yew, holly and juniper; they were come to their perfect growth, with walks, mazes, &c., amongst them, and were preserved with the utmost care, so that I who had seen it some years before in its naked and barren condition was in admiration of it. The land was bought of Sir John Evelyn, of Godstone, and was thus improved for pleasure and retirement by the vast charge and industry of this opulent citizen." Milton's often quoted lines seem very applicable to the park:—

> And overhead upgrew
> Insuperable height of loftiest shade,
> Cedar and pine, and fir, and branching palm,
> A sylvan scene, and as the ranks ascend,
> Shade above shade, a woody theatre
> Of stateliest view.

Unfortunately for us, the "pretty house" mentioned by Evelyn has been destroyed by fire. The present building, I am told by the occupier, contains nothing that would interest the Society. Such was Marden Park in its grandest days; its natural beauty has not yet been obliterated, but alas! all that depended on art has faded and gone. At the end of the park is an old building, called Marden Castle, commanding extensive and beautiful views over a large extent of the country.

It may be as well at this point to say something of Sir Robert Clayton. In Macaulay's "History" it is stated:—"Sir Robert Clayton, the wealthiest merchant of London, whose palace in the Old Jewry surpassed in splendour the aristocratical mansions of Lincoln's Inn Fields and Covent Garden, whose villa among the Surrey hills was described as a Garden of Eden, whose banquets vied with those of kings, and whose judicious munificence, still attested by numerous public monuments, had obtained for him in the annals of the City a place second only to that of Gresham." He was the Parliamentary member for the City during seven Parliaments, being often elected by acclamation. He was the alderman of the Ward of Cheap for more than thirty years, and was Lord Mayor in 1679, the year in which the City was so much excited by the Popish Plot. Evelyn says that he had been apprenticed to a scrivener, and having afterwards succeeded to the business made a very large fortune. His reputation stood high not only as a citizen, but also as a patriot and a statesman. He was the mover in Parliament of the Exclusion Bill—the Bill intended to prevent the Duke of York (afterwards James II.) from ascending the throne. He was also a great benefactor to Christ's Hospital and St. Thomas's Hospital. In 1701 the Governors of St. Thomas's Hospital erected a statue of him in his Lord Mayor's robes. When the new hospital was built on the Embankment the statue was removed, and can now be seen in the quadrangle near the Medical School; a copy of it with the same inscription stands on the slope facing the house in Marden Park. The inscription is in Latin and in English:—

"To Sir Robert Clayton, Knt., born in Northamptonshire, citizen and Lord Mayor of London, President of this Hospital,

* A paper by Mr. W. H. Bolt, read at the visit of members of the Upper Norwood Athenæum.

and Vice-President of the new Workhouse, and a beneficial benefactor to it; a just magistrate and brave Defender of the Liberty and Religion of his country; who (besides many other instances of his charity to the poor) built a Girls' Ward at Christ's Hospital; gave first towards the rebuilding of this house 600*l.*, and left by his will 2,300*l.* to the poor of it. This statue was erected in his lifetime by the Governors, Anno Domini MDCCI. as a monument of their esteem of so much worth; and to preserve his memory after his death was by hem beautified Anno Domini MDCCXIV."

During his lifetime he erected his own memorial monument in the church of Bletchingley, about 1½ miles from Godstone. He there appears under a canopy in his Lord Mayor's robes and his wife beside him, on either side of them cherubs shedding tears. An inscription (but not by himself) says:—

"By the justest methods and skill in business he acquired an ample fortune and more than once ventured it all for his country. He fixed the seat of his family at Marden, where he hath left a remarkable instance of the politeness of his genius, and how far nature may be improved by art. His relations, his friends, the hospital of St. Thomas in Southwark (of which he was President), Christ Church Hospital, and the Workhouse in London were large sharers of his bounty. He lived in the communion of the Church of England, and in the most perfect charity with all good men, however divided amongst themselves in opinions. The welfare of his country was the only aim of his public actions, and in all the various efforts that were made in his time for preserving its constitution, he bore a great share, and acted therein with a constancy of mind which no prospect of danger could ever shake. It is but just that the memory of so good and great a man should be transmitted to after ages, since in all the private and public transactions of his life he has left so bright a pattern to imitate, but hardly to be outdone."

These tributes to his memory are very great, but his popularity brought him also many detractors. Let us for a moment look at the other side of the picture, and see what the celebrated satirist of the time says of him:—

'Mongst these extorting Ishban first appears,
Pursued by a meagre troop of bankrupt heirs,
Blest times, when Ishban, he whose occupation
So long has been to cheat, reforms the nation.
Ishban, of conscience suited to his trade,
As good a saint as usurer ever made.
Yet Mammon has not so engrost him quite,
But Belial lays as large a claim of spite;
Who for those pardons from his prince he draws,
Returns reproaches, and cries up the cause.
That year in which the city he did sway,
He left rebellion in a hopeful way;
Yet his ambition once was found so bold,
To offer talents of extorted gold;
Could David's wants have been so brib'd, to shame
And scandalise our peerage with his name;
For which, his dear sedition he'd forswear,
And ev'n turn loyal to be made a peer.

The origin of the name Godstone is altogether veiled in obscurity; no one seems to give a satisfactory explanation to it. Our old friend, Domesday Book, will not help us, for there it is called Wachelstede, and in another old book Wolcnestede, and later still Wolkampstead. Some authorities suppose that at one time there might have been a cross or stone which was much venerated. Others think that the proper name is Gatesdean, that is a pass through a hill or cliff. Whatever may have given rise to its present name, there is no doubt that the village is certainly very picturesque, and on all sides of it there are many charming walks.

The church has undergone a thorough restoration under the direction of Sir Gilbert Scott. Doorways on the west and south sides of a Norman character have been inserted; that on the west side preserves one stone of the original. The church is principally noted for the costly and beautifully executed monument of Sir John Evelyn and his wife. Sir John is represented in armour, while his wife, Dame Thomasine, has a loose robe. Against their feet are the crests of their families, his a griffin, hers a bird with its wings displayed. Sir John erected this monument in his lifetime, and the date of his death has not been inserted. The diary of date October 14, 1677, says:—"I went to church at Godstone and to see old Sir John Evelyn's dormitory joining to the church, paved with marble, where he and his lady lie on a very stately monument at length, he in armour of white marble. The inscription is only an account of his particular branch of the family in black marble." This Sir John Evelyn outlived his family and settled his estate on his mistress, Mary Gittings, who sold it to Sir R. Clayton. There is another fine monument, the recumbent effigy of Mrs. Macleay, in the mortuary chapel beneath the tower of the church. The almshouses beside the church were also built under the direction of Sir G. Scott, at the cost of Mrs. Hunt, in memory of her daughter.

The inn claims to be of very old date. The author of "Coaching Days and Coaching Ways" says "it is stated that the inn was established in the reign of Richard II. and was called the White Hart. Certain portions of the inn were added in Elizabeth's time. In the absence of documentary evidence it requires but a small stretch of the imagination to picture the long crowd of all ranks, kings, queens, soldiers, statesmen, conspirators, coachmen and highwaymen who must have passed the portals of so venerable a place of entertainment as this in the lapse of six centuries. . . . It is stated that in 1815 the Regent, the Czar of Russia and many royal visitors stayed at the inn on their way to Blindley Heath to be present at the fight for the championship of England." In conclusion, let us hope that the meeting of the Upper Norwood Athenæum in this inn will not be of less importance in its future history than that of the many crowned and uncrowned heads that have preceded us here.

THE FRASER BEQUESTS.

THE late Sir William Fraser has bequeathed his collection of costumes, in a volume bound in green morocco, to the Princess of Wales during her life, and after her death to the successive Princesses of Wales; but an assurance is to be obtained that his coat of arms shall not be removed from the book. He bequeathed his collection of Gilliray's caricatures, in eleven folio volumes in red morocco, to the Lord Chancellor and the Chairman of Committees of the House of Lords, in trust, to place the same in the library of the House of Lords for the use of the peers. Sir William Fraser bequeathed his collection of "H.B.'s" political caricatures to the Speaker and the Chairman of Committees for the time being of the House of Commons, upon trust, to place the same in the library of the House of Commons for the use of the members. He bequeathed to them also his collection, which he believed to be unique, of portraits of Speakers, and these are to be framed and glazed in a style which he specified, with an inscription painted in black letters on each frame inside the glass. The testator bequeathed Thackeray's chair to the Travellers' Club, Dickens's chair to the Athenæum Club, Nelson's sword to the Senior United Service Club—on condition that it be placed under Nelson's portrait, and Lord Byron's sofa to the Garrick Club, together with C. B. Smith's letters and the autographs of dramatic persons and Lacy's acting plans. He bequeathed the manuscript of Gray's "Elegy," given by the poet to his biographer Mason, to be placed in the boys' library at Eton or in the museum, if established, and it was Sir William's express direction that no facsimile shall, in any circumstances, be permitted to be made of the manuscript. He left the sword of the first Duke of Marlborough, bearing the inscription, "Presented by her most sacred Majesty the Queen, 1702," and a portrait of the duke in armour, wearing the sword, to the three colonels-in-chief for the time being of the three regiments of Scots Guards, to be placed in the officers' principal guard-room at St. James's Palace; and he bequeathed Holland's "Caricatures," in twelve volumes, for the use of the officers of the Queen's infantry guard in London, but these books are in no circumstances to be lent or removed. Sir William bequeathed the manuscript of Sir Walter Scott's "Marmion" to the Advocates' Library in Edinburgh, and his large folio edition of "The Words of Wellington" to the Senior United Service Club. He bequeathed 1,100*l.* to be applied, as to 200*l.* in printing, illustrating and publishing (including advertising) not less than seventy-five copies, in the best manner as to printing, paper and binding, of which twenty-five copies at least shall be in leather, in one volume, of his work, "Coila's Whispers," of which a specimen copy is deposited at the Bank of England, and including the expenses of the illustrations by Gustave Doré, George Cruikshank, the Marchioness of Waterford and W. M. Thackeray, and for their trouble the trustees are to receive 100*l.*; and they are to invest the residue of the fund in order to publish further editions, the profits from which, if any, are to be given to the Royal Literary Fund.

THE CATALOGUE OF PORTRAITS AT SOUTH KENSINGTON.

IN reply to the statement of Mr. Marshall, of which we published a copy last week, Lord Balcarres, a member of the committee, writes to the *Times*:—

Mr. Marshall only quotes one paragraph of the report made by the select committee. I think it would make the matter more clear if I supply the remainder:—

". . . It is difficult to believe that the compiler was paid two guineas a day for correcting his proofs. In some cases the 'national' prints represent personages of whom no particulars can be given, simply because they were not of national moment. Mr. West, for instance, wax-chandler and oilman of Soho. Such prints are useless to an art library, and there is no need to spend large sums in describing them. The catalogue of the National Portrait Gallery, accurate, indexed and scholarly, costs

6*d.* unbound. Nothing was paid for its compilation, the work being done by the keeper and his staff. But this catalogue, bound in cheap cloth, though not more bulky than the other, has 5*s.* 3*d.* as the price on its title-page. This is erased at South Kensington, where a stamp is affixed worded 'Reduced to 3*s.* 6*d.*,' or 'Price at the museum 3*s.* 6*d.*' The publishers sell the book for 5*s.* 3*d.*, or 3*s.* 11¼*d.* These various prices are somewhat confusing.

"It is not possible to say how much each slip in the catalogue cost. Compilation of titles for descriptive catalogues should cost from 1*d.* to 6*d.* per title, according to the character of the work (Evid. I. 1,340). Miss Ffoulkes, an expert employed to make descriptive catalogues, was paid up to 4*d.* a slip. The slips in this catalogue of portraits must have cost considerably more. For cataloguing 1,071 foreign portraits 174*l.* was paid—about 3*s.* 2*d.* each—an abnormally high price even if these slips are more accurate than those in the published volume.

"As to the price of compilation, &c., it was officially stated in Parliament that the cost was about 499*l.* (June 25, 1896). This answer was not made without very careful inquiry (Evid. I. 7,457). Mr. Weale, who had to certify the attendances of the compiler, said that the catalogue cost upwards of 880*l.* Further inquiries were then made at the request of the committee. It then transpired that the original statement made by the Department was entirely wrong; but attention having been drawn to the mistake, it was still impossible to state the exact cost, which is alleged to be either 619*l.* or 675*l.* We observe that Mr. Weale, nevertheless, contended that the cost was 880*l.* But it is immaterial which estimate is accepted. In any case the cost was quite excessive, and the laxity in the financial department is reprehensible" (p. xxv).

In another part of the report the committee point out that the sum spent upon this catalogue "would have secured the services of an extra assistant museum keeper for five or six years, and he would have done this particular catalogue in eighteen months at the most" (p. xviii). This presents the controversy in all its aspects; but may I make one or two further comments?

1. Mr. Marshall is under a misapprehension in arguing that the committee did not give due consideration to the passages about the catalogue. The draft report which contained the censure had been before the committee a month before it was discussed, and then the committee made certain amendments (p. ci); and then Parliament did not rise until a fortnight later. Moreover, the catalogue had been in the library of the House for a year, and conveniently close to the "Dictionary of National Biography."

2. Mr. Marshall suggests that the errors in his catalogue are few and far between. I can only say that in my own copy I have noted several hundreds more. Whether the technical descriptions of the prints are accurate I offer no opinion of my own, but I imagine that not fewer misprints and errors have been made in this section than in the simple work of compiling biographical notices.

3. It must not be supposed that the criticism of the committee is personally directed against Mr. Marshall; it was against the whole system responsible for this and similar productions that members of the select committee thought it their duty to protest.

Mr. W. H. James Weale writes:—

The letter from Mr. Julian Marshall relating to the report of the committee on the museums under the Department of Science and Art in your issue of to-day contains certain statements as to myself to which I trust you will allow me reply by the insertion of the following statement, which, had I been again called before the committee, I should have handed in. It would perhaps have been better if I had done so at first, but I wished as far as possible to avoid personalities.

Previously to my appointment as Keeper of the Art Library, Mr. Marshall had been employed to compile a catalogue of the prints of ornament then in the library. In February 1892 Sir Philip Cunliffe Owen asked me to recommend his employment on a supplement to this. I looked through the catalogue, and did not form a very high opinion of it, but as some years had elapsed since it had been written, and as, on inquiry at the British Museum, I learned that he had devoted a good deal of time to the study of that class of prints, I recommended his being employed to draw up a supplement, and asked that he should be authorised to devote thirty days to the work.

In December 1892 Sir P. Owen asked me on several occasions to recommend Mr. Marshall for further employment, and finally to catalogue the prints of portraits, but I declined. On one of the last days of that month he sent for me and urged me again to do so, telling me that I was very foolish to refuse, and implying that if I complied with his request I should make an influential friend of Sir John Donnelly. This made me determined not to recommend Mr. Marshall. I at once consulted a friend—an experienced officer of the Department—who strongly advised me not to take any action in the matter, but to wait until I had a written request. Some days after I received from Sir Philip a slip of paper with these words, "When is the recommendation for Mr. Julian Marshall you promised me coming?" I then wrote the protest of January 2 quoted by Mr. Marshall, wording it in such a manner as not to give offence to Sir John Donnelly. I did not wish to make an enemy of my official superior.

On February 3, 1893, Sir P. Owen took upon himself to recommend Mr. Marshall, who, he stated, I know not on what authority, was recognised at the British Museum as an expert and specialist. On May 16, 1894, when the manuscript of the catalogue of national portraits was sent to the Stationery Office, I related the whole history of Mr. Marshall's appointment to Dr. Middleton. He said it would never do for him to put Sir John Donnelly's back up, and notwithstanding my protest, recommended that Mr. Marshall should go on with the cataloguing of the foreign portraits and also see through the press the catalogue of the national portraits.

I have not examined Mr. Marshall's technical descriptions, and therefore will not say anything about them, but, judging from the inaccuracies which crowd his biographical notices, I have no reason to assume that he has read the proofs of that portion of his work with greater care than the rest. In my opinion the plan of the book is inherently wrong, and the fact that it contains no index of either painters or engravers deprives it of nearly the whole of its usefulness to students.

As to Mr. Marshall's complaints with regard to the action of the committee I, of course, have nothing to say.

Mr. Julian Marshall in a second letter writes:—

The object of my former letter was to defend myself against certain charges of a very injurious character, which had been made by the select committee in their recent report, in reference to the catalogue compiled by me. I pointed out that the evidence before the committee in no way justified the charges in question, and that in any case they ought not to have been made without hearing what I could say by way of defence.

Lord Balcarres, in writing to defend the report, makes no reply whatever on the matters of which I have complained. He contents himself with citing passages from the report directed to showing that persons might have been found to compile a catalogue at a cheaper rate. This point might be well worthy of discussion at a suitable time, but it has absolutely no bearing on my complaint against the committee, and I therefore pass it by without further remark.

Lord Balcarres states that I am under a misapprehension in arguing that the committee did not give due consideration to the passages about the catalogue, and he mentions that a draft report, containing the "censure," had been before the committee a month before it was discussed. It is true that on June 24 Lord Balcarres proposed a draft report containing the "censure" in question, which draft was then read a first time. It did not, however, get beyond that stage, as the committee decided to work on another draft, namely, the one proposed by the chairman. Nothing further was heard of the "censure" until it was moved by Lord Balcarres on July 26 by way of amendment to the draft report. It is therefore strictly accurate to say, as I said before, that it did not come before the committee for discussion until that day.

As evidence that the "censure" received due consideration at the hands of the committee, Lord Balcarres mentions that certain amendments were made to it. My answer is that no amendments whatever were made to the paragraphs of which I complain; they were adopted, as I have said, *en bloc*, and apparently without question. Two verbal amendments were made in the latter part of the paragraphs quoted by Lord Balcarres in his letter, but, as I have already pointed out, these paragraphs have nothing to do with the subject of my complaint.

In reference to the alleged errors in the catalogue, Lord Balcarres states that in his copy he has noted "several hundreds more," meaning, I suppose, over and above the five instances selected by him as typical, and recorded in the "censure." I have dealt, in my former letter, with the five typical instances, and have shown by my examination of them how utterly feeble and flimsy is the foundation on which the charges against me have been rested. Lord Balcarres does not attempt to answer my criticisms, and he is probably wise in abstaining from doing so. As to the "several hundreds more" I can, of course, say nothing; but I cannot help having a suspicion that if they were critically examined a large proportion of these would prove to possess no better claim to serious consideration than the five typical instances above mentioned.

Lord Balcarres suggests that the catalogue may be conveniently tested by reference to the "Dictionary of National Biography." But he omits to mention that the later volumes of that work, which contains numerous corrections of the older authorities, especially in the matter of dates, had not been issued when I wrote. Would it not have been fairer if Lord Balcarres had tested the catalogue by reference to the authori-

ties which were accessible when it was compiled? Had he done this he would have had to make a notable deduction from the "several hundreds" of errors for which he holds me responsible.

In answer to my complaint that the committee condemned my entire work as worthless without any examination of that portion of it for which I was specially engaged—namely, the technical description of the prints—Lord Balcarres "imagines" that this portion would be found not less faulty than the rest. Can there be a plainer admission of the extreme precipitancy and want of caution with which he proceeded to pronounce judgment against the catalogue? Lord Balcarres did not think it needful to seek for evidence as to the value of the most important part of it. As to this he was content to rely on his imagination.

Lord Balcarres is good enough to say that the criticism of the committee was not directed against me personally. I must confess that I am unable to follow him in this. He has held up my work in contempt and ridicule, and has hinted, not obscurely, that my appointment was a job. I should have thought that this constituted personal criticism of the plainest possible kind. It is, indeed, small comfort to be told that the criticism was not aimed at me, but was merely intended to expose a system.

In conclusion I must express my regret that Lord Balcarres has not seen fit to grapple with the substance of my former letter. In particular, I should have been glad to learn his attitude on the following points:—

(1) Will he still, in the face of the evidence to which I have called attention, maintain that my appointment was a job?

(2) Will he maintain that it was right to condemn my work whole without any examination of the most important part of it?

(3) Does he hold that the committee acted rightly in condemning the catalogue, in language of extreme severity, without hearing what I had to say in defence of it?

(4) Does he think that the committee were justified in stating, on the evidence of a cutting from a newspaper, that the biographical notes were adapted by me from previous catalogues (a statement which I have shown to be untrue)?

(5) Will he affirm that the paragraphs of the report of which I have complained (as distinguished from the irrelevant paragraphs which he quotes), received any discussion at all in committee?

TESSERÆ.

Rules of Art.

THOSE who are terrified at the idea of established principles of art have not, perhaps, considered duly their real nature. They imagine, probably, that they comprise nothing but insignificant precepts, dictated by the fashion of the time. In this point of view they are deserving certainly of nothing but neglect; but the fact is that the true rules of art should be founded upon a theory deduced from the very essence and nature of the arts themselves, and not from any extraneous or arbitrary circumstances; and, thus considered, they start at once into importance. But the word theory is indignantly rejected by these objectors to rule. "It is precisely this theory," say they, "which is destructive to the genuine exertions, and to the unsophisticated talent of the artist; it binds down the imagination, produces works cold and formal, insipid, and destitute at once of freedom, power, or grace." All this would be true if, through ignorance or error, the word were applied to a false meaning. But it is in art as in all other things dependent on design and construction; there are certain essential principles inherent in the nature of the several pursuits which cannot be overlooked or violated without risking utterly the agreeableness of the result. At the same time, we are quite ready to admit that these should be as few and as simple as possible. Those rules of art which are of real service to the student teach him to distinguish between what is necessary to the perfection of his work and what is useful only. They are calculated to direct and suggest, not to enslave. They cannot bestow the power of genius on those who have it not, neither need they for one instant to repress originality, since there is abundant room within their limits for its exercise. They may, in short, be compared to sign-posts, which are only useful to such as possess the power of proceeding by them, which power they are entirely destitute of means either to increase or diminish.

Triple Windows.

The kind most usually practised is that familiarly known by the name of Venetian windows—although there are very few instances of it in Venice itself—and divided by columns into three openings, the centre one of which is both considerably wider and loftier than the other two, because, being arched, it has, in addition to the arch itself, the depth of the horizontal entablature over the columns and lateral openings, and from which the arch springs. When well composed windows of this kind have a particular rich and elegant appearance, besides the importance they acquire from their greater size, but all depends upon the taste shown in the particular design. If the lateral openings are too wide—that is, half the width of the centre one, the composition becomes sprawling and poor. On the contrary, if those openings or side intercolumns be kept narrow, not much wider than the diameter of the columns themselves, the whole has with greater compactness greater richness also. Kent has given us some good examples of this kind, as in the Park front of the Horse Guards; and so also has Sir Robert Taylor in a court within the Bank of England, where he introduced an entire series of such windows—a very unusual circumstance, and one which has in that instance a pleasing effect; but in general windows of the kind require to be placed singly, and in a break either in the centre or ends of a façade. They are, besides, fitted only for astylar composition, as they require greater space than accords with the proper intercolumniation of an order. When triple windows are introduced in elevations professing to be more in the Grecian than Italian style, it is now the practice to omit the arch and continue the entablature over all the three openings, at the same time making the latter nearly alike as to width, and substituting pilasters for columns. But nearly all examples of the kind have hitherto been either very poor in themselves or unfortunately applied.

Painters and Poets.

However admirable his taste may be, he is but half a painter who can only conceive his subject, and is without knowledge of the mechanical part of his art; as on the other hand his skill may be said to be thrown away who has employed his colours on subjects that create no interest from their beauty, their character, or expression. One part often absorbs the whole mind to the neglect of the rest: the young students, whilst at Rome, studying the works of Michel Angelo and Raphael are apt to lose all relish for any kind of excellence, except what is found in their works. Perhaps going afterwards to Venice they may be induced to think there are other things required, and that nothing but the most superlative excellence in design, character and dignity of style, can atone for a deficiency in the ornamental graces of the art. Excellence must of course be rare, and one of the causes of its rarity is the necessity of uniting qualities which in their nature are contrary to each other, and yet no approaches can be made towards perfection without it. Every art or profession requires this union of contrary qualities, like the harmony of colouring, which is produced by an opposition of hot and cold hues. The poet and the painter must unite to the warmth that accompanies a poetical imagination patience and perseverance—the one in counting syllables and toiling for a rhyme, and the other in labouring the minute parts and finishing the detail of his works in order to produce the great effect he desires. They must both possess a comprehensive mind that takes in the whole at one view, and at the same time an accuracy of eye or mind that distinguishes between two things that, to an ordinary spectator, appear the same, whether this consists in tints or words, or the nice discrimination on which expression and elegance depend.

"Mr. Richardson, sen. and jun."

One of the best painters of the head that appeared in this country was Jonathan Richardson—strength, roundness and boldness are in his colouring, but his men want dignity and his women grace. The good sense of the nation is characterised in his portraits. He lived in an age when neither enthusiasm nor fertility was predominant. Yet with a pencil so firm, possessed of a numerous and excellent collection of drawings, full of the theory and profound in reflections on his art, he drew nothing well below the head and was void of imagination. His attitudes, draperies and backgrounds are totally insipid and unmeaning, so ill did he apply to his own practice the sagacious rules and hints he bestowed on others. Though he wrote with fire and judgment his paintings owed little to either. No man dived deeper into the inexhaustible stores of Raphael or was more smitten with the native lustre of Vandyke. Yet though capable of tasting the elevation of the one and the elegance of the other, he could never contrive to see with their eyes when he was to copy nature himself. One wonders that he could comment on their works so well and imitate them so little. Richardson was born about the year 1665, and against his inclination was bound apprentice to a scrivener, with whom he lived six years; when obtaining his freedom by the death of his master he followed the bent of his disposition—at twenty years old became the disciple of Riley, with whom he lived four years, whose niece he married, and of whose manner he acquired enough to maintain a solid and lasting reputation, even during the lives of Kneller and Dahl, and to remain at the head of the profession when they went off the stage. He quitted business himself some years before his death, but his temperance and virtue contributed to protract his

life to a great length in the full enjoyment of his understanding and in the felicity of domestic friendship. He had a paralytic stroke that affected his arm, yet never disabled him from his customary walks and exercise. He had been in St. James's Park, and died suddenly at his house in Queen Square on his return home, May 28, 1745, when he had passed the eightieth year of his age. He left a son and four daughters, one of whom was married to his disciple Hudson. The taste and learning of the son, and the harmony in which he lived with his father, are visible in the joint works they composed. The father in 1719 published two discourses—1. An essay on the whole art of criticism as it relates to painting; 2, an argument in behalf of the science of a connoisseur, bound in one volume octavo. In 1722 came forth "An account of some of the statues, bas-reliefs, drawings and pictures in Italy, &c., with remarks by Mr. Richardson, sen. and jun." The son made the journey, and from his notes, letters and observations they both at his return compiled this valuable work. As the father was a formal man, with a slow but loud and sonorous voice, and in truth with some affectation in his manner, and as there is much singularity in his style and expression, those peculiarities, for they were scarce foibles, struck superficial readers, and between the laughers and the envious the book was much ridiculed. Yet both this and the former are full of matter, good sense and instruction, and the very quaintness of some expressions and their laboured novelty show the difficulty the author had to convey visible ideas through the medium of language.

Arches on Columns.

The practice by means of which the arch and column became amalgamated as integral parts of the same ordinance, viz. that of supporting arches upon columns, making them spring either directly from their capitals or from an entablature-shaped block over them, is almost uniformly condemned as barbarous and absurd. That it was introduced during the decline of the art and that it was an innovation subversive of former principles is not to be denied. Yet if it must be reprobated it ought to be so for its own demerits, not as an innovation, for all invention is such. It appears a very poor argument against it to say that columns were originally designed to support horizontal architraves; we do not see how that circumstance, of necessity, renders every other application inadmissible. At that rate we must censure as vicious a great deal of both Roman and modern architecture, where attached columns are employed merely as ornaments, yet as frequently as not in such manner as to produce a character of littleness and poverty, they being so small in proportion to the rest as to appear insignificant, and at such intervals from each other that all the beauty and harmony of a columnar ordinance is lost. Where columns are employed to support it certainly cannot be alleged that they are idle unmeaning expletives, nor that they are mutilated by being apparently partly embedded in the wall behind them. "A pier," it has been remarked, "is but a differently shaped and more massive column," which being granted, what impropriety can there be in employing the latter as a substitute for the other, provided it be done with judgment and discretion, and where upon the whole it will prove an advantageous mode of treatment? It certainly is a barbarous mode to turn small arches upon columns which are not more than between two and three diameters apart, of which we have examples in the basilica of S. Paolo, and Santa Agnese fuor delle Mura at Rome. The intercolumns are such that they might easily have been closed horizontally; indeed the openings between the columns have scarcely the appearance of being arches, but the whole looks as if the wall resting upon the columns was scooped out into diminutive arches over the intercolumns. In those instances, too, the arches themselves are quite plain, without archivolt or mouldings of any kind, and consequently all keeping is destroyed; the architectural embellishment terminates with the capitals of the columns, and so far the effect is similar to what would be produced by placing a plain horizontal mass upon a range of columns instead of a moulded entablature. Although one of an opposite kind, it is equally a fault to make the arches spring not immediately from the capitals of the columns, but from square fragments of entablature over them (as, for example, in the interior of St. Martin's; London), not only because such fragments are unmeaning in themselves and suggest the idea of the columns having been found too short for their intended purpose, but because they remind us quite unnecessarily of the original application of the column to the horizontal entablature. If entablature be admissible at all it is when the columns are coupled, for then some kind of architrave at least becomes requisite in order to connect the two capitals, as it were, together.

Polychrome Bronze.

Plutarch says that the sculptor Silanion made a statue of Jocasta, the wife of Laius, king of Thebes, in which she was represented dying. To increase the intensity of the expression of the countenance, the artist, by an ingenious mixture of the metals of which the statue was composed, had produced a pallid appearance. This, he says, was effected by the addition of silver. Callistratus admires a bronze statue of Cupid, by Praxiteles, for its elegant position, for the arrangement of the hair, its smile, the fire in its eyes, and, he adds, there was in its countenance a vivid blush. He observes the same thing, and with equal admiration and astonishment, of a statue by Lysippus. After describing the work generally, he says the cheeks were coloured like the rose, and those who saw it were struck with surprise at seeing the bronze imitate the appearance of nature. The same remarkable effect is noticed in a bronze statue of Bacchus by Praxiteles. To these may be added a statute of Athamas at Delphi, mentioned by Pliny. He was represented sitting after the murder of his son Learchus, whom he had precipitated from a rock. This work, he says, was not entirely of iron, for the artist Aristonidas, wishing to express the effect of confusion and remorse in the countenance of the king, used a mixture of iron and bronze, which should imitate in some measure the blush of shame. Other notices might be quoted of this practice of the ancients. The writers who refer to these effects describe them as the result of study and intention on the part of the artists, and do not allow us to suppose that the mere accident of oxidation and decomposition produced them. The art seems to be quite distinct from that called toreutic; the latter being the union of distinct materials, easily removable, while the former is described as effecting an amalgamation which produced shades or tints. The few writers who speak of it are certainly general in their observations, and give no technical details of the manner of effecting these combinations; but this hardly justifies the entire rejection of their testimony as to what they saw. It is most probable that they coloured the statues after they were cast, as Pliny says was done in Egypt. The different compartments and objects in the shield of Achilles are described as exhibiting different colours. This, however, whether the passage be Homeric and genuine, or interpolated at a later though ancient period, may have been a specimen of toreutic art. That the ancient sculptors increased, or imagined they increased, the effect of their productions in marble by adding colour, not only tradition but existing monuments testify. It is therefore not only possible but highly probable that they had some process with which we are unacquainted, by which they were able to produce some similar effects in their metal works.

Castle Howard.

The first notice we have of Vanbrugh as an architect is in 1702, when he furnished the design for Castle Howard for the Earl of Carlisle. Why he should have been selected for such an important work cannot be divined. There was no lack of architects in those days. Wren, though seventy years of age, was in his full vigour. Talman had finished Chatsworth, Thorsley and Dyrham. Wynn was engaged on Buckingham House, and Gunnersbury, Marlborough House, Roehampton, Cliefden, were all built within a few years of this period. Be this as it may, Vanbrugh here gave the first proof of his architectural genius. In endeavouring to avoid the rudeness of Gothic "magnificence," the "flutter of flying buttresses," "the uselessness of pinnacles," "the discord of oblique lines," our architects, with the exception of Wren, had fallen into a cold, tame, flat style, making square blocks of their buildings, without decided masses which cast bold shadows and give so much breadth. They affected horizontality, and strove as much as they could to get all the various departments of the house into one solid block. Such, too, was the passion for uniformity, that all sorts of expedients were resorted to to make one-half of the building exactly like the other, and false windows and doors, screen walls and parapets and all sorts of shams, were used to "balance" the points of the design. We seem now to run into the opposite extreme, and to go out of our way to make things irregular. Windows are made of various heights, and oriels are stuck here and there without meaning or any use, except for the studied purpose of making the building irregular, or, to use a common phrase, lop-sided. Vanbrugh avoided both errors. At Castle Howard he separated the subordinate buildings, and arranged them round the principal structure in a series of regular but picturesque groups. Even the laundries and breweries were not concealed, and were surmounted by domes, which served at once for ornament and the purposes of ventilation. Instead of striving to hide his chimneys, he clusters them together, and makes them, as well as his roofs, the means of breaking and enriching the sky-line. The main building is entered by a lofty portico, from which we pass into a noble hall lighted by a cupola 100 feet in height, and from which lengthened corridors extend, leading to numerous suites of fine apartments. Our limits will not permit a further description. Suffice it to say, that this picturesque but at the same time symmetrical building presents a frontage of 660 feet, or 130 feet more than the entire length of Westminster Abbey, and, with the exception of Blenheim, is the noblest palace in the kingdom.

NOTES AND COMMENTS.

Among the candidates for the membership of the Académie des Beaux-Arts, which is now vacant through the death of M. Charles Garnier, are the following architects:—M. Charles Girault, who designed the memorial chapel of Pasteur in the Rue Dutot, and is entrusted with the "Petit Palais" of the International Exhibition of 1900 in the Champs Elysées; M. Guadet, the architect of the General Post Office in the Rue des Louvre; M. Laloux, who is the architect for the new railway terminus which is in course of erection on the site of the Cour des Comptes, Quai d'Orsay; M. Moyaux, the architect for the new Cour des Comptes to be erected in the Rue Cambon; M. Paulin, architect to the Ministry of Public Works; M. Rouyer, architect of the Prefecture at Lille, the Hôtel-Dieu of Château-Thierry and the mairie of the tenth arrondissement, Paris; and M. Scellier de Gisors, who has charge of the Luxembourg Palace. The election will take place to-morrow.

It is astonishing what pains the world takes to keep the names of architects in obscurity. Very rarely are their names allowed to be inscribed on the buildings designed by them, and a statue of an architect is so novel as to become phenomenal. How many porcelain tablets recording the connection of architects with houses have been set up by the Society of Arts? The indifference to the reputation of architects, however, becomes more remarkable in Paris than in London, for in the French capital it is as easy to obtain a statue as a ribbon of the Legion of Honour. The great men are countless. But it is difficult to find room for an architect among them. The official spirit in dealing with architects was lately exhibited in a curious way. The Société du Vieux-Paris asked permission to set up tablets on two houses which were associated with two famous architects. One of them was François Blondel, known as "Le Grand" in the seventeenth century, who was entrusted with the general direction of the public buildings to be erected in Paris. Among his works is the Porte Saint Denis, the triumphal arch which is familiar to all visitors to Paris. He was "Royal Professor of Mathematics and Architecture," and his lectures at the Académie Royale d'Architecture can still be studied with profit. The second architect was Charles Garnier, a truly representative Parisian. The permission has not been given in either case. The endeavour to ignore Blondel and Garnier cannot succeed, for they will not be forgotten while the gate on the boulevard and the Opera House remain.

Any work which Mr. J. P. Seddon produces can command interest from its intrinsic value. But there are other reasons which will secure attention for his "King René's Honeymoon Cabinet," of which an illustrated monograph has been published by Mr. Batsford. It was designed in 1861 to hold architectural drawings. At that time there were some architects in London, Mr. Seddon being one of them, who were full of enthusiasm, for they believed that a new era for their art had opened. One of its characteristics was to be a co-operation of artists, and as the simplest works were to gain importance in that way, Mr. Seddon sought the aid of Dante Rossetti, Burne-Jones, Madox-Brown, Val Prinsep and others to adorn his cabinet with paintings. Naturally any designer would consider that the subjects should relate to architecture and the subsidiary arts, but an inspiration of Madox-Brown's, while recognising the suitability of such subjects, elevated them to a higher and more poetic plane. King René was to one class of artists and poets what the King of Yvetot was to Béranger and the two kings of Brentford to Thackeray. What was more reasonable than to suppose that René practised as well as patronised the arts, especially during his honeymoon? Accordingly he was painted as an architect by Madox-Brown, as a painter and sculptor by Burne-Jones, and as a lover of music by Rossetti. There were smaller panels which were representative of other arts. The cabinet itself appears to have too much notching and chamfering, but that arises from the prejudice which exaggerations of the treatment raised. The majority of the artists who co-operated in the cabinet have passed away, but Mr. Seddon is as enthusiastic, as competent and, we may add, as young as ever. His monograph will give pleasure to his numerous friends, and it deserves to be known far and wide in order to suggest what a simple piece of furniture can become in competent hands.

The importance which is attached to the teaching of the Ecole des Beaux-Arts in Paris is seen in the remarkable fact that all the architects who succeeded in the first competition for the Phœbe Hearst University of California, and are to take part in the final competition, were students of the famous school. Americans, Swiss, Austrians, as well as Frenchmen are in this case living evidence of the value of the instruction. France has reason to be proud of such a triumph, which is of more importance to the world than any *éclat* gained by planting the tricolor at Fashoda, or on the highest peak of the Mountains of the Moon. When it is remembered that the average number of students attending the school is over 1,000, of whom a large proportion are strangers, the importance of such a power for diffusing a knowledge of art becomes evident. No other institution has a similar attraction for people at a distance, and in comparison with it all English schools of art unfortunately appear to be only parochial institutions.

It is an advantage to belong to the public works committee of the New South Wales Legislature. In three years the last Parliament expended the large sum of 22,000*l.* among the members for fees and travelling expenses. The largest sum received by one member was 2,469*l.* during the three years and the lowest was 1,174*l.* Henceforth there will be more economy exercised, for by the Public Works Amendment Act of 1897 there are to be only seven members on the committee instead of thirteen, four being selected by the Assembly and three by the Council. It also provides that instead of receiving four guineas a sitting the chairman is only to receive three guineas, and instead of the members of the committee receiving three guineas they are to receive two guineas.

The third and concluding volume of Mr. Edwin O. Sachs's work, entitled "Modern Opera Houses and Theatres," will be published next month by Mr. B. T. Batsford. It comprises a treatise on theatre planning, with various supplements. This volume, as the others, will be grand folio size, and will comprise over 300 pages, with some 900 illustrations on plates and in the text. A feature of the third volume will be the particulars given in the introduction regarding the finance, staffing and management of the subsidised or endowed theatres of the Continent, which should be of some value at the moment when the proposal for a municipal theatre for London is under consideration. The main chapter of Mr. Sachs's treatise is devoted to the general arrangement of the playhouse, and the chapter next in importance deals with the auditorium. Among other chapters there is one dealing with safety of life, and another with service arrangements. The three supplements treat respectively of stage mechanism, theatre fires, and protective legislation. With the completion of the work every class of playhouse in Europe will be referred to, from Madame Patti's miniature auditorium at Craig-y-nos, or the casino theatre at Monte Carlo by Charles Garnier, to the most important opera houses of Paris and Vienna or the distant establishments in the Russian Caucasus. The international character of the work is suggested by all the references on the plates being in three languages. Volume I. was issued in 1896, and Volume II. last year, whilst the preparations for the work reach as far back as 1890. The subscription list closes on completion, and the price will be raised to fifteen guineas.

CATHEDRAL SERIES.—ST. ALBANS: FROM SOUTH-WEST.

ST. GEORGE'S CHURCH, STOCKPORT.

THE BALL-ROOM, THE PALACE, AMSTERDAM.

ST. MARY REDCLIFFE, BRISTOL.

IT has been usual to ascribe the foundation of the splendid church of St. Mary Redcliffe solely to Simon de Burton; its completion to William Canynges, the first of that name; and its reconstruction at a subsequent period to the grandson of the latter, who is always denominated William Canynges junior. John Britton, in "An Appeal for the Restoration of St. Mary Redcliffe," says:—"The church of Redcliffe is not only popularly called Canynges' work, but the topographers of the city also ascribe it to a person of this name. Hence much error and much confusion have prevailed. There were several persons named Canynges, two of whom appear to have been rich merchants, mayors and liberal benefactors to the poor and to the religious fraternities of Bristol. Barrett, Seyer, Evans, Dallaway and other antiquaries have failed to identify the works and deeds of the senior and junior members of that family; Seyer and Evans have not made out the true history of the edifice, nor was my former essay at all successful."

The Rev. James Dallaway, in his "Essay on the Life and Times of William Canynge," expresses an opinion that the first structure erected upon the site of St. Mary's "was not built before the reign of Henry III." and that "it was founded by contribution, oblations for indulgences, and legacies of those who had newly inhabited Redcliffe Street as the feudal tenants of the Lords Berkeley, in right of their great manor of Bedminster." But this opinion is opposed to that of all other writers upon the subject, for gifts towards the repair of a previous structure appear to have been made so early as 1207, 1229 and 1230. Various indulgences were also granted between the years 1232 and 1287, to all who should "devoutly visit the church of the Blessed Mary of Redcliffe in Bristol, and there charitably contribute towards the repair of the same, and pray for the souls of those there interred" (Barrett's "History of Bristol," p. 567). These indulgences are peculiar to the church mentioned by Mr. Dallaway, but all the former gifts certainly refer to a church constructed here before it is attempted to be shown by any writer that the oldest part of the present fabric was raised, and the documents referring to them are said by Mr. Britton "to have been found in Canynges' chests, and notwithstanding they were the gift of Chatterton to Barrett, their number, the difficulties that would have prevented their execution by the want of specific evidence to their fabrication and their coincidence with other documents, to which it does not appear that Chatterton had access, are in favour of their reception as genuine authorities."

The principal documentary evidence upon which it has been attempted to show that Simon de Burton was the founder of the church of St. Mary Redcliffe is recorded in Barrett, where is an account of this circumstance, which is said to have been "transcribed from a parchment manuscript of Rowley's communicated by Chatterton." Another authority is that noted by the Rev. Samuel Seyer in his "Memoirs of Bristol," vol. ii. p. 77; and a third is by Robert Ricaut, who was appointed town clerk of Bristol in the year 1479. An examination of the claims of these documents to credibility will necessarily first occupy a brief space before proceeding to ascertain how far the church itself verifies the truth of the statements contained in them.

With regard to the first of these authorities little need be said in the present day to convince the intelligent reader that small indeed is the amount of confidence to be placed in the writings of Chatterton, nor is it necessary to enter into a discussion in this place to disprove their authenticity. It will suffice to remark that the grave references to his forgeries by Mr. Barrett in many parts of his work are "indicative," says a recent writer, "not only of the profoundest architectural ignorance, but of a natural incapacity to imbibe any knowledge from observation." It is a subject of deep regret that this unfortunate youth should have palmed off so many writings upon that author as the productions of Rowley which are now rejected as spurious; and equally to be lamented that a writer should have received them from a mere boy with so little caution, and incorporated with his history so many documents of a dubious character. We are not surprised that the result of this culpable inattention should have cast a considerable amount of doubt over many portions of the narrative of that writer, and that perplexity should frequently embarrass the inquirer in his endeavour to separate truth from error and fact from fiction.

A few observations may now be offered on the statement of the Rev. Samuel Seyer and that of Robert Ricaut, the town clerk. The former says, "It was about the year 1293 or 1294 that Simon de Burton, a person of wealth and consequence who was mayor of Bristol in that year, and bore the same office six times, built the church of St. Mary Redcliffe, where the eastern end now is." The above is given by Mr. Seyer on the authority of manuscript calendars, the writer of which is not named; but as so many forgeries have been perpetrated in connection with the chronicles of ancient Bristol, we shall do well to withhold our assent from the correctness of this assertion until the genuine character of the document has been established beyond dispute; for it is a well-authenticated historical fact that all the calendars of acknowledged authority relating to the old town, and the validity of which was undoubted, were destroyed by an accidental fire in 1466, and in the same disaster perished also the valuable library of the Society of Kalendaries (who kept these records), said to have been rich in Saxon and later chronicles. These calendars were monthly registers of all public acts, including deeds, rolls, &c., which it was the business of this brotherhood to preserve, and the loss of which was irreparable. Of this fraternity Robert Ricaut was a member, and his chronicle (still in the custody of the Corporation) is a valuable register of all public transactions relating to Bristol from the year of his appointment as town clerk in 1479; and passing events are prefaced, as it would seem, with such notes of bygone incidents as either himself or his brethren could remember to have been preserved in the records which had been so unfortunately destroyed. On referring to this calendar it reads thus:—"1293. Thys yere the above sayd Simon de Burton (then mayor) began to builde Redclyf Churche;" no mention whatever being made of any particular part of the structure, as in Seyer's record, nor is another word added in registering the event to which the entry in the calendar has reference. Barrett, upon the authority of the parchment presented him by Chatterton, says that "Inne M.CC.LXXXXI. hee (Simon de Burton) ybuylden a godelye chyrch from a patterne of St. Oswaldes Abbyes Chyrche." Seyer and Robert Ricaut place the date of this event two years later, and the former of these two writers states that the structure was commenced "where the eastern end now is." That no such church was founded by Simon de Burton at the point indicated by Seyer will be clearly made out as we proceed to examine the fabric, and that both Barrett and himself were deceived by fictitious documents can scarcely be doubted, since the latter gives no authority for his statement, and the former relies on the testimony of a parchment coming through the hands of Chatterton. The record of Robert Ricaut also with regard to this circumstance would be entitled to much more respect could it be shown that he derived his information otherwise than from memory, thirteen years having elapsed between the destruction of all the authentic calendars of the city upon which alone any reliance could be placed and the time of his elevation to the office of town clerk.

Before quitting this part of the subject it may be mentioned that another manuscript (entitled "Hobson's") says, "Simon de Burton, mayor in 1294, had two years before began to build Redcliffe Church, but he lived not to finish it, which afterwards William Canynges did." This document, it will be seen, differs in point of date from either of the three before quoted; and the finishing of the church by William Canynge, as there stated, will be sufficiently shown to be incorrect as we proceed in our examination of the edifice.

Very little is known of Simon de Burton beyond the fact that he was an opulent merchant, and that he filled the highest civic dignity in old Bristol no less than six times; his last year of office being 1305, soon after which date he is believed to have died. His birth is stated in the parchment manuscript ascribed to Rowley and presented by Chatterton to Barrett to have taken place "on the eve of the Annunciation M CC.XXXXXXV.;" if so, he must have been steward or seneschal of the city at the age of twenty-five, and mayor when he had attained his twenty-sixth year only. This I regard as not merely incredible, but going very far to vitiate the validity of the document in its entirety. At twenty, according to the same manuscript (six years before he was first mayor), he engages in a tournament in the presence of "Kynge Edwarde," who "kepte hys Chrystmasse at Bryghtstowe," with "Syrre Ferrars Nevylle," who had already overthrown two knights in the rencontre, and "then dyd Syrre Symonne de Byrtonne avow that if he overthrowen Syrre Ferrars Nevylle, he woulde there erecte and buylde a chyrche to owre Ladye" on the spot where the struggle for the mastery took place, which was "on Sayncte Maryes Hylle." Having "encountered vygorously, and bore Syrre Ferrars horse and man to the grounde, remaynynge konynge, victore knyght of the jouste, ande settynge atte the ryght honde of K. Edwarde," he proceeded to fulfil his vow in the "ybulden a godelye chyrch," after the pattern before stated, and which on "the day of our Lordes natyvyty M.CCC.I. Gylbert de Sante Leonfardoe, Byshope of Chychestre, dyd dedicate it to the Holie Vyrgynne Mary, Moder of Godde."

From the foregoing remarks it is certain that little reliance can be placed upon the documents adduced to prove that Simon de Burton founded Redcliffe Church. Barrett's authority is a manifest forgery, those of Seyer and Hobson may be classed in the same category, and the most respectable of all is deprived of much of its credibility from the fact that it must have been recorded through the aid of memory alone. None of them agree in the particulars they have stated, either as to date or circumstances; hence they are all alike open to suspicion, and until some more positive and trustworthy evidence is brought to light, proving beyond dispute that Simon de Burton at his

own sole cost founded any particular portion of the church, we are bound to discard the vague and uncertain testimony contained in the documents above cited, as altogether, in this matter at least, unworthy our regard.

From these unsatisfactory sources of intelligence let us proceed to the structure itself, in examining which a very careful investigation of its many parts, as well as a cautious consideration of the various styles of architecture observable in the building, is necessary before we can arrive at anything like a safe conclusion regarding the date at which the several beautiful portions of which it consists were erected.

In prosecuting these inquiries, it will be obvious that the oldest parts of the edifice have a primary claim upon our attention, for with them our examination will, as a matter of course, have its commencement. An attentive inspection of this church will show that the first erections of the present structure were the lower stage of the tower, the interior north porch, and the most westerly arch at the end of the north aisle of the nave. All these portions are of pure Early English architecture, and the date of their construction not later than the year 1250—that is, upwards of forty years before it is stated in either of the calendars quoted that "Simon de Burton began to builde Redclyf Churche." It is clear therefore that of these parts of the structure he was not the founder, and we must look to some other portion of the edifice for the work of this wealthy individual.

In addition to the examples of Early English architecture already referred to, it appears extremely probable the first church on this spot was finished in that style; for it is deserving of note here that in the present restoration of the structure it became necessary to remove part of the exterior wall on the north side of the chancel, between the clerestory windows and the parapet; in doing which portions of Early English columns were discovered, the reverse side of which was wrought into Perpendicular English panelling, this part of the church being constructed in that mode of building. The Early English parts of the fabric formed, as it seems portions of the structure founded here, as already mentioned, "by contribution, oblations for indulgences and legacies of those who had newly inhabited Redcliffe Street, as the feudal tenants of the Lords Berkeley, in right of their great manor of Bedminster." Its continuation was effected by means of the indulgences which had been granted between the years 1232 and onward to the close of the period assigned by Mr. Britton to the duration of the Early English style, which terminated about 1272, by the gradual introduction of the Decorated fashion at that time.

Before passing on to notice those parts of the church erected in the latter style, it should be remarked that Leland makes no mention whatever of, nor does he even allude to, Simon de Burton having any connection at all with the building of the church of St. Mary Redcliffe, although he refers to other matters with which his name was undoubtedly associated. His words are ("Itinerary," vol. vii. p. 96):—"The almese howse of Seynt Thomas Churche is called Burton's Almes Howse. Burton, maior of the towne, and founder, is buried in it." He is equally silent also with regard to the existence of any documents relating to the subject; and this fact cannot but be regarded as at least negative evidence that no such writings as those quoted, excepting the calendar of Robert Ricaut, were then known to be in existence. Even this, examined by Leland, would have been rejected as unsatisfactory, because, as he would discover, recorded but a few years before, and then probably only from memory.

Finally on this point, as no reliable testimony has yet been produced to show that Simon de Burton did more with his wealth than found an almshouse in the parish of St. Thomas, and which remains to this day, it is not very likely he began to build a church in that of St. Mary Redcliff, a parish in which he does not appear to have had any greater interest than many other wealthy men of his time; nor does he seem to have even possessed any property whatever in it. That he contributed towards such an erection is highly probable, and perhaps he laid the foundation-stone of some part not yet referred to; and this is likely to be the meaning we are to attach to the calendar of Robert Ricaut. Had he been the founder of the church or begun in reality to build it as the record would seem to intimate, surely he would have been entombed in it rather than in an almshouse. It must be remembered also that many wealthy merchants and opulent families resided in Redcliffe parish in the time of Simon de Burton, whilst the little we know of the latter rather induces the belief that his domicile was situated in the neighbouring parish of St. Thomas.

We may now turn from the Early English portions of the church, and with the erection of which it is evident Simon de Burton was in no way connected, to the next oldest part of the structure, which will be found in an arch opening on the north side of the nave into the space beneath the tower, the mouldings of which connect it with the acutely-pointed lancet arch before mentioned. Above these, the majestic superstructure of the tower rises in all the beautiful proportions and finished excellence of the Decorated style. From the fact that the first-named arch is an early specimen in the latter fashion, we are disposed to believe this was the last built of the four sides which comprise the first stage of the tower, the other three being, as we have seen, constructed in the Early English mode of building, later insertions being excepted. But even in this arch we shall not find anything to connect the building of the church with Simon de Burton, the date of its erection appearing to be not later than 1280; that is to say, it was constructed at a very early period after the discontinuance of the Early English fashion in 1272, and the adoption of the Decorated style which immediately followed.

In the continuance of the superstructure of the tower and the construction of the exterior north porch, both being in the last-mentioned mode, we recognise a new era in relation to the erection of this fine building. As the former parts undoubtedly progressed by means of funds supplied by the wealthy inhabitants of the parish, with the assistance of such non-residents as were friendly to the undertaking, the previously-erected structure—towards the repair of which indulgences had long been granted and gifts had been bestowed—was by degrees removed, to make way for a fabric commensurate with the ideas of those noble-minded men as to what was the befitting house for the worship of God. The result of this benevolence, next to the continuance of the tower, was the erection of an exterior north porch in the same costly style of architecture, which should vie with any known example, and with the construction of which the name of Simon de Burton is imperishably linked, if it be linked with the building of the church at all, as the date of the foundation of this part of the structure is undoubtedly referable to the commencement of the fourteenth century, at which time Simon de Burton was chief magistrate of Bristol.

The construction of a building of such magnitude as the tower of this church was an important undertaking at that time, and must have occupied its projectors for a considerable period. It is customary to regard the first William Canynges as the builder of the entire of this part of the edifice, but this opinion cannot be sustained, for, however we may revere his memory and accord him all due honour in connection with the erection of this church, it must not be forgotten that the Le Fraunceys, De la Rivieres, and many other rich merchants, as already intimated—contemporary both with de Burton and himself—were undoubtedly engaged in the pious undertaking; and the truth in all probability is that, having resolved to rebuild the church on a more extensive scale, they proceeded with the tower, and then, while it was progressing, added the exterior north porch, the foundation-stone of which was most likely laid in due form by Simon de Burton—a compliment paid him by his fellow-townsmen as their chief magistrate. To the church of St. Mary the Le Fraunceys were great benefactors, and in it they had founded chantries in the time of this first William Canynges. Here also they were sepulchred, and it is but reasonable to conclude that they contributed towards the erection of the structure with a liberality equal to that of either Simon de Burton or William Canynges, neither of whom seem to have resided in the parish, and only the latter, as will be shown, had any possession in it whatsoever. The only way in which the name of the latter is mentioned in connection with Redcliffe Church is that at his death he leaves twenty shillings only "as a customary dole to the vicar." "Is it probable," asks Mr. Dallaway, "that if he had built the church he would have so poorly remunerated its minister?"

But there is no doubt that with the erection of the tower and exterior north porch other parts of the church were also at the same time progressing; and, as the whole of the lower stage of the edifice throughout, from east to west, is constructed in the Decorated style, it would appear that with the finishing of the tower and the erection of the exterior north porch, the foundation of the entire church had been laid. As the two portions named may be regarded as examples of rather an earlier date in the style last mentioned, so the whole of the columns throughout the nave, chancel, transept and aisles to the summit of their capitals may be referred to as specimens of the same fashion, but erected at a later period—the tower and exterior north porch progressing in the time of Simon de Burton, who must have laid the foundation of the latter; and the body of the church in the pillars to their capitals from end to end of the building in that of the first William Canynges, who performed the same ceremony in regard to the latter portion of the structure. In the Mayor's Calendar he is said to have "built the body of Redcliffe Church from the cross aisle downwards, and so the church was finished as it is now;" that is, as we should understand it, he laid the foundation of the entire fabric eastward, beyond those parts already commenced, and which were advancing towards completion. On examining the will of this first William Canynges he is found to be described as a "merchant," but we search in vain for any gift or donation

bestowed in any shape whatever to the church of St. Mary Redcliffe; nor is any sum mentioned as being left to any person connected with it, except the pittance to its minister before named; and also "to the vicar of Redcliffe for tithes forgotten, six shillings and eightpence;" which must have remained unpaid for the only solitary small tenement he possessed in the parish. As therefore all the property of this first William Canynges, with the above exception, lay in the parish of St. Thomas, where also he carried on an extensive manufacture in cloths, and in the church of which both himself (says his will), his wife and his son John were buried, surely it is a fair presumption that at most he, like Simon de Burton, merely contributed, with the Le Fraunceys and others who resided in the parish, and who possessed nearly the whole of it, towards the pious work: for that it was constructed by means of donations, legacies, &c., and not by any private individual, is clear from the fact that John Muleward, by will dated in 1388, bequeathed a sum of money "ad opus Beatæ Mariæ de Radcleve," which sufficiently proves that the church was then in process of erection. Barrett observes ("History," p. 569) that "William Canynges was a merchant of great fortune, weight and respect among his fellow-citizens; in a station of life fitted to be a leading man, and to have the character of a founder of such a work, promoted no doubt by donations by will and voluntary contributions of other devout and well-disposed people, as well as by grants and indulgences from the bishops of those days." To this testimony it may be added that no record whatever has yet been brought to light to prove that this first William Canynges was in any way connected with the erection of the structure before us, other than as a contributor, the circumstance of his being the founder of the church, as generally reported, resting entirely upon unconfirmed tradition and some scattered MSS., to which no value is attached, because probably the forgeries of Chatterton.

It is well known that the erection of nearly all our large ecclesiastical structures was uniformly commenced at the east end; but in the building before us it is manifest on examination that this course was departed from, for the only portion of the church which exhibits any Decorated English architecture above the capitals of the columns, rising from the foundation, is the south transept, which throughout may be regarded as a beautiful example of that rich and elaborate mode of building, every column, capital and window, with the tracery which adorns them, being wrought in that elegant style of architecture. It is not improbable this south transept may be regarded as peculiarly that part of the edifice to which the first William Canynges more especially contributed; but its completion was not accomplished until the Decorated English fashion in architecture, which almost imperceptibly glided into the Perpendicular style, had commenced what has been appropriately denominated a "transition style," when it is sometimes extremely difficult to determine by what name to designate particular examples. This remark is peculiarly applicable to the vaulting of the roof and other portions of the upper part of this transept, so nearly allied is it to both the Decorated and the Perpendicular styles of building. The whole interior of this part of the structure may, however, be classed generally under the former fashion, and its completion, both internally and externally, to the moulding which runs round the church beneath the parapet on the outside may be regarded as having been achieved during the lifetime of the first William Canynges. It is worthy of observation that while the entire superstructure of the exterior of the body of the church—the nave, north transept and chancel—except the east end of the latter, is adorned with panelling in the Perpendicular style, this south transept only should be totally devoid of any such adornment, the walls being quite bare.

This transition from the Decorated to the Perpendicular style of English architecture is more observable in the windows of the structure than in any other part of it. The large window in the north transept exactly corresponds with that in the south transept opposite, both being of pure Decorated design. Those also in the aisles of the former part of the building are for the most part Decorated English also, but in some respects they so closely approximate to the Perpendicular style that it is difficult to decide to which fashion they really belong. In the east window of the chancel the resemblance to the Perpendicular style is more decided, the lateral mullions indicating the first approach towards the new fashion by running directly into the head of the arch, while every other feature of the window is Decorated English, a style just discarded when the death of the first William Canynges took place, and the advent of the Perpendicular mode was about to be ushered in by its universal adoption as a national style of architecture. In this new fashion in building the whole of the superstructure of the church is constructed, and to the invention of which the preceding remarks have gradually conducted us.

Mr. Barrett, at p. 570 of his work, says that the first William Canynges "lived to the year 1396, when the church was probably finished;" but this is a great mistake, for, as the Decorated style ceased to be practised about the time that worthy man died, it is obvious that those parts of the church only which have already passed under review could have been erected previously. For the building of the remainder we must undoubtedly proceed to a period subsequent to that event; and to ascertain when those portions of the structure not yet noticed were constructed we must again refer to the church itself as the only sure guide in such an inquiry as the present.

(*To be continued.*)

HISTORICAL EXHIBITION OF DRAWINGS AND PRINTS.

A SPECIAL exhibition of drawings and prints, showing the rise and development of popular illustration from the time of Dürer and the early Italian draughtsmen upon wood to the present day, is now being organised by Mr. Cecil Burns in connection with the South London Art Gallery. Apart from the artistic interest attaching to the drawings, it will, he thinks, prove of educational value to students and of great interest to artists to trace the influence exercised by the method of reproduction upon the style of the draughtsmen at various periods—from the ancient drawings done on the wood planks, through the copper engravings which supplanted them, and again through the boxwood engraving popularised by Bewick, to the modern photo-mechanical process block.

Owing to the fact that the South Kensington Museum can only lend their large exhibition for the short space of two months, Mr. Burns is anxious that students and the public should know of the opportunity afforded them, thanks to the generosity of many well-known collectors, who have placed drawings which may never again be at his disposal.

The exhibition opens on Monday, November 7, and will continue open till early in January. It is open free to the public from 2 P.M. to 10 P.M. Mr. Cecil Burns is at the same time collecting as many pictures as he can by those artists represented by black and white drawings, amongst whom are such masters as Walker, Sandys, Pinwell, Sir J. Gilbert, Houghton, C. Keene, E. A. Abbey and A. Parsons.

THE USHER HALL SITE, EDINBURGH.

ON the 13th inst. a meeting of the Edinburgh Town Council was held to reconsider the reports on the Usher Hall site. The proceedings were mainly transacted in private. It was understood that the members restricted themselves to a large extent to the discussion of the sites in regard to which figures had been supplied by Mr. Hamilton Beattie. Mr. Waterhouse's report on the æsthetics of the question was not referred to, and nothing was said as to the West Meadows or St. Andrew Square being considered as possible sites. There was a strong feeling that it would have been a very suitable thing that the hall should be erected in the High Street, but it was felt that Mr. Hamilton Beattie's figures put that site out of the question. The only two sites that held the field were Chambers Street and Atholl Crescent. The price of these sites was a leading reason why they were supported, and that Atholl Crescent had come out so nearly at the same figure in the two reports was a point made in its favour.

Subsequently the public were admitted to the discussion. A division followed, when thirty-two votes were given for the Atholl Crescent and five for the Chambers Street site.

Mr. Hamilton Beattie, in his report on the various sites, referred to Atholl Crescent as follows:—"I have gone over the property on this site, and have also looked into the rentals and information which you sent me. I find from the plan of this site that the main site is coloured red, but that four outlying blocks to the east in Canning Street Lane are hatched red, and that they are included in the rentals sent me. In my opinion these four outlying blocks are not required for the site, and I valued the site on the footing that they are excluded. On this basis I find that the total rental of the property, as appearing in the assessor's roll, is 2,190*l.*, and that the total feu duty is 224*l.* 6*s.* If the Corporation decide to acquire the three outlying lots to the east (excepting the part of Messrs. Mackay & Co.'s factory), the additional cost for the three properties, feu-duties, compensation to occupiers and expenses will be 5,500*l.* sterling."

Mr. Waterhouse, in his report on the same site, said:—"Atholl Crescent presents, in some respects, an attractive site. The building there would have but one front, and that facing north-west. I think I need hardly point out that the north is the worst possible aspect for a beautiful work of architecture. Its beauties are, in that aspect, only half appreciated. The new station might prove a noisy neighbour. It would be difficult for the public to approach the hall, except from the Atholl Crescent side, and if the hall is made capable of holding an audience of, say, nearly 4,000 persons, that would be a serious

disadvantage. The two crescents consist of houses modest in height, and though now attractive enough, enclosing, as they do, the central gardens, their effect might be seriously maimed by a great building in their midst."

CAMBRIDGE ENGINEERING SCHOOL.

IN his opening lecture to the engineering students at Cambridge on Friday last Professor Ewing intimated that the crowded state of their lecture-rooms and laboratories would soon be relieved. A gift of 5,000*l.* had just been made for the addition of a new wing to the engineering laboratory in memory of the late Dr. John Hopkinson and of his son, John Gustave Hopkinson, who recently lost their lives in the Alps. Dr. Hopkinson's son was to have begun work at this time as a student of engineering at Cambridge. This splendid and most welcome gift was made by Mrs. Hopkinson jointly with her son Bertram and her surviving daughter. Professor Ewing went on to say :—I feel compelled to add a few words as to the loss which our profession—the profession on which you look forward to entering—has met with in the untimely death of Dr. Hopkinson. If I were to select any name to put before you as that of an engineer whose works and methods you would do well to follow, it would be his. He was a peculiarly conspicuous example of that union of scientific knowledge and genius with practical sagacity which goes to make a great engineer. His work was brilliantly original; in more than one department he led the way where a great host is now following. And his work was as sound as it was brilliant. His opinion was constantly being sought, partly because it was always fair and unbiassed—his character was too fine for anything mean or unworthy to find a place—and partly because his judgment came near to being infallible. You know that he took in Cambridge the most distinguished place that any student can take. He at once plunged into engineering work, and from that time to the end his professional life was an unbroken series of successes. But he made time for much original work of lasting value in science, and the world of pure physics is deploring his loss as much as it is deplored by engineers. Such a man may, I think, be said to live on, not only in the results of his work, but in the force of his example. Dr. Hopkinson took from the first a warm interest in this laboratory and in the establishment of an engineering tripos at Cambridge. It was only a few days before his death that he spoke to me of his intention to promote a subscription for the much-needed extension of the laboratory. It is a peculiar pleasure to me to think that this laboratory will, through the noble gift of Mrs. Hopkinson and of his son and daughter, be henceforth associated with his memory and name.

THE BROOK HOSPITAL.

ON Monday Mr. W. E. Knollys, C.B., chief inspector of the Local Government Board, assisted by Mr. Gordon Smith, architect, opened an inquiry into the circumstances attendant on the erection of Brook Hospital by the Metropolitan Asylums Board in August 1896.

Mr. Knollys said, according to the *Daily Chronicle*, that the inquiry originated on the application of the Asylums Board to borrow 100,000*l.*, in addition to 200,000*l.* already sanctioned for the erection of Brook Hospital. He was instructed to inquire into the circumstances which had led to the large excess of the expenditure over estimates, the responsibility of the architect, and the amount of supervision exercised by the managers of the hospital committee. On February 6, 1894, the proposal for the erection of a hospital at Shooters' Hill, to be called Brook Hospital, came before the Local Government Board. The accommodation was to be for 500 patients, and the cost 194,000*l.* It was stated that the original estimate was for 220,000*l.*, but was reduced by 26,000*l.* After some correspondence, the Local Government Board gave their approval, subject to further consideration by the committee of certain questions of detail which had arisen. The Local Government Board also intimated that they thought the estimated cost still very high. Subsequently an application was made for power to sanction certain expenditure on roads, &c., and the Local Government Board replied asking for details and another estimate of the total cost. The latter was then returned by the Asylums Board at 226,000*l.* In August 1894 an order was made for a loan of 200,000*l.* On October 14, 1896, a report was furnished showing an estimated expenditure of 280,000*l.*, and asking for a further sum of 75,000*l.* The Local Government Board wrote for further information, and on August 5, 1897, it was reported that the architect estimated the total cost of the buildings, &c., at 268,000*l.*, but that the probable total outlay would be 303,000*l.* The committee appeared to have carefully gone into the matter, and he presumed that the report they made might be accepted at this inquiry. What he had to inquire into was the difference between the tenders of 218,000*l.* and the expenditure of 268,000*l.* Then they would further have to inquire into how it was that the total cost for everything would be brought up to 303,000*l.*

Mr. Duncombe Mann, the clerk to the Asylums Board, said that everything paid up to date amounted to 268,168*l.* 6*s.* 4*d.* Mr. Mann proceeded to give formal details of the steps taken by the board for the building of the hospital, their usual custom in such cases, &c. The inspector asked Mr. Brown, ex-chairman of the Brook Hospital committee, whether the committee inspected the site and were satisfied as to the necessity of improving the foundations, and the expenditure.

Mr. Brown : Unfortunately the necessity was not seen until large areas of ground had been opened.

The Inspector : How was that?

Mr. Brown : As the work proceeded it was seen that the clay was full of soapy veins, and that it would be necessary to take it out and have a firmer foundation. It never dawned on any of the committee that the cost would come to 19,000*l.*; but then this work was going on for twelve months.

If you had had any idea that the amount of 5,000*l.* was being so largely exceeded you would have felt it your duty to bring the matter before the managers?—Yes.

Was there any explanation subsequently given by the architect as to why he did not bring it before the committee?—I think, speaking generally, that he considered the committee recognised the necessity of the work being carried out.

Nothing more was said to the committee till the final accounts were presented?—Not as to the expenditure.

Mr. Brown went on to say that the expenditure on drainage was much larger than had been anticipated, and certain things were ordered without the knowledge of the committee, while the latter ordered small alterations without reporting them to the managers. The contracts should have provided for contingencies, but they did not, and his committee only came on the scene when the work was actually in progress.

There was no provision for the heating, and tenders were called for from selected firms, the lowest of 10,900*l.* being accepted.

The Inspector: How was it that these extra expenses were incurred without your pulling up the contractor?—If we had known about them we should have pulled him up, but if you could realise the rush of work which we had to deal with in twelve months you would not be surprised at some matters escaping us.

"At one time," added Mr. Brown, "we were in terror about the hospital," and he went on to explain with regard to certain other items that the committee had "not the remotest idea" that they were not included in the contracts. Nevertheless, the members of the committee were "very interested in the work," and applied their energies to getting the hospital finished in order to accommodate the fever cases in the autumn. The boards of guardians all over London were at that time clamouring for more accommodation for patients.

The Inspector: I am not quite satisfied that the committee were sufficiently on their guard.

Mr. Brown: I thought we were at the time.

Mr. Aldwinckle, the architect, in reply to the inspector, said he considered that in all he did he was justified by the general orders of the committee. With reference to the foundations, they gave him authority to do what was necessary. If he had not done what he did, he would have been failing in his duty. He did not select the site, but he did the best he could with it. The hospital was excellently finished, and no money was wasted.

The Inspector: You reported that the foundations would have to be made secure at a cost of not less than 5,000*l.* Were you aware it would cost more?—I became aware of it as time went on.

Did it not occur to you to bring that before the committee?—I thought they were aware of what was going on. They frequently visited the works, and it was a matter of common conversation that we were expending a lot of money.

The Inspector : Yes, but Mr. Aldwinckle is not the authority to tax the ratepayers, whereas the Asylums Board is. If the board had been aware that there would be such a large expenditure on foundations they might have gone to another site?—Very likely, but I had to prepare the plans in a great hurry, and had not time to go into all the details and examine everything. If I had had the requisite time I might have said, "Gentlemen, you will have to spend so much on this site that you had better go elsewhere."

Mr. White said Mr. Aldwinckle was in no way answerable for the site. He was simply told to build on it. The trouble with the foundations was largely due to the Local Government Board requiring the managers to "set back" the hospital so that, instead of its being on the plateau, it was "pushed down the hill." As it was, Mr. Aldwinckle, in his original estimate, put down 3,500*l.* extra for the foundations.

The inspector then adjourned the inquiry.

On Tuesday the inspector stated that he intended to put

down the details of the expenditure under five heads, viz. necessary expenditure with the consent or knowledge of the committee, similar expenditure on the architect's responsibility or that of the managers, and other expenditure with or without authority.

Resuming his examination of Mr. Aldwinckle, the architect, the inspector asked:—

Do you acknowledge that you were aware that a large extra expenditure was being incurred with regard to making good the foundations?—I was aware that we were spending more than 5,000*l.*, but I did not know that the total would be so much.

Did not the clerk of the works realise that over 19,000*l.* was being spent?—He would only have to do with the accounts. His responsibility would be covered by my own.

Yes, but he might have called your attention to the fact?—There was no necessity for his doing so. I frequently visited the works, and I accept the responsibility of what was done.

Yes, but you reap an advantage from the disbursements?—I did not think any one would suggest that I had this work done for my own benefit.

No one has suggested it; but I say that, for your own protection, when you found the cost running up, and knowing that you would benefit by it, you might have reported it.—I never thought such a suggestion would be made, at all events, by my clients.

The suggestion is not that you encouraged the expenditure, but that you did not report an increase from which you would reap a benefit.—I question the benefit, sir, taking it all round. If you are going to reckon it by pounds, shillings and pence it is one thing, and if you take the *per contra* element into account it is quite another.

Mr. Duncombe Mann (clerk to the board) said that he understood Mr. Aldwinckle to mean that he did that which he thought to be absolutely necessary, and by doing so had incurred a great deal of criticism and done himself more harm than good.

Mr. White observed that Mr. Aldwinckle evidently underestimated the work originally contemplated by about half. He said it would cost not less than 5,000*l.*, and it then represented about 10,000*l.* Speaking from experience he (Mr. White) knew how difficult it was to give a rough estimate of work of this character. It was admitted, however, that Mr. Aldwinckle was in error in not communicating with the board.

In reply to the inspector, Mr. White said that although the managers built on the slope instead of on the plateau, through the action of the Local Government Board, Mr. Aldwinckle knew where the building was to be and prepared his plans accordingly.

Mr. Aldwinckle, replying to the inspector, said considerable alterations were made in the levels, but he did not report them to the committee or managers.

Was there any reason why you should not have reported the alterations?—Only because we were very busy, and I did not wish to cause any delay.

May I take it that 900*l.* was sanctioned on this head by the board, and 2,000*l.* was spent without their knowledge?—Yes, that is so; I thought I had the general authority of the board to do what was necessary.

Mr. White: But not without reporting.

Mr. Aldwinckle: Well, at all events, if I had not done what I did I should have been held to blame in case there was any instability of the building.

The Inspector: That does not answer the question as to your not reporting the work to the committee.

Mr. Aldwinckle: Well, sir, I am getting used to making admissions. Perhaps you won't rub it in too thick.

Mr. Aldwinckle further stated that the estimate for the drainage was 13,326*l.*, and this sum was exceeded, owing to numerous causes, by 4,980*l.*

The plans having been produced, Mr. Brown, looking at the drawing of the water-tank, said he must confess that it did not convey to his mind the size of the enormous tank which had been erected.

Mr. Aldwinckle: It holds 200,000 gallons of water, and is frequently full. It is invaluable for the purposes of storing soft water.

With regard to sundry other items, Mr. Aldwinckle said he really did not know whether he ought to have reported them, but at all events he did not. He added:—There was no provision in these contracts for contingencies, as is the usual practice. If there had been such provision, I should not have got into trouble.

The Inspector: I don't think you can deal with a public building as you would with a private one. You must remember that the committee charged with the erection of a public building are trustees for the money of the ratepayers. They should be more careful of public money than they should be of their own.

Mr. Aldwinckle went on to give details with regard to the construction of a covered way and the substitution of fireproof flooring for wood. The former stood out for notice on account of a technical arrangement, and the latter was sanctioned by the committee, but cost more than was expected.

Improved stoves were obtained for the wards. They were privately ordered because they were required to be of peculiar construction and were really part of the general work. The stoves obtained were of excellent quality and moderate price.

Mr. Gordon Smith (architect to the Local Government Board) said that other institutions had to be content with iron stoves.

The Inspector: You placed the order with a firm of your own selection?—Yes, but I took great care over the matter and got the stoves at a reduced price.

Mr. White: It comes to this; the stoves cost 66*3l.* more than Mr. Aldwinckle originally advised the committee.

Mr. Brown stated that certain alterations to the heating apparatus were known to the committee, but in the hurry were not entered on the minutes. The same remark applied to railings in the interior of the buildings and several other items.

The painting, which cost 1,000*l.*, was omitted from the original contract, because it was understood that the hospital was to be built in a year, and in that case the paint could not have been applied to the wall in safety. The building took two years, and therefore the painting was done.

Mr. White said the committee noticed the painters at work, but supposed it was included in the contract.

Mr. Aldwinckle said the work was so obviously necessary that he did not report it.

After the adjournment, Mr. Abraham Monson, a member of the Asylums Board, made a statement to the effect that he had studied the case, and had come to the conclusion that although the architect was instructed to prepare plans for a hospital on Shooters' Hill, he prepared plans for a hospital on the flat. The site was made to fit the plans, instead of the plans being made to fit the site. As to the nature of the ground, it could easily have been ascertained by sinking "trial holes." Moreover, the work as carried out was not in accordance with the plans approved by the Local Government Board.

Mr. Aldwinckle denied the accuracy of these statements, and produced the plans, which Mr. Knollys inspected.

In every case, Mr. Aldwinckle contended, provision was made for the exigencies of the site. Before making the plans he went carefully over the site and surveyed it. He allowed for the "slope" at Shooters' Hill, but part of the buildings were on the flat.

Mr. Monson said it was impossible for him to follow all the plans, but he contended that the whole of the circumstances in connection with Brook Hospital were disgraceful.

Mr. Brown: These irresponsible statements have been made so often that it is time they came to an end.

Mr. Duncombe Mann submitted to the inspector that Mr. Monson's "reckless allegations" had not been proved. The plans spoke for themselves.

In reply to Mr. Monson, Mr. Aldwinckle emphatically denied that the building was carried up "on piers."

Mr. Monson said the extra cost of the hospital was caused by shifting the earth to make it fit the building.

The inquiry was adjourned, with an intimation from the inspector that if any managers wished to give evidence they would be heard.

The inquiry was resumed on Wednesday, when Mr. Aldwinckle produced a further list of "extras," including an item of 363*l.* for fire insurance. Questioned as to this, he said it was an item in excess, because the work was stopped on account of the severity of the weather, and two instalments of insurance had to be paid instead of one.

The Inspector: I can't understand how it was the sum was paid to the contractors without the Board knowing what it was for. Here is a public body dealing with public money, which they pay over without inquiry, on the production of a certificate by their architect. I particularly require information on this point.

Mr. Duncombe Mann (clerk to the Board): When a public body accepts a contract, they are bound to pay the amounts certified for by the architect.

The Inspector: That does not affect the fact that it is the duty of the Board to inquire of the architect what the sums are for. From time to time the Board should require a financial statement from the architect, showing how the sums he has certified for have been arrived at.

Mr. Mann: That has been done. We have had an inquiry analogous to the one you are holding now. The Board employs competent architects and surveyors.

The Inspector: Therefore they are to accept, without question, everything put before them.

Mr. Mann: We call for explanations of additional expenditure.

The Inspector: Long after it is made, and when it is too late. I suppose I am to take it that no proof of that 363*l.* can be produced. I understand you to say that the Board goes on making payments on account, on the architect's certificate, till

the work is done. No one can justify a public body placing the expenditure of public money in the hands of one individual.

Mr. Mann: The final account is examined.

The Inspector: What percentage of the final account is kept in hand?

Mr. Mann: In this case I think it was as much as 10,000*l.*

The Inspector: Yes, but there is an excess of 100,000*l.*

Mr. Mann: This is an exceptional thing, and the Board began inquiry after they had paid away 150,000*l.*

The Inspector: I can't understand why the architect was not pulled up.

Mr. Mann: Do you mean the work should have been stopped?

The Inspector: No; but he should have been told that he must report extra expenditure to the committee.

Mr. Mann: That was done in pretty continuous fashion.

The Inspector: Then you say that the architect continued ordering these extras notwithstanding continued warnings from the Board?

Mr. Mann: No, I don't. I say the whole of the extras might have been included in the 150,000*l.*, after the payment of which the Board began inquiry. We then knew we were committed to about 220,000*l.* Exhaustive inquiries were made, and a report was sent to the Local Government Board.

The Inspector: Nothing has been sent to the Local Government Board to show that the architect was warned by the Board as to spending money without authority.

Mr. Mann: The enormous excess was not apparent till the whole thing was done and it was too late to warn anybody. I don't want to shield the Board behind its officers, but I do protest against the assumption that the Board has not done its duty.

The Inspector: It is not for me to say that, but I have to elicit the way in which the Board does its business and report to the Local Government Board.

Mr. Brown, ex-chairman of the Brook Hospital committee, tendered some further explanations.

The Inspector: It cannot reasonably be contended that any public body should have the power of spending money with any one man. Mr. Mann's contention is that they have no right to question the architect's certificate. I have never heard of that before in connection with a public body.

Mr. Mann: It is a question of law. The Board is bound to pay its contractors.

The Inspector: Yes, but there is a duty resting with the Board to see what the certificates are granted for.

Mr. Mann: That would imply suspicion of the architect.

The Inspector: Why not? All public bodies should hove such a suspicion. They should not accept anybody's statement without proof.

Mr. Mann: Well, we employ men who would throw up their contract if that was done.

Mr. Monson, a member of the Board (to the Inspector): You have raised one of the most important questions in connection with the proceedings of the Board. Neither on the finance or the works committee can I get any details of the accounts. This is a very serious and a very sore question with many members of the Board.

Subsequently Mr. Brown stated that certain small items were authorised by himself, in company with other members of the committee, in going over the building.

Mr. Mann: I must say that I cannot accept anything as authorised by the committee unless actually ordered by the members in regular meeting. It would be a dangerous principle to admit the right of one member or several members to order work in the name of the whole committee.

Mr. Brown: I quite agree with you, and am ready to accept full responsibility for everything I did.

At a later stage Mr. Mann stated, in reply to Mr. Gordon Smith (architect to the Local Government Board), that the architects of the Asylums Board were not appointed "under the seal of the Board."

Mr. Smith: I always recommend that that should be done, and the Asylums Board should insist on it. In that case you can introduce what terms you like.

Mr. White, chairman of the special committee which inquired into the matter on behalf of the Board, said the whole of the extras, with trifling exceptions, would have been included in the specifications if the Board had not built the hospital in such a hurry.

It was utterly impossible for any public body or committee to watch the details of such an important work like this as it progressed. They must trust to their officers.

The Board should be protected by a clause in the contract to the effect that no extra would be paid for unless countersigned by the clerk, who, of course, would not act without authority. The architect should not have the power of spending the money of the ratepayers without the sanction of those who represented them. In this case the architect "very nearly" had *carte blanche*.

As to the cost of the foundations running up from 5,000*l.* to 19,000*l.*, even if the committee had gone over the site every time they were there, they could not have realised what the ultimate cost would be. Although 19,000*l.* seemed a large figure, it must be remembered that enormous quantities of concrete were used, and some of the blocks were 30 feet by 20 feet.

The hospital as completed was a first-class one, but he agreed that they had touched the "high-water mark" of expenditure on such a building.

Mr. Brown followed in a like strain, urging that the large expenditure was due to the nature of the site and the short space of time allowed for the preparation of the plans.

This practically closed the inquiry, and the Inspector intimated that he would report in due course to the Local Government Board.

VENTILATION AND WARMING.

(Continued from last week.)

IF side openings are satisfactory inlets they may be equally satisfactory outlets, and it is desirable that natural ventilation should be arranged so that it may be reversible—that is, so that the inlets and outlets may interchange their functions without diminishing their efficiency. In fact, attempts to differentiate them often lead to disappointment. The arrangement suggested for dormitories is intended to carry out this view. At the same time it should be remembered that in dealing with dormitories no special account has been taken of the vitiation of air by artificial lighting. As throughout the schools gas is the illuminant used the effect upon the air is serious indeed when full illumination is employed. In the dormitories there is so little gas in any case kept burning through the night that its effect may be overlooked, but in schools if light is required it is full lighting that is wanted. In that case the shafts leading from the ceiling are of great importance and value in leading away the gas fumes.

In schools ventilated by cross ventilation it is desirable to concentrate the heating under the windows where the air comes in. The Hanwell School block seemed to me to afford a successful instance of this plan. The arrangement may involve a loss of heat, and therefore require a greater length of pipe than would be required if it were carried round in uniform rows, but the effect upon the ventilation is worth the sacrifice of heat.

If radiators, whether for steam or hot water, be employed, it is essential that the surfaces exposed to the air should be readily cleaned, and that hot-water pipes and steam pipes should not so block the air bricks or other openings for ventilation that they cannot be cleaned with facility.

Application to Buildings Inspected.

In applying these principles and considerations to the actual cases of rooms which came under my notice it was clear that the requirements for efficient ventilation and warming were beyond what the arrangements of the schoolrooms could be expected to supply.

There is, I think, no doubt that the arrangements for warming and ventilating the schoolrooms require some modification in order to bring them up to a satisfactory state of efficiency. The arrangement suggested for dormitories would afford some improvement, but the amount of heating power would have to be larger, and the amount of open window required would be so large in order to deliver the requisite amount of air that difficulties would probably arise in consequence, and I therefore hesitate to recommend it for the purpose. It seems to me that the mechanical system of ventilation has such great advantages for school purposes that the best way of dealing with the ventilation and warming of the schools would be to supply them with warmed air by means of a fan driven either by gas or water-power; the existing floor ventilators, air-bricks, Tobins and other contrivances would serve very well to let the air out. So many of the schools pump their own water that it is quite likley it might prove most economical and convenient to drive the fan by water-power. In any case the fan need only be driven during school hours, when any necessary attention can easily be obtained. If this were done I should suggest that the existing arrangements for warming, excepting closed stoves, should be continued, in order that an active local circulation of air should be maintained, and the temperature of the air mechanically delivered should be 55 deg. to 57 deg., a few degrees below that at which the rooms should be maintained. The air should be sent in from trunks carried along the side walls below the level of gas burners, and the issuing air should be directed outwards and sufficiently upwards to avoid blowing directly upon the occupants of the rooms.

I need not again repeat the remarks as to the necessity for cleaning of perforated skirting and other air ducts as well as steam or water pipes.

Recommendations.—1. That instructions be issued as to the temperature to be maintained and as to the means of regulat-

ing the appliances for warming and ventilation of the schoolrooms and classrooms.

2. That records of the temperature be obtained from time to time and kept for inspection (see Recommendation 3 for Dining-halls).

3. That the ventilation of the schoolrooms and classrooms be supplemented by apparatus for supplying warmed air mechanically at the rate of 1,500 cubic feet per hour per child during school hours, at a temperature of from 55 deg. to 57 deg., the existing openings for ventilation being retained as outlets for the air.

4. That provision be made for regularly cleaning the air ducts.

Section VI.—Workshops and Workrooms.

I have little to remark about workshops. These are generally occupied by few boys, so that the allowance of cubic space is large. The tailors' shops seemed to require a little consideration. They and the shoemakers' shops are most frequented by the boys. The tailors congregate on a platform close to the windows for the sake of the light. It is a cold position, and naturally exposed to draughts from open windows. They generally use a tailors' stove for warming the room, which is closed, and therefore does not help much with the ventilation. To make sitting in the window tolerable, the room has to be overwarmed and ventilation is more or less suppressed, though the smell of the clothing seems to invite ventilation more urgently than in other rooms. It will be noticed that it is the tailors' shops that are generally marked as warm or close.

The difficulty might be met by having hot-water pipes under the platform near the windows, making ample openings for the supply of fresh air to the space under the platform, and taking the warmed fresh air from a series of holes in the platform close to the windows. Such an arrangement would require the pipes to be regularly cleaned.

The shoemakers' shops, according to my experience, keep their atmosphere in a more satisfactory condition. In all workshops there should be windows on both sides for cross ventilation, with a special view to ventilation in the summer months.

In the laundries the only general point I have noticed is that an ironing stove is usually unprovided with special ventilation. The considerable masses of red-hot iron are not healthy in a closed room, and if they were situated so that the heated air rising from them should assist the ventilation, and not be distributed over the room, it would be advantageous. I think this might easily be arranged when the stove is placed in a recess. A pipe carried up for some distance from a canopy over the ironing stove, through the ceiling of the recess, terminating in a cowl, would be an efficient aid to the ventilation of the room.

Some of the needle-rooms were found to be close. Probably a more judicious use of the windows would have made the rooms fresh enough without discomfort.

I do not desire to make any specific recommendations with regard to workshops. It may be sufficient to call the attention of the authorities of the schools to the necessity for the proper ventilation of the workshops, and of the tailors' shops and needle-rooms in particular, so that any defect may, if possible, be remedied by the more active use of the appliances already provided.

Section VII.—Probation Wards.

The wards of the probation blocks are comparatively small, and may therefore be regarded as coming under the considerations applicable to small dormitories in general. They are, as a rule, fully provided with windows on both sides, so that cross ventilation can be effectively carried out. It is usual to provide one dormitory and one day-room for boys, and another dormitory and day-room of about the same size for girls and infants. The day-rooms are very nearly as large, in some cases quite as large, as the dormitories, so that the allowance of day-room accommodation is much more ample than in the main buildings.

A characteristic feature of all these probation wards is that the number of occupants of the dormitories is liable to variation, so that many of the beds are sometimes unoccupied. Ventilation is, however, none the less necessary when the numbers are somewhat smaller than the maximum. It wants, perhaps, more skilful management than in those wards where the variation in the numbers of occupants does not make an addition to the difficulties presented by the variations of weather, and the ventilation is liable, as in the case of the dormitories, to be too cold under present circumstances.

The variation in the number of occupants is a reason, in addition to those given under the heading of dormitories, for retaining the system of cross ventilation, with modifications to render it more efficient. The modifications suggested for dormitories would be equally applicable in the case of the dormitories and day-rooms of the probation blocks, but considering the comparatively small size of the rooms and the small average number of occupants to be provided for, the system based on supplying fresh air behind the open fires might be adopted as an alternative, provided that arrangements can be made for having the fires kept burning during the night in very cold weather. Unless the fire can be kept burning all night a grate with warm-air supply is apt to be worse than having no artificial warming, for at the commencement of the night there is considerable warmth, which gradually diminishes as the night advances, and is least in the early morning, when most is wanted. With the object in view of keeping the fire burning for a long time without attention, it is desirable that the grates should have close-fitting fronts and ashpans for rendering the combustion slow, and I should wish further to suggest that the supply of air to the back of the stove be much more ample than is usually allowed, and that the flue supplying the air should be arranged so that it can be swept. Also it is desirable that the supply of air be capable of regulation by a door worked from the inside.

It appears to me that in cases such as these we are now considering, where a large quantity of only moderately warmed air is required, it would be practical and convenient to use an open iron stove lined with fireclay, such as usually stands out a foot or more from the wall, and has a horizontal chimney conducting to a vertical flue in the wall; to place the stove on the hearth-stone, leaving about a foot of space between it and the back of the fireplace opening, and make good its chimney with the brick flue. The stove could then be surrounded above and on two sides with iron or other covers (that could be made removable for the purpose of cleaning), leaving a vertical opening of perforated iron in the front above the stove. The arrangement practically amounts to constructing a recess somewhat deeper and broader than that in which an ordinary fire-grate is set, and placing in it a stove with an open front, and covering the space intervening between the stove and the sides of the recess with iron plates, the mantel being of perforated iron. The space behind the stove should have an ample opening, 18 inches by 9 inches, to the outside air. It should be capable of being closed by a door worked by a screw with long handle from the inside of the room. There would, I think, be no danger of smoke fouling the air supply. The passage of the smoke into the air flue is generally caused by the opening for warm air into the room being too high, and the opening to the outside air not being sufficiently large. The little vertical flue intended to deliver the air becomes filled with very hot air, and draws actively, not only from the outside supply, but from any other available opening. A chink between the fire or smoke flue and the fresh air flue becomes one of its feeders. If leakage of smoke is to be avoided, the air flues should be so arranged as to produce no "head" in themselves.

Recommendation as to Probation Wards.

That provision be made for furnishing the dormitories and day-rooms with stoves having ample flues for supplying warmed air to the room in those cases in which the heating is entirely dependent upon open fires.

Section VIII.—Infirmaries.

Allowance of Cubic Space in Wards.

The amount of cubic space per bed varies between 845 cubic feet at Leytonstone and 335 cubic feet at Sutton. Under these circumstances it is not possible to regard the problems of warming and ventilating the several wards as belonging to a single type. If we accept 850 cubic feet per bed as the normal allowance of cubic space for sick children, and provide for the ventilation and warming accordingly, the wards will obviously be inadequately provided for if 170 beds are subsequently crowded into the space assigned to 67.

On reference to the report of the committee on cubic space in metropolitan workhouses (1867) it appears that two general kinds of infirmary wards were considered, besides certain special kinds, with which we are not at present concerned. They were (1) wards occupied by day as well as by night, for which the minimum allowance of cubic space was set at 850 cubic feet per bed, and (2) wards occupied by night and partially by day by the "chronic" and infirm; the patients occupying these wards were to have the use of a dayroom, and on that understanding a minimum allowance of 500 cubic feet per bed was prescribed for them. These two kinds of ward have their counterparts in the infirmaries of the Poor Law schools, and in consequence two cases, widely separate so far as ventilation is concerned, present themselves, namely, first, the case in which there may be only twelve patients in a ward of 10,000 cubic feet (850 cubic feet per bed), and, secondly, the case in which there may be twenty patients in the same cubic space (500 cubic feet per bed).

A third case must also be contemplated, where the cubic space per bed according to the table is only 335 cubic feet. This is probably to be accounted for by the fact that children who do not require special nursing, and who cannot be exactly classed as infirmary patients, are occasionally segregated for observation by the medical officer. They do not require sub-

stantially more cubic space than the corresponding number of children in the main school buildings, and their requirements as regards warming and ventilation are such as have been already considered in dealing with the rooms of the main building. But since any ward of an infirmary may upon occasion be used for this third purpose, the ward of 10,000 cubic feet must be regarded not only from the point of view of its occupation by twelve patients or by twenty patients, as the case may be, but also from the point of view of its being required to accommodate on occasions as many as thirty children, who are merely under observation. It is clear that if a ward may be used for twelve, twenty or thirty inmates, according to circumstances, the arrangements for warming and ventilation require to be correspondingly elastic.

Want of Knowledge of the Use and Capacities of the Apparatus Provided.

One of the most striking points elicited during the inspection was the want of knowledge of the use and capacities of the apparatus displayed by those in charge of the wards.

Somewhat similar remarks apply in the case of many of the grates to which a supply of fresh air has been provided. Those in charge were unaware of its existence. In the course of our visits a large number of previously unknown air channels have been identified (chiefly by the aid of pastilles), and many stoves and radiators have been discovered to have parts removable to facilitate cleaning, that had, up to that time, been supposed to be fixtures of the most permanent description. The method of setting the valves of the Tobin tubes that had been provided was not always understood, and the means of communication between the apparatus inside and the external air had in some cases not even been considered by those from whom I happened to make inquiry.

In making these remarks I have no wish to reflect adversely upon the members of the staff of the infirmaries, or to imply that they are exceptionally ignorant about the working of appliances for ventilation; the matter is general throughout the schools, and is by no means confined to them. The habit of supposing that the ventilation was provided for when the building was erected and need not further be considered is exceedingly widespread. In my experience there are very few persons who know where their ventilators lead to or where their air-inlets lead from; it was to me, therefore, no matter of surprise that the arrangements at the infirmaries should be so little understood. The lack of knowledge was the more conspicuous there than elsewhere because the contrivances in use, or intended for use, in the infirmaries are more numerous and more intricate than those in other parts of the schools, but I only now refer to the matter in order to urge the desirability of having information as to the provision made for warming and ventilating definitely set forth for the use of those in charge, especially where, as in the schools, the personnel of the staff is liable to frequent change.

Special Requirements for Ventilating and Warming Infirmary Wards.

The consideration of the ventilation and warming of the wards of an infirmary presents the following special points:—

1. There should be greater elasticity than is required in dealing exclusively with warming and ventilation for healthy children. The heating appliances should be sufficient to maintain the temperature at from 60 degrees to 65 degrees, even in very cold weather. The amount of air supplied for each inmate should be greater than that allowed for healthy children in a dormitory, and may be put provisionally at 4,000 cubic feet per head per hour for wards occupied by either class of patients referred to above, and at 3,000 cubic feet per head per hour for children isolated for observation.

2. Draughts must be more scrupulously avoided, partly because patients are more sensitive than healthy children, and partly because the larger difference of temperature between the internal and external air makes the draughts much more markedly unpleasant or injurious if they exist at all.

3. Any ward may be occupied day and night; there will thus be no opportunity for thorough airing by opening the windows; the ward must therefore be capable of being fully and continuously warmed and ventilated.

4. Some considerable amount of artificial light must be employed for much longer periods than is necessary in the case of dormitories for healthy children. The artificial light exclusively used in the wards of the school infirmaries is gas.

As regards the allowance of fresh air per inmate per hour, it may be well to add a remark in explanation of the figure assigned. In dealing with dormitories for healthy children, I took 3,000 cubic feet per hour as a liberal allowance for one child. The figure is arrived at by considering the amount of air required to dilute the carbonic acid gas, expired with the breath, to such an extent that the amount when so diluted shall not exceed by more than two parts by volume in 10,000 that to be found in the external air; but it must be understood that it is not the carbonic acid gas in itself that is injurious to health if persistently respired when present in the air to the extent of more than some six parts in 10,000; it is the organic poison which is associated with the carbonic acid in the expired air, and it is only by assuming that the amount of organic poison is proportional to the amount of carbonic acid that the percentage of the latter can be used numerically as an index of the unwholesomeness of the air for respiratory purposes. The assumption may be sufficiently nearly justified as applied on the average in the case of healthy persons, but the amount of organic poison associated with a given amount of carbonic acid must be taken as increased, probably largely increased, in cases of disease. What additional allowance of air should be made for infirmaries on this account has, so far as I know, never been satisfactorily determined. The suggestion of 4,000 instead of 3,000 cubic feet per hour is, according to Dr. Notter (Stevenson & Murphy's "Hygiene," vol. i. p. 20), derived from observations of De Chaumont. It may be acknowledged to be a very rough estimate, and to be subject to correction as the knowledge of the subject becomes more complete. In the case of infectious diseases a much larger allowance of air as of cubic space ought doubtless to be provided, but I am not aware of any specification of the appropriate amount that is based upon such definite data as the original calculation of the 3,000 cubic feet.

(*To be concluded.*)

GENERAL.

A Bronze Statue of Robert Burns, by Mr. D. W. Stevenson, R.S.A., was unveiled in Leith on Saturday. The money for the work was raised by the Leith Burns Club.

The Royal Institute of Painters in Water Colours have elected the following members:—Messrs. Byam Shaw, Robert Meyerheim, Henry Ryland and J. Shaw Crompton.

The Statue of the Rev. Dr. Martineau, by Mr. H. P. Hope-Pinker, which was exhibited this year at the Royal Academy, was unveiled in Manchester College, Oxford, on Tuesday.

The London County Council have agreed to contribute £15,000 towards the outlay of £45,000 required for widening Lothbury to 50 feet.

A Pastel Society is now in course of formation. Mr. Watts, R.A., has accepted the honorary presidency. Messrs. Abbey, R.A., Boughton, R.A., Sir W. B. Richmond, R.A., Walter Crane, W. Rothenstein, C. H. Shannon and Edward Stott are members of the Council. Mr. Melton Fisher is the hon. treasurer and Miss Marion Gemmell the hon. secretary. The first exhibition will probably be held in the galleries of the Royal Institute in February next.

M. Bourgeois, the French Minister of Public Instruction and Fine Arts, has ordered the official inauguration of the new Opéra Comique, Paris, to take place on December 1.

The Improvements Committee of the London County Council have come to the conclusion that they cannot see their way to recommend the Council to adopt the suggestion made by the St. Giles's Board of Works, for the widening of High Holborn from Southampton Row to Southampton Street.

A Machine for testing the wearing power of various kinds of rock and stone, which has been in use for some time by the French Government, has been set up by the Maryland State Geological Survey. It is composed of duplicate revolving cylinders which are hollow, and allow a good-sized piece of stone to be placed inside of each. The rod of the machine is attached to the motor, and the cylinders revolve rapidly several thousand times. They are opened then, and the fine material that has been ground off is gathered up after the stones have been washed and is weighed. In this way the experience of years can be gathered in a few hours. Calculations can be made from the result to just what extent the stones experimented with would wear if used in public buildings or for paving.

Mr. C. McArthur Butler, Member, of Boscombe, has been appointed by the Council of the Society of Architects to be the secretary of the Society in the place of the late Mr. Montagu Baldwin.

The Directors of the London and Lancashire Fire Insurance Company have declared an interim dividend of 4*s.* per share (being at the same rate as the last interim dividend), payable on November 2, 1898.

Messrs. Cassell's new venture, *The New Penny Magazine*, is an excellent example of what can be done nowadays in the direction of cheap literature. It contains no less than sixty pages of well-written, well-printed and abundantly illustrated matter, and as this is of an interesting as well as an instructive and improving nature, there is no doubt the new "Mag." will be warmly welcomed in many households throughout the kingdom.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

The opening of the new Crown Theatre, Peckham, has been definitely fixed for the last day of the present month. The theatre, which is a fine brick building in the High Street, will be lighted with electric light throughout, and will have seating accommodation for 4,000 persons.

BUILDING AND BUILDERS.

In the Edinburgh Sheriff Court on the 13th inst., before Sheriff Rutherfurd and a jury, an inquiry was held into the circumstances attending the death of Edward Hanlon, mason's labourer, 9 Ashley Buildings, High Street, lately in the employment of Messrs. Melrose & Thomson, builders, Jameson Place, Leith. The evidence showed that deceased, who was engaged on the 3rd of this month upon a house in the course of erection in Montagu Terrace, was filling a bucket with lime on the ground inside the building. A fellow-workman was in the act of descending a ladder from the top storey carrying a piece of wood, when the latter slipped from his hands and, after striking one or two projections in its progress, fell on Hanlon from a distance of fully 40 feet. The unfortunate man was conveyed to the Royal Infirmary where he succumbed to his injuries about an hour after admission, death being due to fracture of the skull. The jury returned a verdict in accordance with the evidence.

The memorial-stone of a new Free church at Carnock, Fifeshire, was laid on the 12th inst. by the Earl of Moray, in presence of a large assemblage. The church is to provide accommodation for 300 worshippers, and the cost is estimated at about 1,100*l.*

The Lord Mayor of Liverpool, who was accompanied by the Lady Mayoress, laid on the 13th inst. the foundation-stone of the new out-department in connection with the Liverpool Stanley Hospital in Easby Road, which is to be erected at a cost of 2,500*l.*

The foundation-stone of the church of St. Stephen, Bexhill, was laid on the 15th inst. by the Misses Walker, daughters of the donor, Mr. J. Lambert-Walker, who is devoting 10,000*l.* towards the building and endowing the edifice.

The work of excavating for the foundation of the new volunteer drill-hall for Ormskirk is in progress. The building, the site for which has been given by Mr. James Eastham, is expected to cost between 2,000*l.* and 3,000*l.*, and will not merely provide facilities for military training, but for recreation and mental improvement.

A labourer named Pindell, aged eighteen, met with a shocking death last week. He was working on a scaffold at the Vestry Hall, Putney, when a plank on which he was standing gave way, precipitating him into the roadway head foremost, and dashing his brains out. When picked up he was dead, and his body was removed to a mortuary.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

While employed in the erection of a new chimney in connection with the Leeds new abattoir works, New York Street, last Friday afternoon, a bricklayer's labourer named Edward Clarke was killed, and a bricklayer's apprentice, John Greenwood, seriously injured. The chimney is 76 feet high and the men fell inside, a distance of 70 feet. They had probably overbalanced themselves, as the scaffolding remains intact.

At the monthly meeting of the Morecambe School Board a letter was read from the Education Department sanctioning the purchase by the Board of close upon 6,000 yards of land as a site for new schools, and the abandonment of the existing schools. It was decided to ask the consent of the Local Government Board to borrow 5,650*l.* to cover the cost of site and expenses.

The annual dinner of the Northampton Master Builders' Association was held in the assembly-room of the George Hotel, Northampton, last week. Mr. E. D. Sharman (the president of the Association) occupied the chair, supported by the mayor of Northampton (Councillor W. P. Hannen), Alderman George Norman, J.P., Councillor Henry Martin, J.P., Councillor Henry Green, Mr. F. J. Airs (hon. sec.), and Mr. F. H. Mardlin. The vice-chair was occupied by Mr. G. Harris, and the company numbered about a hundred.

The large timber yard and saw mills belonging to Mr. J. Gretnin, builder, Shrewsbury, were destroyed by fire on the morning of the 13th inst., and damage caused to the amount of a thousand pounds. A Wesleyan chapel, a paint warehouse and offices and workshops adjoining had narrow escapes. Troops were called out, and rendered useful help to the firemen. The fire, which was caused by a cinder from an engine falling among some shavings, was extinguished in an hour.

Councillor Green Hirst (chairman of the fire brigade sub-committee of the Leeds City Council) has had an interview with the waterworks committee with reference to the building of a new police-station at the corner of Reservoir Street in place of the present small and inconvenient structure. In connection with the new police station it is intended to erect a branch library and a tramway waiting-room, and Mr. Hirst's object in meeting the waterworks committee was to ask for the necessary land which will be required for the purpose. The committee agreed to the request.

In Liverpool on Monday an inquest was held on the body of Thomas Whittaker, a steeplejack. He had finished repairing a lofty chimney and was removing the ladders when he slipped and fell a distance of 40 feet, sustaining injuries which terminated fatally the same night. The deceased's wife said he was a sober man, but always took a drop when going to a job. The foreman of the jury remarked that it was customary with steeplejacks to do so. Several witnesses deposed that deceased was drunk when he ascended the chimney. The jury found that death was the result of an accident, but that deceased was drunk at the time, and should have been prevented making the ascent.

The north-west gable of the west front of the Peterborough Cathedral has been completed in a most satisfactory manner in accordance with specifications got out as far back as 1896, the estimated cost being 8,659*l.* 5*s.* 4*d.* The centres of the south-west arch of the west front are in position, and the work necessary to remedy the dangerous settlement of the north-east angle of the eastern chapel is approaching completion. The cost of these works has exhausted the funds at the disposal of the committee. The next most important work to be undertaken at the west front is the south-west gable, which it is proposed to treat in the same manner as the north-west gable, so far as may be found necessary.

The famous regatta town of Henley-on-Thames is destined to important developments in the near future. The extensive property known as the Bolney Estate stretches from Henley to Shiplake and Harpsden, with an area of upwards of 1,700 acres, and including the residences of Bolney Court and Harpsden Court has been sold to a London syndicate by Messrs. Simmons & Sons for 50,000*l.* This transaction is likely to have a great effect upon the development of building property in the neighbourhood of Henley, all the land on the north side of the town being practically locked up. The Bolney Estate possesses a frontage to the Thames extending from Marsh Lock to beyond Shiplake station, the Reading and Henley Road intersecting the estate, which is well timbered.

A new adult school has been opened recently at Hockley. The total cost of the school and mission is 4,150*l.* The large hall is a tastefully designed edifice of brick and terra-cotta and has a frontage to Farm Street. The main corridor leads directly from the street into the central hall, which is a compact and spacious room, having a length of 63 feet and a width of 40 feet, capable of seating upwards of 500 persons. The rostrum is fixed at the far end of the hall, and on either side are doors leading into another corridor running transversely. Behind this four classrooms are provided, each

H. MUNZING. 199 UPPER THAMES ST., LONDON, E.C.

capable of accommodating fifty persons. Two of these are so arranged as to be used for retiring-rooms, while behind the whole, and abutting almost on Hockley Brook, is another large room, 46 feet by 20 feet. This chamber is to be devoted to purposes of recreation, and will be utilised each evening by the members of the social club. The buildings have been erected by Mr. T. Elvins, of Handsworth.

The new Union Club buildings, which have been erected at the north end of Union Terrace, Aberdeen, for the social and political purposes of the Unionist party in the city, were opened on Tuesday by the Marquis of Lorne. The new club, which is of handsome design by Mr. A. H. L. Mackinnon, architect, commands a view across Union Terrace on the one hand, and Skene Terrace and North Silver Street on the other. It is three storeys, the ground floor of the front being occupied by three large shops, while the floors above are devoted exclusively to the uses of the club. The central portion of the elevation to the level of the base of the flagstaff rises to a height of 64 feet, and terminates in a circular window flanked by pilasters and surmounted by an obelisk. A rich projecting cornice, with balusters above, gives an effective finish to the rest of the elevation. To the club-rooms access is obtained by the vestibules, the one in Union Terrace and the other in Skene Terrace. Each of the entrance doors has an arched head, and is flanked by pilasters, with obelisks above. The length of the hall in which public meetings will be held is about 75 feet, with a breadth of 42 feet. In the south end is a small gallery, which will accommodate about 80 persons. On the same floor there is a commodious kitchen and buffet, from which there is a lift to the refreshment-room above. The first floor contains three well-lighted smoking, reading and refreshment-rooms, all looking to the front, while on the second floor are committee and recreation-rooms, with caretaker's apartments. The billiard-room has been fitted with six tables. Throughout the building is to be heated with steam pipes as well as by open fireplaces, and the electric light will be fitted up. The total cost of the club is between 9,000*l.* and 10,000*l.*, exclusive of furnishings.

The excavators working on the new dock at Llanelly have struck a vein of coal nearly 3 feet thick. The coal is highly bituminous, and of excellent quality. It cut easily and several truck-loads were obtained.

TRADE NOTES.

A large clock has just been erected in the parish church of Owslebury, near Winchester, by John Smith & Sons, Midland Clock Works, Derby. It is fitted with all the latest improvements, and is guaranteed to keep time with great accuracy.

The new cottage hospital for the Barnes and Mortlake District Council is being warmed and ventilated by means of Shorland's double-fronted patent Manchester stoves with descending smoke flues.

ELECTRIC NOTES.

At the meeting of the Dorking Rural District Council on the 13th inst., Mr. H. Lee Steere presiding, the surveyor reported as to the electric lighting of the towns of a similar size to Dorking in which works were in operation or about to be constructed, and he was directed to obtain further detailed information.

At the meeting of the Driffield Urban District Council a letter was read from Mr. W. H. Jennings, solicitor, Driffield, stating that he had been instructed by a company to give the Council notice of their intention to apply for a Provisional Order authorising them to construct works and supply the town with the electric light. In a subsequent letter Mr. Jennings said he found that his letter to the Board was too late for this year, the last day for serving such notice on local authorities being July 1. However, the notice would be renewed next year. There was no comment on the matter, but it is unlikely the Council will view the matter with favour, seeing they last year purchased the gasworks at a stiff figure. Doubt is expressed whether the town is sufficiently large to make such a company remunerative.

At the last meeting of Marylebone Vestry there was a considerable discussion on the recommendations of the electric-

lighting committee that formal notice be given on or before November 1 to the Metropolitan Electric Supply Company, Limited, of the Vestry's intention to proceed for a Provisional Order for the public and private or public or private lighting of the parish by electricity. Mr. Brooke Hitchings, C.C., in moving the recommendations, thought that notwithstanding the Vestry having failed to obtain Parliamentary powers conferring the Provisional Order granted by the Board of Trade last year, yet it should go on and endeavour again to obtain such powers. Sir E. Galsworthy and Mr. T. White, L.C.C., both opposed, and thought that it would be well that they should wait another year. The recommendation, on the vote being taken, was unanimously agreed to.

THE Ayr electricity lighting works have now been in operation for two years, and extensions on a large scale have recently been made, and are partly in use. The original installation was for 225 kilowatts, giving a total light equal to 7,650 8 candle-power lamps, and the works cost 25,000*l.* The additional plant, which has been laid down at a further cost of 15,000*l.*, nearly trebles the means of production, the amount of light the combined plant is capable of producing being equal to 20,000 8 candle-power lamps. The producing capacity of the works is now such that they are likely to be sufficient to meet the demand for a number of years. Several miles of street have been lighted with arc lamps, and many of the shops are lighted both by arc lamps and incandescent lamps, and many private houses are also lighted on the incandescent system, while all new houses where the cables are available are being fitted up solely with the electric light. The length of cable laid down already extends to eight miles, and the Corporation have entered into a contract to light the harbour and dock with fifteen arc lamps. This will bring up the total arc lamps within the burgh to 105, and it is intended to further increase the number, one of the most important extensions being to the esplanade along the seashore, on which it is proposed to fit up eighteen arc lamps. When the system is fully in operation Ayr will probably be the best lighted town in Scotland.

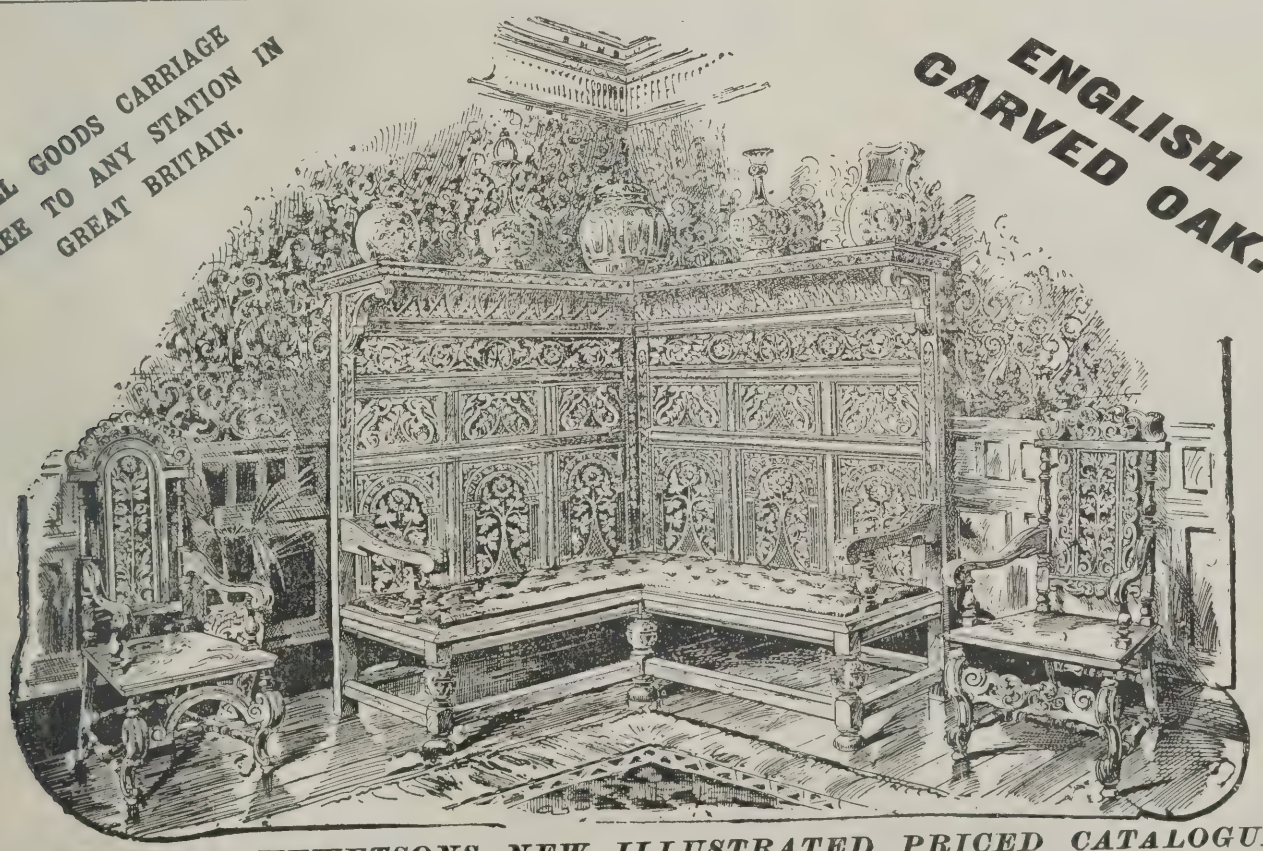
A LARGE and important power-station is now in course of erection on an extensive plot of ground at Ringsend, Dublin, for the Dublin Electric Tramways Company. The whole of the buildings will be of steel, which is being supplied in immense quantities by Messrs. Ketter & Conoly, of Pittsburg, Pennsylvania, United States, and the works, which were only commenced in March last, are advancing satisfactorily to completion. Two steel chimneys, of noticeable symmetry, and each 200 feet high, form an imposing feature of the works, and these were erected in the short space of seven weeks. The brick lining of these monster chimneys forms a 10-feet circle. The base is 28 feet high, and is built on concrete blocks. The boiler-house and engine-house will be on a large scale, the steel columns of the superstructure being more than 60 feet high, while to the apex of the columns the height is 70 feet. The boiler-room will measure 83 feet from the lowest floor to the apex. As regards the main building it will have a width of 80 feet inside, with a steel roof in a single span and a length of 200 feet. Large quantities of Ruabon and Belfast bricks are on the ground, these being used in various ways. The building contractors are Messrs. H. & J. Martin, of Dublin and Belfast, and the clerk of works is Mr. D. P. Murphy.

VARIETIES.

THE Wesleyan chapel at Welburn was reopened on Tuesday last, after undergoing complete renovation.

AN excursion meeting of the Northern Architectural Association will be held to-morrow (October 22). The President will conduct the party over Messrs. Robinson's new premises, Clavering Place, Newcastle.

THE new central block of college buildings at the Welsh University, Aberystwyth, erected at a cost of 15,000*l.*, is to be opened on Wednesday, the 26th inst., by Sir William V. Harcourt, M.P.



ON Saturday afternoon, in the presence of a large company, the cottage homes which have been erected at Mill Hill, near Hendon, in connection with the Linen and Woollen Drapers' Institution, were opened. They occupy a site of four acres and have been built at a cost of nearly 13,000*l.*

THE cutting of the first sod preliminary to the construction of a new reservoir to supplement the Harrogate water supply took place on the 17th inst. The site is at Scargill, seven miles from the borough, and the reservoir is expected to be completed in three years.

TUDOR HOUSE, Hampstead, which overlooks the ponds on the brow of the Heath, is being adapted by its purchaser, the Baroness Hirsch, for the purposes of a convalescent home for the Jewish community. The dining-room at Tudor House is modelled on that at Hatfield House.

Estate Department.—Auctions and Private Sales, Valuations, Lettings, Surveys, Repairs, and Decorations

THE Queen has had plans prepared for a number of dainty little tea-houses which are to be erected during the coming winter in the grounds and on the more extended drives about Balmoral. Spots with lovely views of the mountains and of the river Dee have been chosen by the Queen herself, and on these they will be built. The cottages will be finished in May.

THE Conference of Municipal officers already announced to be held on Monday, the 31st inst., at Sion College, Victoria Embankment, London, E.C., will be presided over by Mr. C. William Tagg, vestry clerk of Camberwell, and amongst those who have signified their intention of being present are Sir John Blundell Maple, M.P., Major P. H. Dalbiac, M.P., Mr. John Lowles, M.P., and other influential gentlemen.

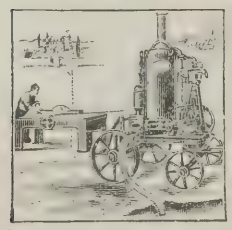
A FIRE broke out at four o'clock on Tuesday morning at the extensive timber yard of Messrs. Laverack & Goddard, Hull, and a great part of the timber and premises was destroyed. The timber yard is surrounded by tenement property, which at one time was in danger, but the police effectively coped with the flames, although a furious wind made their efforts difficult. Several of the mills were destroyed, and the damage is estimated at 14,000*l.*

THE inaugural meeting in connection with the Bible Training Institute for Scotland was held on the 18th inst. in the newly-completed building in Bothwell Street, Glasgow. The building has been erected from plans by Mr. R. A. Bryden, Bothwell Street, and is designed to harmonise with the Christian Institute, which it adjoins. The total outlay, including the cost of the site and of the furniture, which has been supplied by Messrs. A. Gardner & Son, Jamaica Street, is about 50,000*l.*

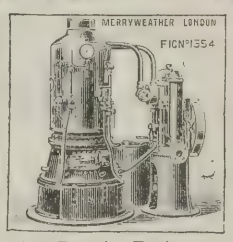
THE building of a new bridge across the Thames at Kew seems likely to be delayed. A number of tenders were opened by the joint committee of the Surrey and Middlesex County Councils this week, when it was found that the lowest in amount was about 50,000*l.* beyond the estimate given by Sir James Wolfe Barry, upon which the Act of Parliament was obtained. It will now be necessary to persuade the County Councils to agree to the additional expenditure, and then to obtain further Parliamentary powers.

THE adoption of steam fire-engines in country towns is rapidly increasing, the need for more efficient protection than that provided by the manual-worked engines which have hitherto done duty being recognised by the new District and Parish Councils. The steam fire-engine drills at Blenheim Park and the securing of two challenge shields by the Leyton brigade with Merryweathers' new patent "Greenwich gem" engine have naturally attracted considerable attention, and the result has been that this type, which has the unique advantage that it can be stoked and run entirely by one man, has been adopted by a number of towns. Amongst these may be mentioned Hull, Wolverhampton, Blackpool, Handsworth, Barnes and Esher, while several foreign fire brigades have ordered similar engines.

THE new church of St. John the Evangelist, Wortley-de-Leeds, was consecrated on the 15th inst. by the Lord Bishop of Ripon. Built of stone, the new edifice accommodates about 750 people. There has been no extravagant expenditure and ornamentation. The interior, however, is by no means unattractive. It is much loftier than the old church which it supersedes. The roof is open timbered. Light is admitted by leaded windows filled with tinted cathedral glass. The original designs were prepared by Mr. Swinden Barber, of Halifax. The work, however, has been carried out under the supervision of another Halifax architect, Mr. T. H. Farrer. About 6,500*l.* has already been expended on the church, and the tower will be proceeded with when the necessary funds come to hand.

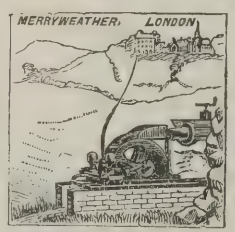


THE opening of the Edinburgh Constitutional Club took place in the lecture hall on Friday last. The new premises, which are situated in Bourtree Place, have been erected at a cost of between 3,000*l.* and 4,000*l.*, from plans by Mr. James P. Alison, Hawick. They are of handsome design and commodious, containing reading-room, lecture-hall, a billiard-room with six tables, card-room and committee-room, all handsomely furnished.



ABBEY MANSIONS, WESTMINSTER.

THE summons against the owner of Abbey Mansions (North Block), instituted by the London County Council under the dangerous structure clauses of the London Building Act, again came before Mr. Marsham on Monday, to whom was presented the award of the arbitrator to whom matters in dispute had been referred.



Mr. Dalby, for the London County Council, said that the arbitrator, Mr. Clifton, had decided in their favour. He said that the building ought to be shored up—his worship would recollect that this was a great bone of contention—that the defective stonework should be taken out and replaced, and thirdly, that certain openings on the basement and ground

floors should be filled up solid. A great deal of the work had already been done, and he could not say that the award was not being loyally acted upon. The question now was who was to pay the heavy costs and expenses.

Mr. Pollock, for the owner (Mr. Pawley), said he did not mind paying his own costs, but, inasmuch as he denied the right of the Council to proceed under the Act, he refused to bear the expenses of the complainants.

After a long argument the question of costs was reserved until the decision of the superior Court on the earlier summons (heard last July) as to the building being vested in the Government.

SANITARY INSPECTORS' ASSOCIATION.

THE annual general meeting of this Association was held on Saturday evening at Carpenters' Hall, London Wall, Mr. T. G. Dee (chairman of the Council) presiding. The report stated that sixty-eight new members and four associates had been elected during the past year. The Council regretted that no opportunity occurred during the year for the introduction of their Superannuation Bill in Parliament. They had also to regret that the long-talked-of conjoint board of examiners had at last received definite constitution, and an association had been formed composed of three representatives of the Local Government Board, two of the Sanitary Institute, and one each of the National Health Society, the Plumbers' Company, the Carpenters' Company, the Incorporated Society of Medical Officers of Health, the Royal Institute of British Architects, the Society of Municipal and County Engineers and the Royal Institution of Public Health, who were applying to the Board of Trade for a right to become incorporated on the same lines as this Association. The Council had, in accordance with the terms of the advertisement which appeared in the *Times* on the 14th ult., sent a letter of objection to the Board of Trade, and had also written to each of the bodies having representatives on the new board asking them to give full consideration to the claims of this Association to due representation on such board. The Chairman moved the adoption of the report, which was seconded by Mr. M. Nair. After some discussion, in the course of which it was generally agreed that the Association, while proceeding with their own Superannuation Bill, should lend their support to the Metropolitan Officers' Superannuation Bill, the report was adopted. The financial statement was then submitted by Mr. Nurcombe, one of the auditors, who remarked that something would have to be done to increase the income or decrease the expenditure, otherwise they would soon be in a state of bankruptcy.

NATIONAL REGISTRATION OF PLUMBERS.

THE winter session of the plumbing classes conducted by the National Registration of Plumbers, in conjunction with the Perth School Board, was opened last Saturday night in the Science Room of the Perth Academy, by a lecture by Dr. John S. Lumsden. Mr. James Ramsay, chairman of the evening continuation classes committee, presided, and amongst those present were ex-Bailie M'Neil, Mr. R. H. Miller, solicitor, Mr. Ellison, technical instructor, and Mr. Wm. Watson.

The Chairman, in his opening remarks, said that he saw in this new departure an indication of the progress they were making in their appreciation of the value of science teaching, and especially of technical instruction.

After Dr. Lumsden had delivered his lecture Mr. Wm. Watson, in the course of a few observations, said that the practical classes had for four or five years been conducted with splendid results, and they now had the advantage of a teacher in the science subjects in the person of Dr. Lumsden.

The Chairman then presented the certificates gained last session by John Morton and David Welsh in the examination held under the graded syllabus of the Plumbers' Company.

A NEW AUTOMATIC GAS-LIGHTER.

DURING the past few days the King's Hall of the Holborn Restaurant has been devoted to the purposes of an exposition of the merits of the "Matchless Gas-lighter," which, as its name implies, effectually dispenses with the use of matches and its attendant danger and inconvenience in the lighting of gas, and, which is of perhaps greater importance, supersedes the bye-pass, which must certainly be regarded as an element of risk, especially when used in association with gasaliers of the telescopic kind, not a few explosions having occurred which were directly traceable to the escape of gas from fittings of this description having filled the upper part of the room, and reaching in time the lower level of the bye-pass with the inevitable and lamentable result of a serious "blow up."

The new lighter appears to possess the valuable qualities of simplicity, durability and adaptability. The fundamental principle is platinum wire heated by carburetted hydrogen, and

the effect is that immediately the gas is turned on either at the burner or the meter it ignites apparently spontaneously. The lighter is practically indestructible, as the portions susceptible to injury by heat are secluded from the action of the flame; but should any portion be at any time accidentally damaged it can be readily and inexpensively replaced, as all parts are interchangeable. It can without any difficulty be applied to any existing burner, whether of the old-fashioned kind or the more modern incandescent description.

NEW CATALOGUE.

We have received from Mr. William Cassels, of Kirkintilloch, a new catalogue of his patent "Clarifont" lavatories, which provide the luxury of washing in water which remains always pure. This desideratum is attained by providing an inner basin with a constant supply welling up from the bottom during the washing, and overflowing all round the rim, thus carrying off at once the soiled and soapy water. The inner basin being large enough to completely immerse the hands, as much water can be lifted from it as from any larger vessel, while the continuous supply keeps the basin always overflowing. The "Clarifont" lavatory is made in various qualities, and either single or in ranges. It is therefore adapted for use in private houses and in hospitals, hotels or factories, where numbers require to wash at the same time.

INSTITUTION OF CIVIL ENGINEERS.

The prize-list of the Institution of Civil Engineers for 1897-98 is as follows. The awards will be presented at the Institution on Tuesday, November 1, 1898, at 8 P.M. Telford medals and premiums: A. H. Preece (London) and H. C. Stanley (Brisbane, Queensland). Watt medals and premiums: H. L. Callendar, M.A., F.R.S. (London) and J. T. Nicolson (Montreal, Canada). George Stephenson medals and premiums: Whately Eliot (Plymouth), W. O. E. Meade-King (London) and W. P. Marshall (Birmingham). The Crampton prize: E. W. Anderson (Erith). Telford premiums: L. B. Atkinson (Cardiff), Henry Fowler (Horwich), W. L. Strange (Bombay), F. J. Waring, C.M.G. (London), D. W. Brunton (Denver, U.S.), Wilfred Airy, M.A. (London), E. M. Bryant, B.Sc. (Newcastle-on-Tyne), D. B. Butler (London) and H. V. Champion (Victoria). The James Forrest medal: W. L. Brown, M.Sc. (London). Miller prizes: C. E. Wolff, B.Sc. (Derby), A. D. Keigwin (Ashford), Harold Williams (Kingston), J. T. Morris (London), H. C. Adams (Birmingham), H. O. Eurich (Bradford), B. K. Adams (Colombo), A. B. E. Blackburn (Wednesbury), Thomas Carter (Newcastle), P. F. Story (Manchester), D. E. Lloyd-Davies (Bewdley) and Wilfred Hall, B.A. (Corbridge-on-Tyne).

MESSRS. CHUBB'S NEW WORKS.

Sir George Hayter Chubb laid, on the 10th inst., the foundation-stone of a new lock manufacturing works which are being erected at Wolverhampton for the firm of Messrs. Chubb & Son, of London. The occasion had the additional interest attached to it that it was also the eightieth anniversary of the founding of the business. The premises will be of a most substantial and durable character. Every precaution has been taken to secure a sound foundation, the Portland cement concrete for this purpose being in many parts carried to a depth of 12 feet below the ground level. The superstructure will be of brickwork with Darley Dale stone dressings, the steps, door sills and stairs being of Portland stone. Tipton bricks are used for the general work, with King's Stourbridge red brick facings to the main buildings; the interior of the vestibule, show-room and offices having a dado of Ruabon glazed bricks, with Stanley's buff brick facings above. The paving of the basement rooms will be of Val de Travers asphalte laid on concrete; the show-room and ground floor offices will be paved with Duffy's pitch-pine blocks; the floors of the workshops will be of deal, 3 inches thick. Every storey will be amply provided with washing and lavatory accommodation, and a large dining-hall or mess-room, with kitchen attached, will afford additional comfort to those employed. In all such details the object has been to render the premises as perfect and convenient as it is possible to make them. Fire-resisting materials are to be used wherever practicable, and hydrants and special exits, with external iron stairs from the upper floors, will be provided. The ventilation, warming and sanitary arrangements have been most carefully studied.

Mr. C. H. M. Mileham, of Lincoln's Inn Fields, is the architect, Mr. E. T. Beck, of Darlington Street, Wolverhampton, acting with him as local superintending architect. Mr. H. Gough, of Dudley Road, Wolverhampton, is the contractor for the building.

WORKING-CLASS DWELLINGS.

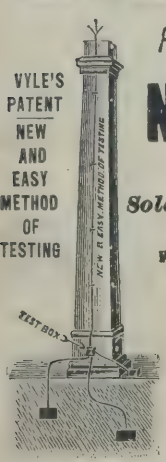
In connection with the Clare Market rehousing scheme now in progress, and with the proposed new street from Holborn to the Strand, in respect of which application is to be made to Parliament next session, the housing of the working classes and the improvements committee of the London County Council have had under consideration the question of obtaining sites for rehousing purposes in the immediate locality of the two schemes. Learning that land in the neighbourhood of Drury Lane was vacant, they entered into negotiations with the owner, the Duke of Bedford, with the result that he expressed his willingness to sell two sites in Drury Lane, and also a larger site fronting Herbrand Street, near Woburn Place. In their joint report to the Council upon the matter the committees strongly advise the acquisition of these three sites, which, if acquired, will be sufficient for the erection of buildings to accommodate 1,000 persons. By the formation of the new street about 3,030 persons will be displaced. The price asked for the three sites is 118,740*l.*, and, in the opinion of the committees, this is reasonable.

THE SMOKE NUISANCE IN LONDON.

The public control committee of the London County Council have just issued a report in which they give a brief account of the steps taken to put a stop to the serious nuisance from smoke in London. The report states that during the past few months a large number of infringements of the law were reported by the police and also by the Council's own officers, and these were at once communicated to the sanitary authorities for the districts concerned with a view to steps being taken for the suppression of the nuisance. Unfortunately some of the metropolitan police magistrates either dismissed the summonses taken by the sanitary authorities or gave lengthy periods within which the alterations necessary for abating the nuisance could be carried out. The result of those decisions was to discourage sanitary authorities from taking cases into Court, and the committee experienced considerable difficulty in many instances in inducing them to do so; in some few cases it became necessary for them to declare the sanitary authorities in default and to initiate proceedings provided for in the Act, but in none of them was it necessary actually to issue summonses as the nuisance was abated. At two or three premises, however, they regretted to find that quite recently the nuisance had recommenced, and these cases had now been placed in the hands of the Council's solicitor with a view to legal proceedings being immediately taken. The committee regretted the view taken by some of the police magistrates that the difficulty in obtaining smokeless coal was a reason which justified persons in causing serious nuisance, especially as they were firmly convinced that nuisance could be abated to a great extent, if not entirely, even when smokeless coal was unobtainable. At most of the premises at first productive of nuisance a remedy was found by careful stoking, by the more judicious choice of fuel, or by the employment of improved appliances, but at electric light stations, in regard to which the proceedings had either been dismissed or considerable time given within which to provide a remedy, the nuisance not only remained unabated, but continued in an aggravated form, as the companies felt secure from further proceedings. With these exceptions, and the further exception of the steam craft on the Thames and of places over which the Council had no jurisdiction, they believed that the more serious nuisance from black smoke came to an end in July last and had only since recurred from time to time on two or three premises with which they were dealing.

BELFAST NEW ELECTRIC-LIGHTING STATION.

The formal opening on Tuesday last by Earl Cadogan of the extensive range of buildings which the Belfast Corporation have found it necessary to erect, owing to the inadequacy of the original premises in Chapel Lane to supply the increasing demand for electric current, was a ceremonial function which awakened a large amount of interest among the citizens.



The new station, which occupies a commanding position at the corner of East Bridge Street and Lagan Bank Road, is, not only as regards size, but in the general excellence of its arrangements and equipment, entitled to rank as one of the most important and complete buildings of the kind in Europe. The total space occupied by the building is considerably over half an acre.

The ground floor is occupied by the engine-house, boiler-house, with space for economisers, coal bunkers, pump-house, &c., battery-room, men's mess-room, timekeeper's room and men's lavatory accommodation. The engine-room, a special feature of the establishment, is very spacious and lofty, being 200 feet by 40 feet, and has its walls lined throughout with coloured glazed bricks.

"JANUS" WORKS, QUEEN'S ROAD, BATTERSEA.

LIVERPOOL and MANCHESTER — W. Sprowson, Norton Street, Greengate, Manchester.
BIRMINGHAM—W. J. A. Kerr, Prudential Buildings Corporation Street.
GLASGOW—J. Monkhouse Cartmell, 70 Great Clyde Street.

VOLUME LIX. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Office: 175 Strand, London, W.C.

On the first floor are the drawing, general and private offices for the various officials, with strong-room, engineers'-room, store-room, sample-room, meter-testing and meter store-rooms, superintendent's-room and lavatory accommodation. The second floor is arranged as a residential flat for the engineer-in-charge, consisting of a large suite of bed and sitting-rooms, with bath, lavatory, kitchen, &c. The principal façade, which is towards East Bridge Street, along which it extends for about 225 feet, is effectively treated in red brick and Giffnock stone in the style of the English Renaissance. The principal entrance, which is not yet completed, will be from East Bridge Street, the entrance for goods, &c., being from Lagan Bank Road.

The chimney, a novelty in tall chimney construction, is of quite an ornamental character, the red brick being judiciously relieved with courses of artificial stone, while a cornice and mouldings of the same material have been introduced in an effective manner, the whole being surmounted by a cast-iron cap to which four lightning conductors have been fixed. The height of the structure is 180 feet, and the base 26 feet 6 inches. It is carried on 154 round timber piles. The various departments of the establishment have been so arranged that they can be duplicated should the public requirements necessitate an increase in the accommodation.

The contract for the building was secured by the contractors on July 1, 1897, and although some time was lost at commencement owing to labour troubles, yet the whole building has been completed in a little over twelve months.

The piling of the building, a separate contract, was also done by the same contractors. The 1,190 piles were driven in 37 days, or an average of 32 piles per day—a record in pile-driving.

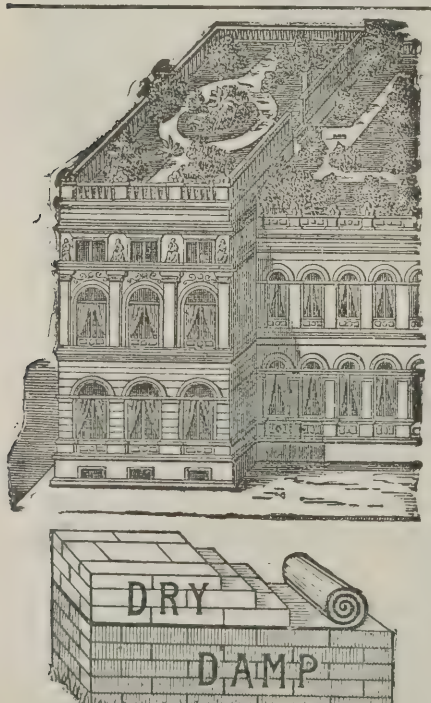
The building has had over 1,500,000 bricks used in its construction, 250 tons freestone, 450 tons iron, 3,250 tons concrete and one-third acre of glazing. It has been successfully carried out under the supervision of the firm's manager, Mr. James Hanna, and Messrs. Patrick Brennan and William Service, foremen.

The constructional ironwork was supplied by Mr. James M'Millan, Glasgow, through his Belfast agents, Messrs. Scott & Rea, and the castings by Messrs. Stephen Cotton & Co., Belfast. The plumbing-work has been done by Mr. Harrison M'Cloy, and the painting by Messrs. George Morrow & Son. All the work was carried on under the superintendence of the efficient clerk of works, Mr. James Moore.

The architects for the work were Messrs. Graeme-Watt & Tullock, and the contractors for the entire work Messrs. J. & W. Stewart.

The specially-designed gold key with which his lordship performed the opening ceremony is of elaborate workmanship; the stem is curved and rich members at the lower part and also towards the capital. A large centre globe supports the scrolls which arch over and form the framework of the key. The upper curves support an imperial crown, below which is shown the shamrock set with emeralds.

In centre of obverse of head are the arms, crest and motto of Earl Cadogan in proper colours, and on reverse of the crest is a device illustrating electricity, while the inscription is engraved in the shield on back of arms. Round the head of the key are turquoise, pearls and emeralds, forming a beautiful combination.



The key is enclosed in silk velvet case.

EXTENSIVE SEWERAGE SCHEME FOR MORECAMBE.

A PUBLIC inquiry was held at the Morecambe District Council offices on Friday morning, before Colonel W. Langton Coke, Local Government Board Inspector, into an application by the District Council to borrow 60,000*l.* for purposes of sewerage and sewage disposal, and also 1,590*l.* for works of private street improvements.

In explaining the scheme, Mr. Nicholls, the engineer, said that taking the present population at 11,000, the scheme allowed for an increase in the present population and for visitors, and provided for an aggregate of 60,000 people. The sewage works would take about three years to complete, and by that time the normal population would be about 15,000, for which provision should be made during five months of the year. From about three months at the beginning and end of the visiting season the population would be increased to 25,000, and during the summer months to 45,000. In the near future, on the above basis, the population was likely to reach 60,000, and he considered that the scheme should be so constructed with regard to outfall sewers and the discharge of sewage into the bay to deal with the full population. The scheme had been laid out accordingly. The sewers themselves varied in size from 9 inches to 24 inches in

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

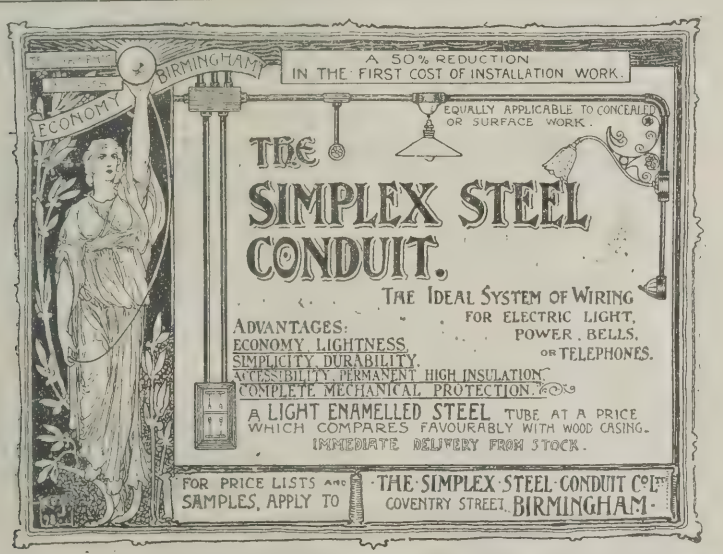
OLD FORD, BOW, LONDON, E.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C.

diameter, the smallest being for the contributory arterial sewers of the district. The main outfall sewers were divided into two parts in eastern and western. The eastern district, being the larger, would have an outfall sewer 24 inches in diameter, with a gradient of 1 in 850, and the one for the western district would have a gradient of 1 in 745. The discharging capacities of these main sewers would be 1,723,500 gallons in six hours. Taking the water supply, which at present was about 18½ gallons a head per day, for the basis of the sewage scheme, and allowing 20 gallons a head on the full population, they would get 1,200,000 gallons in twenty-four hours. The pumps and the machinery were arranged in sets to work independently for the normal flow during the winter period, during the times between the autumn and spring, when the visitors were here in smaller numbers, and during the busy time in the summer season. After being raised by the pumps, the sewage would flow through a channel alongside and into a set of tanks, constructed on the septic system. Here it would be treated, after which the outfall would pass into another channel, and thence into a large tidal culvert, with a containing capacity of 800,000 gallons. This culvert would receive the sewage and retain it during high water. The capacity really required was a maximum 600,000 gallons, but provision had been made for receiving any extra in case of storm, or from the yards and roofs of houses. The treated sewage would be received in a tidal culvert, and let out about an hour or an hour and a half after high water, and be discharged at the point in the bay called "Seldom Seen." From float experiments he had found that that point was the best that could be decided upon, because the currents set direct west, and went about a mile and a half to the west of the new docks at Heysham, continued south and south-west, then took a curve, and went into the bay further west and then into the main channel, so that there could be no chance of sewage pollution on any part of the foreshore in the bay. The inquiry also covered the sewerage of Bare, and this portion of the scheme being explained, Mr. Nicholls then submitted some of the items of cost, as given in his estimates. The tanks would cost 7,945*l.*, and for the clerk of the works and his assistant he had put down 6*l.* per week for three years.

The inspector said it was a large scheme, and he would prefer trial holes to be dug. He did not want to put back the work, but otherwise the only alternative was to put the report back, and recommended that the consideration of the application be deferred until the trial holes had been dug. Questions being asked by the inspector of a detailed character, and satisfactorily answered by the engineer, the inspector remarked that the scheme met with his general approval, and he would do all he could to forward it with the Local Government Board.



CENTRAL LONDON RAILWAY.

An extremely interesting visit was made by a party of the members of the Society of Engineers on Tuesday, October 11, to the Central London Railway Works at the Post Office station, E.C.

Among those present were Mr. W. Worby Beaumont, president; Mr. Henry Adams, past president; Messrs. J. C. Fell and Charles Mason, vice-presidents; Messrs. J. Patten Barber, Joseph Bernays, George Burt, Percy Griffith and R. St. George Moore, members of council; Mr. Perry F. Nursey, hon. secretary and treasurer; Messrs. H. W. Andrews, R. L. Andrews, J. C. Belton, A. R. Burch, W. G. Bower, H. O. Carr, S. O. Cowper-Coles, G. B. Cutler, F. E. Duckham, P. M. Faraday, N. Harker, W. H. Hill, A. E. Hubert, E. Hulburd, A. J. Lenton, W. R. Phillips, H. Puplett, J. J. Rawlings, G. M. Robins, F. A. Robinson, J. Waddington, Capt. Walter Wood, and Mr. G. A. Pryce Cuxson, secretary.

The constructive work of the Central London Railway was divided into six contracts. Beginning at the west end at Shepherd's Bush, the first three contracts were let to Mr. John Price, whose work extended to the Marble Arch. From thence to the General Post Office includes two contracts, both of which were secured by Messrs. Walter Scott & Co., of Newcastle-upon-Tyne. Contract No. 6 extended from the General Post Office to the Bank, and was let to Mr. George Talbot. This includes the General Post Office station and the Bank terminus as well as the important work beneath the roadway in front of the Mansion House.

The line runs throughout almost entirely in the London clay, the exceptions being where it passes up through the gravel at the western end, and also the length extending from Berners Street, Oxford Street, to Red Lion Street, Holborn, where the tunnels run along the line of junction between the Reading beds and the clay. The former consist of green and red marl, with patches of rock, but not being water-bearing, compressed air is not required for the working. Air at moderate pressure was, however, used where the tunnels come to the surface at

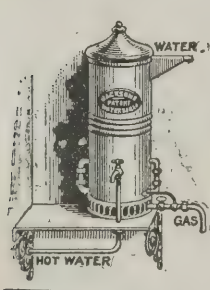
WORKS, ROTHERHAM. Estab. 1854.

Shepherd's Bush. A part of the line which has received a good deal of consideration is that which crosses the Holborn valley and runs under the Viaduct. Here the tunnels keep in the clay even in passing under the site of the old Fleet Ditch, but the dip of the ground naturally brings the line closer to the surface. In consequence of this and the superincumbent pressure of the Viaduct, it was determined to use compressed air along this section as a matter of precaution, and not with any idea of excluding water, which it was not anticipated would be met with.

The line consists of two tunnels for the up and down lines respectively. The usual diameter of these is 11½ feet inside. Where there are stations the tunnels are enlarged to 21 feet 2 inches in diameter, so as to take platforms, &c. There are also cross-over tunnels of 25 feet internal diameter for the purpose of connecting the up and down lines and affording shunting facilities.

The rail-level in the stations will be 80 feet to 90 feet below the surface, and passengers will be conveyed to the platforms by lifts which it is proposed shall be worked electrically. After leaving the stations the tunnel runs down at a gradient of 1 in 30 for a distance of about 300 feet, whilst the gradient in approaching is 1 in 60 for about 600 feet. This puts the stations about 10 feet higher than the main length of line. The figures vary somewhat, but those given may be taken as general.

Starting at the surface, the first operation is the sinking of the shafts, which, in the completed work, will give passengers access to the line. In each station there are two shafts, each 23 feet in diameter, and one of 18 feet diameter, and as the company have taken as little surface land as possible on the line of route where land is so supremely valuable, the site is pretty well crowded, the shafts occupying about half the available area. The shafts are lined with cast-iron, and the first part is put in by bolting the segments together and sinking the rings bodily by means of weighting—baulks of timber being placed across for the purpose—whilst excavation is carried on from the interior. No great weight is required to sink the rings, the gravel being fairly free as a rule. When the clay is reached and has been penetrated for a foot or two underpinning is started, the clay being removed to the net diameter of the shaft and the segments lowered down and put in position singly beneath the work already in place. Each ring, as completed, is grouted at the back to fill up any space between the iron and he earth. The bottom of the shaft is formed by 2 feet or 3 feet of concrete. All shafts were sunk by the aid of steam locomotive cranes.

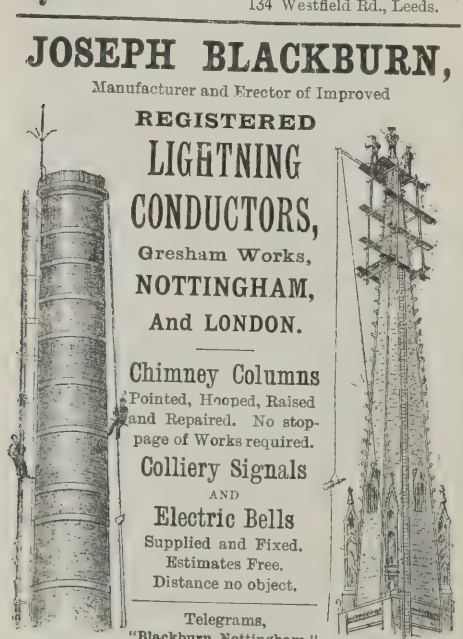


When the shaft is finished, the head-gear, which is to be used throughout the tunnelling operations, is erected. At the Post Office station steam winches are used for raising and lowering the temporary cages in the shafts, but at the Bank and other stations hydraulic lifts are used, the power being taken from the mains of the London Hydraulic Power Company. At all stations every precaution is taken to avoid creating any nuisance by noise or otherwise to the surrounding householders.

The clay is brought up in ordinary tubs by the cages on to a raised platform, and tipped through tumblers into the carts. The bulk of the spoil is taken to wharves on the river, to be carried by lighters to Barking, where it is being deposited for reclamation purposes. Of the iron lining for the tunnels, bricks, lime, cement, &c., about sixty loads per day of twenty-four hours are, on an average, sent down at each station.

The permanent passages of the stations, which will afford accommodation for passengers, leave the lifts at a height of about 10 feet above the rails. It is therefore necessary in all cases to drive a temporary passage at the level of the rails in the tunnel. These passages are of 8 feet internal diameter, and have all been iron-lined. On the line of tunnel being reached, a break-up is formed, and a cylindrical chamber, iron-lined, is constructed, in which to erect the tunnelling shield. This chamber, which is, in fact, the first part of the tunnel formed, is 15 feet in diameter and 7 feet long, being larger than the tunnel proper. In this chamber the shield is erected.

The shields used in constructing the tunnels have worked admirably throughout. They are of two kinds, namely, a large shield 22 feet 10 inches outside diameter, which is used for the stations, and a smaller shield, the ordinary diameter of which is 12 feet 8 inches, although there is a slight variation in the latter, in order to meet the case of tunnels requiring to be made of larger diameter in parts of the line that are on a curve, and where, therefore, extra clearance has to be allowed to the rolling stock.



The length over all of the station-shield is about 6 feet 10 inches. The shell or skin is formed of strong steel plates carefully fitted and strongly rivetted together, and strengthened by two strong cast-iron rings. Each ring is made up of twenty-two segments, the joints of which are accurately machined and strongly bolted together, the front ring forming a cutting edge. The inner ring forms the main body of the

CASES for BINDING THE ARCHITECT Price 2s.—Office: 175 Strand, W.C.

shield, on which are fixed twenty-two hydraulic rams. Between these two rings comes a strong steel diaphragm plate, to further augment the rigidity of the whole. The rams each consist of a ram, with its cylinder or case, and a cross-head for the end of the ram, the latter of which is formed to bed on the flange of the tunnel rings. The rams are coupled together, and are in communication with hydraulic pressure pumps by means of a series of pressure and return pipes, in which are fixed shut-off valves to each ram, so that any one or more rams may be disconnected, and the direction of the forward movement of the shield thus controlled. In these pipes are also placed two reversing valves, the use of which is to direct the flow of pressure-water so as to either force the rams in or out as required. The return water from the ram cylinders is delivered back into the supply tanks of the pressure pumps, so that it is used over and over again.

The structure of the shield is further strengthened by two vertical and three horizontal stringers formed of steel plates and channels, these being strongly connected at their ends to the body of the shield. The station shields are provided with what are called hydraulic erectors that are used for lifting into position the segments of the cast-iron rings forming the tunnels, ready for bolting together in their permanent position. The erectors consist of an hydraulic lifting cylinder pivoted on a strong centre, which is securely bolted to one of the vertical stringers. The lifting cylinder is fitted with a ram which has a head on the end of it so constructed as to be readily attached to the tunnel ring segments. There are two turning rams attached by chains to a wheel on the pivot of the lifting cylinder by which means the latter is turned to any required position. The erectors are operated by suitable valves geared up to handles conveniently placed on the floors of the shield.

The operation of the shield may be described as follows:—When the ground in front is sufficiently removed to allow the shield to be pushed forward, the water-pressure is admitted to the rams, the heads of which are against the last ring of tunnel-plates put in. As the rams move outwards, they push the shield forward. After they have made a full stroke the shield has been advanced a sufficient distance to allow a ring of tunnel-plates being put together in the back portion of the skin of shield after the rams have been forced back into their cylinders. The ring of tunnel-plates is then securely bolted together and to the last ring, and the operation for the getting in of the next ring proceeded with.

The small or ordinary tunnel-shields are similar in construction to the large station-shields. This skin is formed of two thicknesses of steel plates, the total length of the shield being 7 feet. The front or cutting end is formed of a strong circular cast-iron ring, divided in halves, on which are secured steel knives, made in short segments, and forming a perfectly true circular cutting edge. The knives are so arranged that they can be adjusted to cut a slightly larger diameter than the body of the shield if necessary. Behind the cutting-edge ring comes a strong bulkhead, in which is a heading-out hole 6½ feet high by 5¼ feet wide. At the back of the bulkhead there is a strong ring of cast-iron made in six segments, having flanges which form the joints between each segment. These joints are securely bolted together, and the ring is also well bolted to the skin of the shield. On this ring are secured hydraulic rams similar to those on the large shields, one on each segment of the ring, or six in all. These are connected by pressure and return-pipes to two hand-pumps, each fixed to strong water-tanks securely bolted into the shields. The working of these rams is the same as that described for the large station-shields. The hand pumps are fitted with compound rams, one ram being larger than the other. The object of this is that by a simple arrangement the larger rams can be operated, while the pressure required is not excessive, as is always the case when the rams are only being pumped in after having advanced the shields to their full length, and sometimes when the shield is in places where the resistance to its progress forward is not excessive. The movement of the shield by the larger rams is naturally much faster than when the smaller ones are used. When greater pressure is necessary, the smaller rams are thrown into gear, thus making the working of the pumps lighter, but the movement of the rams is correspondingly slower. Each hydraulic ram is fitted with a shut-off valve, as described for the large shield, and a reversing valve is also used, so that the rams can be moved outwards or inwards as desired, the return water being delivered into the pump tanks as it leaves the ram cases.

In operating the ordinary tunnel-shield, after it has been erected in the chamber provided, the first thing to do is to drive a heading in advance 7 feet or 8 feet. If the ground be hard, the whole of the clay is removed in front of the shield for the distance of one ring, or 20 inches, with the exception of an annulus of from 1 to 2 inches, which is left for the cutting-edge of the shield to take away. Before the shield is moved forward a number of pointed pieces of timber are placed horizontally in front of the shield, their pointed ends being inserted in the face

THE WELL-KNOWN FRIEZE,
ENTITLED
"THE CORN FIELD."
1. Ploughing. | 3. Mowing.
2. Harrowing. | 4. Carting.
5. The Products of the Corn Field.
Length, Fourteen Feet Seven Inches by Fifteen Inches deep.
A SPLENDID EXAMPLE OF COLOUR-WORK IN PERMANENT INK PHOTO, BY
M. PAUL ALBERT BAUDOIN.
This magnificent Illustration was presented to the Subscribers to "The Architect" in 1886. A few Proofs were taken, which immediately became out of print.

OPINIONS OF THE PRESS.

"We are not surprised to hear that there has been a great demand for the beautiful reproductions of the well-known frieze by M. Paul Albert Baudoin, entitled 'The Corn Field.' The plates have been reproduced by subscription at half a guinea the set, and so great has been their success that a second edition is being issued."—THE LADY'S PICTORIAL.

"They are beautifully done in colours by the permanent ink photo process, and form a very artistic and pleasing set at the extremely moderate price of half a guinea."—THE STAGE.

"The well-known frieze entitled 'The Corn Field,' which is a splendid example of colour-work in permanent ink photo, by M. Paul Albert Baudoin, is to be reproduced by subscription of half a guinea a set. They are exceedingly artistic, and would grace the walls of any house."—THE GENTLEWOMAN.

AND NUMEROUS OTHERS.

In consequence of the almost daily demand for these Plates, they have been reproduced by Subscription at Half a Guinea the Set, and are now ready for issuing.

P. A. GILBERT WOOD, 175 STRAND, W.C.

and the other ends abutting on the shield. As the latter is forced forward by the hydraulic rams, the clay is loosened by these piles being broken down into the heading, and the miners then get through the shield and remove the earth. When the shield has been pushed forward sufficiently far by the rams—the latter pressing against the completed end of the iron lining as an abutment—the next ring of lining is erected inside the tail of the shield, and, having been bolted up, the shield can be again moved on. The annular space between the earth and the iron lining, left by the advance of the shield—it being remembered that the ring of the lining is erected inside the tail of the shield—is filled up by grouting, which is forced through holes purposely made in the lining by means of compressed air.

The rate of progress varies from two to four rings erected per shift, or from 40 inches to 80 inches completed for ten hours' work.

The method of working the larger shield is not greatly different in principle to that of the smaller one, excepting that no advance heading is driven. The interior of this shield is divided up by two vertical girders and three horizontal platforms, and there are the rams with tables supporting the face, as already stated. The earth is removed from the face by hand and is thrown on to the platforms, and from thence to the waggons beneath. There are the piles for breaking up the earth as in the smaller shields. The progress is usually from one to two rings per ten hours, but the rings are 18 inches long.

At the Bank station the general arrangement of shafts and tunnels is the same as at other stations, but the upper station or booking hall is, from its situation, of an exceptional character. By agreement with the City Corporation the station is situated below the open space in front of the Royal Exchange, the railway company constructing for the public use a system of subways and stairways connecting the various streets which meet at this point.

By this arrangement, pedestrians desiring to cross the roadway will be able to do so without incurring the risk and delay now so notorious.

The main or public subway which surrounds the station is 15 feet wide, and will be lined with white tiles and lit by electricity. Under this public subway is placed another, in which are arranged all gas and water mains, telegraph lines, &c., which formerly crossed the street in all directions. This will obviate the necessity of disturbing the roadway for repairs of pipes and the like.

In the central space is the booking hall or upper station of the railway, which, except that its floor level will be some 16 feet below the street, and consequently that its roof will carry the City traffic overhead, is similar in its arrangements to the other stations of the line, and from it lifts will carry the passengers to the platform below.

PATENTS.

The Architect.

THE WEEK.

The *Architect* was the first among the European journals to give illustrations of the wall-paintings of M. Puvis de Chavannes. At the time few of his countrymen were able to appreciate his style, and to the close of his life he was misunderstood by the majority of people in France. The principal reason was that in treating his most important subjects he felt bound to be subservient to the buildings where his pictures were to be placed. There never was a more loyal servant of architecture. Mural decoration was practised for centuries in France, but in general the artists were indifferent to the destination of their works. They were supposed to be suitable for any wall that might offer. Puvis de Chavannes carefully studied not only the character of the building which was to contain his works, but he was no less attentive to the peculiarities of the positions which were assigned to him. Unlike most painters, his endeavour was not to monopolise all the admiration of spectators. In the Panthéon the series illustrating the *Childhood of St. Geneviève*, by Puvis de Chavannes, makes the intervening pilasters and the masonry that is visible more emphatic. That is not the effect of the work of some of the other painters in the building. Puvis de Chavannes in the Panthéon avoided sombre colours, and his palette was restricted to red, brown and white. Elsewhere he has suggested old tapestry, and the general tone was determined by the masonry to be adorned. Of late years it must be allowed he was less controlled by logic, and the works he executed want the charm of the *Ludus pro Patriâ*, the *Happy Land* and the Panthéon pictures. Puvis de Chavannes lived for years in modest style, sharing a floor of a small house with M. Henner, but there was nothing suggestive of bohemianism in his manner; he was one of nature's aristocrats, a French gentleman who was a fitting companion for princes. In his paintings there was no fleshliness; his figures were not mere animals, but suggested spirits enclosed in "a vesture of decay." Yet he was the pupil of Couture, whose "Decadence of the Romans" must always be considered as a dubious sermon about the advantages of temperance. Puvis de Chavannes was born in Lyons in 1824. His success was slowly acquired, for he was excluded from the Salon and remained unnoticed by critics. His first reward was not bestowed until 1867, when he obtained a third-class medal at the international exhibition. But during the last sixteen years there was compensation for the long period he was neglected, although he could not overcome the prejudices of the members of the Académie des Beaux-Arts.

The report on the examinations of the City and Guilds of London Institute for the session 1897-98 states that in all branches of the building trades there has been a marked increase in the number of candidates for examination, and in most of the subjects a similar increase in the attendance of students at the registered classes. The percentages of passes also show improvement in the work. The examiners in brickwork remark that most of the North of England candidates show but a very slight knowledge of cut and gauged work, and whether it be for hard or soft material. It was said that some of the candidates in masonry were under the impression that a knowledge of materials need not form part of a mason's training. The candidates for painters and decorators' work are said to have been instructed in a practical manner, and are able to explain why the different materials used in painting and decorating are employed, and why the successive steps in execution of the work are taken. The most unsatisfactory answers related to dryers, distemper and the form and spacing of letters.

The conversazione of the Architectural Association was held on Friday last in the King's Hall of the Holborn Restaurant. There were nearly 600 members and guests present, and the evening was enjoyed by all. There were paintings and drawings by Sir Wyke Bayliss and Messrs. Brewer, Haig and Weedon, with several students' drawings. Mr. H. F. Waring gained the Travelling Studentship. The orchestral band of Messrs. Dan Godfrey Sons performed, and there was a party of glee singers. Messrs. Doulton & Co., De Morgan & Co. and Martin Bros. lent specimens of pottery. The president (Mr. G. H. Fellowes Prynne) and other prominent members of the Association exerted themselves to promote the interest of the conversazione, and there could be no doubt about their success.

Among the members who assisted at the meeting of the Académie des Beaux-Arts on the 15th inst. was Jules Eugène Lenepveu, the painter, who belonged to the Institute for nearly thirty years. He had won the Prix de Rome in 1847, was awarded third and second medals, was an officer of the Legion of Honour. Two days after the meeting he suddenly expired in his seventy-ninth year. M. Lenepveu was one of the survivors of the old followers of high art. The guide-books testify that he produced some of the paintings which are to be seen in the churches of St. Sulpice, St. Louis-en-l'Ile and Ste Clotilde. The death of Paul Baudry opened a way for him to the Panthéon, where he was entrusted with the commission for the four pictures illustrative of the life of Joan of Arc, and, although he was no longer young, they are the best evidence of his skill. To the amazement of his admirers he also was persuaded by Garnier without much difficulty to paint the ceiling of the Opera House. The subject depicted might be described in the words of Moore, "The best of all ways to lengthen our days is to steal a few hours from night, my dear." It cannot be said the painting proves the advantage of a training in ecclesiastical work for imaginative subjects.

The London County Council have acted fairly towards Mr. Thomas Blashill, the superintending architect. He has been in their service for eleven years, but he is to receive a retiring allowance on the scale of twenty-one years actual service. The pension is calculated at the rate of $\frac{21}{60}$ths on 1,500*l.* a year—the salary received—and works out at 525*l.* a year. Mr. Blashill could have retired three years ago, but at the request of the Council he continued to give them his services. There was an attempt made to have the proposal reconsidered and the pension awarded on the basis of only eleven years service, but it was rejected by the good sense of the majority, and there was no division. Mr. Blashill has acted justly and discreetly during his tenure of office, and we hope he will enjoy the leisure which he has so well earned.

A meeting of the Edinburgh Town Council was held on Tuesday to consider the perennial subject of the site for the Usher Hall. Mr. Waterhouse, R.A., had recommended the West Meadows as suitable, but a majority of the Council preferred Atholl Crescent. One of the members said that the Crescent, although costing 121,000*l.*, would not be suitable because the hall would be out of sight, while the neighbourhood was not like Chambers Street, which was the centre of the population it was meant to benefit. In ten wards out of thirteen in the city there had been a distinct vote against Atholl Crescent. Another member asked whether there was a servitude by the other houses which prevented the building of a hall in the area, and whether that extended to the other houses in Atholl Crescent and Coates Crescent. The town clerk said the houses in Coates Crescent had nothing to do with the houses in Atholl Crescent, which were held from Heriot's Hospital. They were built under condition that they were to be put up according to a specified feuing plan which each of the vassals should enforce against the other. That had been done. If they got an Act of Parliament to build a hall in the middle, they would by the very fact take away the restrictions of the dwelling-houses there, and that would have its effect upon compensation, which would be taken from experts. When the question was put to the vote the former decision of the Council in favour of Atholl Crescent was confirmed, as 29 members were in favour of the site, while 17 voted against it. Parliamentary powers will therefore be sought.

M. GUILLAUME'S DISCOURSES.*

ALL races are liable to epidemics which for a time disturb the mental equilibrium. We are not without experience of them in England. The French may not from their constitution be more subject to those visitations than other men. But from their inability to believe that silence is golden, and to restrain extravagant language, unreal things with them assume proportions like the dreams of invalids, which are painful to the sufferers and disturb the peace of others. At the present time Frenchmen are going through one of those epidemics, and therefore allowances should be made for much which is done by them. They are invalids, and not altogether responsible for their words or acts. Fortunately, there are always men whose sanity is proof against all those incomprehensible attacks, and who often succeed in obtaining for that *bon sense* which is supposed to be an essentially French quality, the supremacy which is its due. In art M. GUILLAUME, the sculptor, is a type of the class. His own work is most refined. What was said of JOHN KEATS is applicable to him; he is "a resurrectionised Greek," and his works would do credit to his great master, PRADIER. His figures are no doubt somewhat cold in expression; but an affectionate anxiety for the prosperity of other sculptors, and a patriotic earnestness for the advancement of French art in general, have made him indifferent about his own gifts. His brother sculptors admit that as a stylist and an æsthetician he is supreme among contemporaries, and his honours have given more satisfaction to others than usually happens with artists. But instead of enjoying the recompenses which from his position were sure to arrive, M. GUILLAUME is always ready to undertake any office or to share in any task which he considers will be advantageous to his country. When he was young it was proposed to make an avocat of him, and he would have attained distinction as a lawyer. Art, however, exercised more fascination over him, and he abandoned THEMIS. Probably he would have obtained still more success if he had become a diplomatist. His tact, judgment, urbanity and shrewdness might have saved France from many a disaster, and those who know him would make no objection if they heard the Fashoda affair was to be left to his decision.

M. GUILLAUME'S competence to undertake delicate duties as an amateur envoy was long ago discovered. In 1848, when the Government of Rome fell into the hands of MAZZINI and his friends, there was an apprehension about the safety of the Prix de Rome men in the Villa Médicis. They were brave enough, but it would be impossible for any heroes to defend a building when the only arms at their disposition were a fowling-piece and a pistol. M. ALAUX, the director, therefore resolved to remove his young artists to some secure place beyond Rome. There were clever and brave fellows among them, such as CHARLES GARNIER, the architect, ALEXANDRE CABANEL, the painter, and the brothers BENOUVILLE; but M. ALAUX preferred to make EUGÈNE GUILLAUME his plenipotentiary, and leave all the arrangements in his hands. The sculptor resolved to begin with the triumvirs. MAZZINI told him there was no danger, for the French School brought credit to Rome. But he allowed himself to be persuaded by M. GUILLAUME. He explained, however, that the triumvirs were not omnipotent. Rome was in a state of siege, and the gates could not be opened without the authority of General AVEZZANA, the War Minister. To him M. GUILLAUME next applied. He also objected and had to be convinced. Then the question arose, How was so large a party to be removed? All the horses in Rome were requisitioned for the artillery. The Minister could not take one. It became necessary to apply to the commander, Colonel LOPEZ. He was most amiable to the envoy. He inquired how many carriages were to be employed, and asked to see the passports. The inhabitants of the Villa Médicis did not possess one. M. GUILLAUME had therefore to exercise his diplomacy on the Minister of Police. That official declined to issue passports without special authority from the triumvirs. Once more there was an interview with MAZZINI, and finally a general passport and three pairs of horses were secured as the reward of M. GUILLAUME'S negotiations. The party reached Florence in an impoverished state. In a very short time a breach was made in the walls of Rome by the French troops, and as soon as the news arrived M. ALAUX and his charges returned to their old quarters. They found the gardens had suffered and the ateliers were in ruins, but the Villa was safe and all the property of the students untouched. An amateur who was able to accomplish so much amidst the excitement of a revolution would be sure to have made a name as a diplomatist. M. GUILLAUME has contrived to serve his country in a different way.

From M. GUILLAUME'S position and experience many people would expect a semi-official yet statesmanlike view of art in France in his "Discourses and Notices." They are mainly personal and descriptive of such men as CHARLES BLANC, PAUL BAUDRY, JEAN ALAUX and ANTOINE BARYE, the narration of whose lives enables M. GUILLAUME to express his thoughts on æsthetics, painting, sculpture and the direction of the Academy in Rome, the last being a subject which has a personal interest for the author, since he was not only a student, but a director of the Villa Médicis.

CHARLES BLANC was M. GUILLAUME'S predecessor in the chair of æsthetics and the history of art at the Collège de France. It is remarkable that although the production of art in its manifold forms is among the greatest of French industries, the science on which art is of late years supposed to be based was not recognised officially until 1878. There appeared to be an apprehension in some way of a connection between æsthetics and treason. COUSIN'S lectures on the Beautiful had to be suspended, and were not published for forty years after delivery. His pupil JOUFFROY found great difficulty in persuading a very few writers and lovers of science to hire a small room where he could give a course on Æsthetics, which was never completed. JULES SIMON, SAISSET and JACQUES, when they prepared a manual of philosophy, omitted æsthetics, although including theodicy. CHARLES LÉVÊQUE, the professor of Greek and Latin philosophy in the Collège de France, became alarmed about the probable consequences of a single lecture upon PLATO and his æsthetics. Yet France was producing many of the most beautiful works of modern times. The selection of CHARLES BLANC as the first recognised professor was, we suppose, determined by the fact that he was author of a grammar of the arts of design, and one on the decorative arts. He also wrote about art in dress and jewellery. To the authorities he was, therefore, supposed to be a practical man who was likely to increase the sale of objets de Paris and to enrich France. It was not to be expected that CHARLES BLANC would take a profound view of the subject, although there could be no doubt about the depths to which he descended in order to find a basis for his disquisitions. He used to deliver gratuitous lectures and provoke discussion in order to discover the popular notions about a subject. A man who would gravely ask an audience to tell him why women loved soldiers and why soldiers liked to make up as women (in those days small waists and expansive bosoms were admired in the élite of French regiments) could not be expected to produce treatises like those of KANT, HEGEL, or FICHTE. But while the German books are still almost unknown in England, CHARLES BLANC'S volumes at one time had a ready sale among us. We must, therefore, speak respectfully of him as a pioneer.

CHARLES BLANC, it must also be admitted, was not one of the cast-iron teachers on art who believe that a lesson when once prepared will serve year after year. He could say with the poet, "In my wisdom there is woe and in my knowledge care." The more he wrote, the more he felt his shortcomings, and the exalted position of professor in the Collège de France only increased his sense of his responsibilities to his generation. To enable him to understand if there was any influence exercised by the land and climate of Greece on the ideas and works of its artists, he made the sacrifice of selling his library, which he had accumulated by much self-denial. He also visited Egypt, and studied in Italian galleries. Yet his experience was that of many other men. Later works surprised him. Before those more ancient his anticipations were only confirmed. As he said, "J'avais connu Rome, j'ai reconnu Athènes." But there were

* *Notices et Discours.* Par Eugène Guillaume, de l'Académie Française et de l'Académie des Beaux-Arts, Professeur d'Esthétique et d'Histoire de l'Art au Collège de France. (Paris: Société Française d'Editions d'Art.)

occasions when he ascertained that what he had taught was erroneous. The sight of the tombs at Beni-Hassan convinced him that the earliest Doric order was not to be found in Egypt.

His ideas expanded before the vastness of Egypt. His early work as an engraver, his philosophy of trinkets and millinery were lowered in value in his own eyes. It is remarkable to find CHARLES BLANC, whose books were adapted to be used by industrial designers, transformed into an idealist. He then believed that architecture was created by ancient priests as a rival of nature, and one that was no less imposing and law inspiring. Its eloquence was due to its mysteriousness, but the priests alone fully understood its full mystic signification, as nature reconstructed by man.

M. GUILLAUME has to give lectures on æsthetics, and he is very competent for the task. But while he advocates the necessity of investigations into the causes and effects of the Beautiful, we doubt if he would assert that one of his courses would make an artist. We cannot help thinking of what he says about buildings, pictures and statues. But the critic who appreciates, or it may be condemns, reasons by the aid of his system of taste, while the artist who creates reasons by instinct. The philosopher must have abstract formulas in order to reason methodically, and if science is not constituted as a body there must be at least ideas to serve instead. CHARLES BLANC was faithful to ideas until the last day of his life. But his idealism was neither that of the philosophers nor that of the artists; it was rather, says M. GUILLAUME, that of criticism, a devotion to formulas which he had worked out, and some which have been since superseded.

In the sketch of PAUL BAUDRY, as well as in one of ANTOINE BARYE, we can easily perceive the kind of preparation for great works which M. GUILLAUME admires. With everyone who knew the swarthy little PAUL, the painter was of far less consequence than the man. He was transparent without the least affectation. There was nothing dramatic about him. He worked in a bare room in order to concentrate his thoughts on his canvas. If his meals were more simple than the ordinary workman's, it was because he was indifferent while painting to other enjoyment—or as he would sometimes say, when one has known misery very intimately, one is afraid to become too indulgent to the palate. His head was as sharply cut as any we see in Roman bronze; it would have served as a general's or an explorer's. But as a painter his individuality was shown by his multiplying difficulties in order to overcome them by force of energetic labour.

BAUDRY had gained a reputation when he received the commission for the decoration of the foyer of the Opera House. He began the work as if he were a tyro instead of a master. Years were spent in study. At one time he was in the Villa Médicis, once more a student and devoted to the examination of the Sistine paintings. At another time he was engrossed with RAPHAEL'S cartoons in London. A long period was spent before the great wall-paintings in Venice. After deriving suggestions from the masterpieces he began his own studies. He was embarrassed by the power of his imagination. PAUL BAUDRY could hardly draw a line without thinking of another which appeared superior, and his sketches suggest his difficulty to determine between the variety. We have already published examples. He was not satisfied with a multitude of sketches. In order to obtain more precision he used to describe in notes his imaginary compositions. When he began to paint the pictures BAUDRY at first worked in a big atelier in the Rue Boissy-d'Anglais, but he was not satisfied until he secured a loft over the auditorium of the Opera House. There he could spend days without the intrusion of a visitor, and he only tore himself from his painting in order to enjoy the atmosphere that surrounded the roof of the building. BAUDRY so closely identified himself with his creations that when the series for the foyer was ended—it occupied him nearly twelve years—he found he was unable to resume the representing of the kind of subjects which he had employed in his easel pictures.

BAUDRY endeavoured by travel in Spain, Egypt and Greece to bring back his former condition of mind. But the proposal to represent the history of JOAN OF ARC in the Panthéon was enough to bring about a revolution in his thoughts. From his childhood he was longing for such an opportunity, and the scenes in her history were as familiar to him as if he had witnessed them. BAUDRY went about his task just as he did with the pictures for the foyer. He endeavoured to become a contemporary of the heroine. In the Bibliothèque Nationale and in the library of the Arsenal he sought out all the documents which belonged to the period. M. GUILLAUME mentions some of them. They comprised chronicles of England and Normandy, besides those of FROISSART, RENAUD DE MONTAUBAN, GÉRARD DE NEVERS, the prayer-book of ISABEAU STUART, the "Miroir historial de France," the "Merveilles du Monde," &c. He made extensive notes from them, and sketched costumes, buildings, armour, furniture. He desired to fill five, then seven, then sixteen panels in the building. He made pilgrimages to all the places connected with the heroine's history. As might have been expected from so much devotion to the period, his sketches for the wall-paintings corresponded in style with the manuscripts which had inspired them. They appeared to be drawn by an illuminator of the fifteenth century rather than by a Frenchman of the nineteenth, who had followed the early Venetians and CORREGGIO, and had painted Roman vestals, Ledas, Fortunes and the like. However, he was never destined to put the history of JOAN OF ARC on canvas. That duty was reserved for M. LENEPVEU, whose noble work we reproduced a few years back—an artist who has now passed away, ripe in years and honoured by all who knew him.

All who have visited the gardens of the Tuileries wil remember the groups of animals devouring their prey which were modelled by ANTOINE BARYE, as well as sundry lions on buildings, groups of figures on the Louvre and statuettes in shop windows which are also his work. He began as an apprentice to an engraver for metal workers, and there could hardly be found a more efficient artist "to the trade" than BARYE. As M. GUILLAUME says, his art embraced all varieties, from goldsmiths' work to monumental sculpture, from the most modest subjects to heroic figures, and men as well as beasts. To the end of his life he was the craftsman rather than the grand signor that so many of his contemporaries who were inferior in ability affected to appear. Patrons preferred to have works by him which suggested the savagery of animal life. The majority who gaze at the examples imagine that with such vast masses power alone was to be expressed, and there was no need for that extreme accuracy which is needed in the representation of men and women. There never was an artist who toiled more constantly to attain truth than BARYE. He haunted the grounds, cages, dissecting-rooms and galleries of the Museum of Natural History. Life had hardly left a ferocious animal when the sculptor commenced to measure and model the remains. He had gained the favour of the CUVIERS and of GEOFFROY SAINT-HILAIRE and had mastered their theories. He was well acquainted with the conclusions of the professors of comparative anatomy about the unity of forms. There were few skeletons in the museum of which he had not taken records, and his measurements were not merely in feet and inches but in lines. BARYE must have known how little was the credit he was likely to gain from so much devotion to the truth. His patrons and the public were incompetent to appreciate the accuracy which was attained; only a few anatomists could discern the distinguishing quality of BARYE'S work. But an artist can be as conscientious as other men, and the sculptor would have lost his self-respect if he had not been over-fastidious.

JEAN ALAUX has no reputation like BAUDRY'S or BARYE'S. He was one of the last representatives of academical art, a variety which is no longer in favour. Born in 1785 and living until 1864, he witnessed many artistic as well as political revolutions. In 1814, when he was competing for the Prix de Rome, he fought under MORTIER in the defence of Paris against the Allies. He gained the prize in the year following, and in 1816 arrived in Rome. When six years afterwards he returned to Paris, he found himself amidst theories to which he was a stranger. GÉRICAULT and DELACROIX had adopted new principles, and put them into pictorial form. Critics like THIERS applauded them, and the public rejoiced at the novelty. What more natural for a votary of academicism than to feel bewildered and to return to Rome? That was how

Alaux acted; he was too gentle for a combatant, and he fled to what was the home of his art. He was nearly forty when he ventured to exhibit a *Lapith* and a *Psyche*. The State could not well neglect an artist it had created, and Alaux received commissions to represent two characteristic subjects, *Justice leading Abundance and Industry on Earth* and *Justice Watching over a Reposing World*. He also painted Scripture pieces and the inevitable *Scène de Brigands*, which was a testimony of residence in Italy. The creation of the Musée at Versailles enabled him to paint battle scenes and portraits of warriors. He also executed other public commissions, and if he did not produce masterpieces, at least he gave representations of scenes which, being a sort of history made easy, satisfied the multitude. Louis Philippe made the important discovery that a room which Alaux had represented with red hangings was hung with blue. The painter changed the colour, and the king, who was proud of his discovery, rewarded him with the cross of an officer of the Legion of Honour. What simple times they were. M. Alaux also painted visits and dinners of the Corporation of London, who saw in Louis Philippe a person who was worthy to be an alderman, and M. Guillaume testifies that in the studies if not in the finished pictures he was able to recognise the originals.

It followed as a matter of course that Alaux should become director of the academy at Rome. He was a paternal chief who never kept aloof in awful state, but was ready to talk with every student about his special art. Nor was he afraid to cite his own example to suggest what was to be avoided. During the reign of Alaux the bourgeois king was forced to seek shelter in England, and in Rome and elsewhere in Italy revolutions broke out, but the director displayed the prudence that was desirable and held office until 1855. His departure led to the introduction of a new system of study.

The works of Alaux have not had much influence on his contemporaries or on the artists who followed. M. Guillaume revives his memory for two reasons. First, he has an affectionate feeling for his old director, and secondly, he wishes to point out how thorough was the teaching in the old time. Nowadays, as he says, even the grand talents are incomplete. Certain qualities are admired, while others no less essential are condemned, and thus it happens that works which are "faiblement équilibrées" are accepted with delight.

The fact is, French politics are demoralising French art as well as French literature. Indeed, it would be hard to discover what is free from that baneful influence. A *coup de théâtre* is now alone successful, and unless pictures, statues and buildings amaze spectators they are neglected. The Fashoda incident is simply the latest of many efforts to gain success by surprises with a people "faiblement équilibrées," and its failure will, we hope, be followed by a healthy reaction in French life.

BRITISH SCHOOL AT ATHENS.

ON the 20th inst. the annual meeting of subscribers to the British School at Athens was held in the rooms of the Society of Antiquaries.

The report of the managing committee stated that the committee have to report a session whose results, though less varied in character than those of some of its predecessors, will probably be found to compare favourably in scientific value with any that the school has hitherto obtained. The excavation of the prehistoric site at Phylákopi, in the island of Melos, has led to the discovery of a vast quantity of pottery (painted and unpainted), as well as many stone implements and such other objects as are usually found on early Greek sites. What makes the site especially important from the scientific point of view is the existence of three clearly defined settlements of different epochs, represented by superincumbent layers, the proceeds of which have, needless to say, been scrupulously kept apart for purposes of study and comparison. The number of students during the past session was seven. Of these, Mr. A. E. Henderson (gold medallist and travelling student of the Royal Academy) has been wholly occupied in drawing and painting details of Byzantine buildings in Constantinople. Of the remaining six students, four are graduates at Oxford and two of Edinburgh, one of the latter (Mr. Mackenzie) having also a Vienna degree. That none of the students were Cambridge men is a purely accidental and unusual occurrence, and both the recently elected travelling students of the University (the Craven and Prendergast students) have been admitted to membership of the school for the coming session, and have already proceeded to Athens. Of the seven students of last session, two (Mr. Duncan Mackenzie and Mr. C. C. Edgar) were admitted for the third time, and one (Mr. J. W. Crowfoot) for the second time. The first of these had spent the summer of 1897 in a journey among the Cyclades, which proved fruitful in new archæological results, especially of the prehistoric period. Notwithstanding illness, he was able to render excellent service in the excavations of Phylákopi. The committee have secured his services for another session by a grant of 50*l*. Mr. Edgar, formerly Oxford Craven Fellow, rendered invaluable service in sorting and preparing for publication the pottery from Phylákopi. Mr. Crowfoot, Hulmean Exhibitioner of Brasenose College, did some surveying on the island of Sphakteria; and at the end of March went to Cyprus in order to supervise, on behalf of the British Museum, the excavation of a cemetery near Larnaka. Late in April he went to Smyrna, and in May started with Mr. Anderson for the interior of Asia Minor. The three new students are Mr. W. A. Curtis (Heriot Scholar of Edinburgh University), Mr. A. J. Spilsbury (of Queen's College, Oxford) and Mr. E. B. Hoare (of Magdalen College, Oxford). Mr. Curtis worked at first in the library and museums with special reference to ancient Greek dress. Later he travelled in Greece, and attended the excavations at Phylákopi, where he did most of the photographing, and assisted both in supervision and in sorting pottery. Mr. Spilsbury was elected to the studentship offered to Oxford by the committee of the school, and came out late in January for three months only. These he spent in studying monuments and travelling in Greece. Mr. Hoare was sent out in April as architectural student, to draw plans, &c., for the excavation in Melos. He both drew plans and copied in colours certain of the finds in spite of ill-health, and he remained at Phylákopi until the close of the work. Mr. J. G. Anderson, formerly a student of the school, has been exploring Asia Minor, and Messrs. Arthur Evans and J. L. Myres, associates, have been exploring Crete. Professor E. A. Gardner, former director, went in May to advise the Greek Government with regard to the consolidation of the Parthenon. Reference may also be made to Mr. J. G. Frazer's monumental edition of Pausanias, part of the material for which was collected by him as a student of the school. Another old student, Mr. W. J. Woodhouse, has written an important monograph on Aetolia. Mr. G. C. Richards, formerly a student of the school, afterwards Professor of Greek at Cardiff, and now tutor of Oriel, was appointed for four months to the temporary post of assistant-director, and delivered lectures in the museums to students and (at Easter time) to visitors. The fabric of the new students' hostel, which is to be known as the Macmillan Hostel, was completed before the opening of the session, and has been in use throughout the year. The library has again received large additions, and some 250 volumes have been bound during the year. The accounts presented show that the small accumulated capital of the school had been reduced by about 360*l*. The committee must also remind their subscribers that several most important subscriptions were promised for five years only from 1895, and have therefore but two years more to run.

The Bishop of London, who presided, in moving the adoption of the report, said that it told a story of very considerable work accomplished, and work which carried with it great promise for the future. It would be easy for him simply to move its adoption, but he found on the agenda paper that he was to deliver an address. To give an address on such an occasion was a difficult thing, as he was speaking to experts, and had no claim to be considered an expert himself. He would rather therefore address himself to the experts who were not present. It was for non-experts, it had been said, that public meetings were called, as they gave opportunities for enlisting their sympathy in that most profitable form of all, subscriptions. He felt that the great importance of the British School at Athens lay in the fact that it was the most conspicuous institution which recognised the study of archæology—the one of our institutions, in fact, which was engaged in training archæologists. There was nothing more remarkable in modern study than the place which archæology was taking in supplying gaps in our knowledge. We had become familiar with the conception of human development, and archæology was one form of recognition of the fact that man's activities and energies in the past were to be tracked in every sphere, however remote, and to be found in every region. The careful collection of materials for comparative study produced results of immense importance in filling up the hitherto void spaces of human records. Discovery in the present day had filled up the map of the world in a manner which would have surprised our ancestors. In like manner archæology was engaged in filling up the records of remote ages with astonishing rapidity. It was therefore a matter of great moment that those who were engaged in this process should be properly trained. That aim was being fulfilled in the British School at Athens, which was

established to supply such training in the place where it could best be obtained. The work of archæology was really to abolish the difference between historic and prehistoric times, and the area which lay between them was being swiftly bridged over. He had recently been reading a writer who, moralising on the trite theme of the futility of human aspirations, asked what reputation survived 100 years. If it did, said this writer, it was simply to become the vehicle of some historian's theories. There was much truth in the observation. Great names too often survived simply to become pegs upon which the historian hung his generalisations; as the perspective changed, human reputations changed, and the records did not afford much help. No doubt we read into the records of the past the prepossessions of the present. But the archæologist interpreted the record of man's activities in the stones which had survived from past ages. The process went on with marvellous vigour. The collection of materials, the piecing of them together into an intelligible whole, required training in methods of comparison, and the great centre where that training could be accomplished was undoubtedly Greece, where lay the key of the beginning of almost all knowledge, whence was transmitted to us the thoughts of the East, and where those thoughts received definite outline and form. Greece was the starting-point not only of our thought, but in large measure of our commerce and enterprise. It was the meeting-point between the East and the West, and the place where the prehistoric and barbarous things could be seen in the process of moulding into forms common to all civilisation. In Greece, therefore, each discovery of archæology added to our knowledge, and nowhere else could the wonderful course of development in the past be so advantageously studied. The excavations and explorations which had been effected were systematised by archæology, and in that labour the British School, in common with those of every other European nation, was bearing its share. It was especially gratifying that in connection with the school there should be such an institution as the hostel, where not only students could be housed, but the unlearned traveller might be enabled to make the best of his visit to Athens. It was our habit to do these things independently of Governments, of which we had a wholesome dread. Private enterprise awakened energy and zeal in a way which was impossible to a mere Government department. We were sometimes apt to grieve that we did not receive so much encouragement from Government as our continental neighbours. But there was probably on that very account more vitality in the work and a deeper impression on the public mind. Englishmen did things thoroughly, even when they did them by mistake. In the museum at Spalato was a book published by Adam in 1764. Adam was an architect engaged in the study of Classical buildings, and desired to examine Diocletian's palace. The result was that he produced a monumental work whose value had not been impaired by age, yet it was not clear that his own work was made the better by his investigations. Englishmen, in a word, were like Saul, the son of Kish, who went out to look for his father's asses and found a kingdom.

Mr. Penrose seconded the motion, which was carried.

Mr. Hogarth, the director, read his report, in the course of which he expressed the obligations of the school to the Government of His Majesty the King of the Hellenes for the singular courtesy shown in the past season, especially for the generous aid afforded towards a settlement of the difficult negotiation for the Phylákopi site in Melos; to the French School for their sympathetic invitation to the Jubilee fêtes held last Easter; to the new Austrian School, cordial congratulations on its birth and promise, and to the directors of the German and American Schools for all kinds of help and advice freely given on many points. The relations of the British School with all its neighbours left nothing to be desired. As to the work of the school, it would be best to define clearly its functions. These were twofold—education and research. The first divided itself into education in æsthetics and education for research. Neither in his view was a primary object of the school, the first being really not archæology, though often miscalled so. The second ought to be well nigh completed before students come to Athens at all—at the Universities and English museums. As a matter of fact the functions of the school were limited—first br its small staff. If the British School was to be a teaching institution it must provide itself with such an organisation as the German School had. It should also be remembered that few men could afford such a luxury. The supply of such students would always be small. The second function, research, was the one which both in theory and practice the school performed best. In fact last year a large majority of the students represented this side. The research might be:—(*a*) Individual, for which the school provides trained advice, a library and all possible facilities; but the researchers, mostly graduates of full age, took their salvation into their own hands. Again, their numbers could never be large owing to want of endowment for long terms of residence abroad—English students not being supported by their Government—and to want of endowments at home, professorial chairs, museum places and the like. The school had only a very small and uncertain nucleus of men working at archæology as a profession. On the increase of this would depend its international reputation. (*b*) Collective, undertaken by the school as such. This was principally by excavation. The scene of action during the past season had been the most important prehistoric capital of the island of Melos, discovered at Phylákopi, on the north-east coast, by Ross, and reported on by Dummler. The school began to excavate it in 1896, little suspecting its great importance. It was proving a second Hissarlik, an undisturbed repository of the products of the primitive civilisation of the Ægean from the "Mycenæan" age back to the Neolithic period. Much had been eaten away by the sea, but what was left was equal in extent to Tiryns. Mr. Hogarth picked up the work where Mr. Cecil Smith left it, and after determining the limits of the city on south and east, and digging test trenches to obtain a relative chronology of the potsherds in which the site was marvellously rich, proceeded to open out the great barrack-like structures on the north and west. Here were remains of three settlements, divided by layers of débris, the middle and lower ones being singularly well preserved. The best rooms were on the higher ground to the west. The blocks were divided by narrow lanes with covered drains down the centre. The depth varied from seven metres to three metres. In the two lower settlements was found a mass of pottery, and almost as many vessels, complete or little broken, as in a large cemetery. These covered the whole development of the potters' art up to the fine Mycenæan work. Fabrics, shapes and decoration were in many cases new. The most notable vase was pipe-shaped and decorated with four scantily-clad figures, bearing fish in either hand. This was about the most interesting primitive Ægean vase in existence. In several rooms painted fresco was found, in one case white and gold lilies on a red ground; in another a beautiful scene of the sea with flying fish and marine growths and a man working a casting net. Of the primitive symbols now attracting so much attention on Cretan stones, &c., over fifty distinct examples were found scratched in clay before baking. Many fine steatite vases, clay lamps (unknown previously on early sites), and other stone utensils and implements came to light. There was a little bronze and bone, but no gold or silver.

The site was to be continued next spring and its cemeteries examined. When finished it would rank with Hissarlik, Tiryns and Mycenæ.

THE ORDNANCE SURVEY.

THE report of the progress of the Ordnance Survey up to March 31, 1898, has been issued as a Parliamentary Blue Book. Dealing first with England and Wales, the report states that the publication of the revision of the cadastral survey on the 1-2,500 scale is proceeding as rapidly as possible, the total area published being 9,236 square miles, of which 5,217 square miles have been published during the year. The revision has now been taken up of all the counties of England and Wales which were surveyed more than twenty years ago. The publication of the revised maps on the 6-inch scale has been hitherto much retarded by the publication of the new maps on this scale of London and the Tyneside towns. This latter work is, however, now approaching completion, and more rapid progress is expected in future. The total area on this scale published is 3,788 square miles, of which 3,609 square miles have been published during the year. With regard to the revision of the 1-inch map, which was sanctioned by the Treasury in 1893, the report states that the fieldwork of the revision was begun in 1893, since when the whole of England and Wales has been revised on the ground with the exception of a few streets in the midland counties and North Wales, which will be completed this year. Of a total area of 58,527 square miles thus revised 14,643 have been revised during the year. The revised maps of 28,305 square miles have been engraved and published, 5,282 during the year. The general result to be obtained by the revision is that in 1899 there will be available to the public for the first time a 1-inch outline map of the whole of the country, prepared on one uniform system, and with its principal details nearly up to date. It is further stated that the revision of the map in the scale of 4 inches to the mile will follow on that of the 1-inch map, but cannot proceed very rapidly until the latter has been completed. After giving some details with regard to Scotland and Ireland, the report, in a summary and tabular statement of progress for 1897-98, shows that, so far as the original surveys of the United Kingdom are concerned, the town surveys for Great Britain and Ireland, the 1-2,500 maps for Great Britain, the 6-inch maps and the 1-inch maps for Great Britain and Ireland have all been completed, while the hill engraving for the new series 1-inch map of England and Wales is proceeding, 4,262 square miles out of a total of 27,569 published on March 31, 1898, having been published in 1897-98. Considerable work has also been accomplished in the way of resurveying.

ROYAL MANCHESTER INSTITUTION.

A SPECIAL meeting of the governors of the Royal Manchester Institution was held on Monday. Mr. Thomas Worthington presided. The following report of the representatives of the Institution on the art gallery committee was presented to the meeting:—"In accordance with a resolution passed by the City Council, the art gallery committee presented a report, on December 28, in which they recommended the erection of additional galleries on land behind the present building. Before this scheme could be discussed in the Council the question of building a new reference library and art gallery on the infirmary site was raised, and the consideration of the art gallery committee report has been adjourned until this other suggestion has been settled one way or the other. The committee therefore still find themselves face to face with the difficulties of entirely inadequate accommodation, which must inevitably increase, and it became a matter of serious consideration as to whether the permanent collection or the autumn exhibition should have the preference in the allotment of space, and the decision that the permanent collection must not be allowed to suffer appears to have met with general approval. With the erection of a new gallery, or the enlargement of the present galleries, the question of the appointment of an art director, which has been so repeatedly urged by your representatives, will become of paramount importance. At the close of the last autumn exhibition the committee rearranged the pictures forming the permanent collection in galleries 1 and 5, with regard, for the first time, to chronological order so far as such arrangement was compatible with the satisfactory exhibition of the individual pictures. This change, together with the purchase of several fine examples of the work of the earlier masters of the English school, has made it evident that the collection is now the most generally representative in the provinces, and there is good ground for hope that by careful purchase and discriminating gifts the collection will steadily improve in this respect. During the ensuing year the question of artistic decoration of the galleries should be considered. At present they are very dingy and unworthy of their contents. The floors are also in a bad condition and should be relaid with parquet; ventilation should also receive more attention."

Mr. C. J. Pooley said that little progress had been made during the year towards the erection of a new gallery, but the Corporation had admitted the necessity, and he believed that ultimately it would be carried out. The difficulty of the moment seemed to be the question of the infirmary site. There seemed to be still a feeling that the infirmary site might be secured by the Corporation for municipal buildings, and the free library committee and art gallery committee had been requested to defer further action until the infirmary question was settled. He hoped it would be decided within the next three or four months. It was certainly desirable that some good site should be secured in Manchester for a new art gallery and free library, and that it should be in a central and prominent position. Although they had many fine buildings, such as the post office and the new technical school, they were all put out of the way in holes and corners, and visitors to the city did not even see them. Therefore it was important that the new building should be placed in a public position. It occurred to him to ask the question, even supposing the infirmary site to be available, whether the Corporation should not create a new centre. They saw that done at Paris, Brussels, Amsterdam and other places, where the authorities struck out such centres right away from the existing ones. In Manchester nothing of the sort had been done, and it seemed to him that there were, for instance, blocks of buildings reaching from one side of Oxford Road to Piccadilly up to the infirmary which were available at a cheap rate, and there was some splendid back land to be had in Oxford Street. Mr. Pooley referred to the need of consolidation of the art work of the Corporation. The art gallery committee had intended holding an exhibition of water-colours in the spring, but the chairman of the parks committee told them that the Queen's Park committee always held one in the spring: the art gallery committee withdrew, and allowed the Queen's Park authorities to have their own way. He mentioned this to show the ridiculous position in which the art gallery committee now stood. There were the art gallery committee, the Queen's Park Museum, the collection connected with the School of Art and the Ancoats Museum. If these could be consolidated and a competent gentleman appointed as director or keeper it would be a great improvement. The cost, too, he maintained, would not be great. Manchester was ahead of London in paving, lighting and certainly in water supply, and yet they were behind, not only London, but Glasgow and Birmingham and Nottingham in this matter of art. They were at present working with superseded machinery. The question of the consolidation of the art work of the city was of the first importance, and he looked to the Corporation to take the matter seriously in hand. It was sure to come sooner or later; he hoped it would be sooner.

The report was adopted.

The following were afterwards nominated representatives of the Institution on the art gallery committee of the Corporation:—Mr. Thomas Worthington, Mr. C. J. Pooley, Mr. H. P. Greg, Mr. J. D. Milne, Mr. E. Salomons, Mr. Louis Schwabe and Mr. J. Ernest Phythian.

THE CHARTERHOUSE.

ON Saturday last the members of the London and Middlesex Archæological Society visited the Charterhouse, where the master, the Rev. W. Haig-Brown, LL.D., read a paper on the history of the foundation. From the doctor's remarks, says the *City Press*, it appears that this history divides itself into three periods—the monastery, the mansion and the hospital periods. It was in 1361 that the building of the monastery was begun by Michael de Northburgh, Bishop of London, and Sir Walter de Manny. The site was a piece of ground just outside the City walls, a sort of "no man's land," part of which in 1348 had been used as a burial-ground for victims of one of the pestilences that were frequent in those days. The house when complete was inhabited by Carthusian monks, and was named after La Chartreuse, in Savoy, the word Charterhouse being merely an English corruption of the French title. The monasteries of this order usually consisted of two cloisters, large and small, and in the case of the Charterhouse the large cloister occupied the site of the present school playground. It has now entirely disappeared, but the entrance to the prior's cell still remains, and a portion of the original chapel is also to be seen. Another interesting remnant of the past is the pair of solid gates that still hang in the chief entrance, whilst the large Guesten Hall, or dining-hall, dates back to the sixteenth century. Whilst discussing the habits of the monks who originally dwelt here, the Master observed that they were strict vegetarians, although they did not enforce abstinence from flesh food upon their visitors. Their guests, however, were entertained in a special part of the premises called "Little Egypt," a humorous allusion to the hankering after the "flesh pots" that once prevailed among the Israelites. Sir Walter de Manny did not long survive the erection of the monastery, which in 1537 passed, with its revenue, to King Harry, who in 1545 granted it to Sir Edward, afterwards Lord North. Subsequently the premises were converted into a nobleman's residence, one of the changes effected to secure that end being the sweeping away of the cloister and the cells of the twenty-five monks. This little cloister, with its Guesten Hall, kitchens and other commodious rooms, was readily adapted to its new purpose, and it still remains, the ancient character of this part of the premises being, however, hidden behind a modern "skin" of brick, erected towards the end of the last century to preserve the original stonework. In 1565 the Duke of Norfolk purchased the place for 2,500*l.*, and spent a large sum of money on improving it, and much of what he accomplished, notably the minstrels' gallery in the dining-hall, is still to be seen. The duke, however, like Sir Walter de Manny, did not long enjoy the house he had beautified, for in 1572 he was executed for high treason. In 1611 the property was bought by Mr. Thomas Sutton for 13,000*l.*, and henceforward the place was neither a mansion nor a monastery, but a hospital, or a shelter for the aged, and a school for the young. This Thomas Sutton appears to have been a very prosperous merchant and financier; and, in referring to the latter aspect of his career, the Master mentioned that it was not at all unlikely that the start of the Spanish Armada was delayed for three weeks whilst Sutton negotiated a loan with the Spaniards, the hindrance playing an important part in the history of this country in that when the mighty fleet did set out for these shores it encountered the disastrous storm which helped British pluck to annihilate the invaders. This tradition was one that Dr. Brown said he much cherished. The first object of the institution was to furnish a comfortable home for eighty men in the decline of life who had failed to provide it for themselves, and the second object was to feed, clothe and educate forty poor boys, who, without such assistance, would be likely to go untaught. Provision was made to the effect that as the revenues increased the number of the men and boys should likewise do so. Sixteen governors were appointed, and since 1611 the list has included a goodly array of princes, archbishops, peers, judges, prime ministers and other men of national fame. Minute regulations were not laid down by the founder, and much was left to the discretion of the governors who now, as before, nominated pensioners for the benefits of the foundation. In regard to the boys nomination had ceased, and entrance was now only by competitive examination. In 1872, to bring the history of the place to a close, the number of boys had grown so extensively that removal was necessary, and a site was procured at Godalming, where the school now flourishes. The old site was bought by the Merchant Taylors' Company as a new home for their school in Suffolk Lane.

ARCHITECTURAL ASSOCIATION OF IRELAND.

ON Tuesday the opening meeting of the session of the Architectural Association of Ireland was held in the Grosvenor Hotel, Dublin.

Mr. J. Howard Pentland, R.H.A., presided, and delivered an address on "The New Architect, his Work and Registration." He pointed out that, having regard to modern developments, the necessity for definite views on the general position of architects, the corelation of art, science and business in their calling, and the necessity of legislative protection both for themselves and the public, was of growing importance. Referring to the contention of the Academy party in the *Times* controversy of 1891, that art was of too elusive and ethereal a character for the hall-marks of the Architects' and Engineers' Bill, and that an architect was such in virtue of his artistic and not of his scientific ability, he inquired whether, leaving the various studentships out of account, the letters "R.A." did not constitute a diploma, and whether these very academicians did not hold every spring a great competitive examination in Piccadilly, when not only was the palm of place awarded, but the appreciation was tempered with the finer distinction of "sky" or "line." These people forget that if art could not be weighed in the balances, taste sank to preference, criticism to dialectics, and the Grand Prix de Rome to an empty honour. He then took up the other contention, and showed by an appeal to history and criticism that architecture was unthinkable without science, and that it was difficult to realise who was the greater fool—the man who looked down on construction from the pinnacle of art, or on art from the pinnacle of construction. He went on to refer to the general nature of art, and architectural art in particular, pointing out that as a matter of æsthetics alone architecture was the material expression of a want beautifully satisfied, and as such included not only engineering, but pottery, jewellery and even tailoring and millinery; that men like Michael Angelo were architects, engineers, goldsmiths and most probably designed some of the dress of their day for ceremonies, if not for every-day life. As time went on division of labour became necessary. No man could be such an Admirable Crichton as to excel in all these things, and master the gamut of the underlying sciences that inspired them. Things were, therefore, as we found them, and it was no wonder that with the views of architecture that resulted from philosophical and æsthetic considerations, and the work of architects in past ages, the exact limits of the business of the new architect should be a matter involving some doubt. The social and physical conditions arising from modern progress that guided his thought and pencil at any moment were as different from the simple requirements of old times as a turret ship from a trireme. But it was the same at the other end of the line; the mechanical engineer had to turn out Pullman drawing-room cars with elaborate architectural interiors. How was any one man to embrace in his constitution the varied experiences and aptitudes of science and art that were demanded by the necessity of a perfect result? One man had to be responsible for the whole, and that man, whether the work was a cathedral, a lunatic asylum, a yacht, or a turret ship, should be the man who knew most about the general run of the work involved. As the engineer provided himself with good architectural draughtsmen for architectural guidance in cases where engineering work prevailed, so should the architect provide himself with good engineering draughtsmen for engineering guidance when architectural work prevailed. In short, the designer should fit the aggregate of the work he had to do, and supplement the gaps in his experience by the aid of experts in art or science. Trade is conducted on similar lines, and professions and arts must follow suit. He did not deny that in many cases independent co-operation might offer a solution, but he was dealing with ordinary work-a-day experience; there were some men who were capable of dealing personally with all the problems, scientific or architectural, presented, say, by a big modern hotel, others shone more in one branch than another, but the power to assimilate advice and so produce an equally balanced result was one that grew with experience, and coupled with the study and experience of the administrative aspects of those branches of work where special temporary assistants became advisable constituted the most satisfactory means of dealing with a difficult problem. The necessity of one man being responsible for a whole had to be carried out even when co-operation was deemed advisable. No lay individual or body was, of course, capable of dealing with a number of experts employed to produce one efficient result, but in such cases consulting architects or engineers were employed as intermediaries, and the question was reduced to very much the same lines as before, the head of the office being replaced by the consulting architect or engineer and his various assistants by the independent experts employed. He finally advocated a more systematic system of education in the principles at least of steam, hydraulic and electric engineering, so far as office administration was concerned, for in no other way could one hope that the modern structures, whose very veins, nerves and sinews these things constituted, could be artistic and efficient wholes.

Mr. Thomas Drew proposed a vote of thanks to the president, and Sir George Moyers seconded the motion.

Mr. Kaye Parry said undoubtedly one of the great difficulties with which they would be beset in the future was the multiplicity of branches of his profession in which the architect would be expected to be versed. As to the suggestion that specialists should be called in by him temporarily, there would unquestionably be difficulties in the way of such a system, but he thought that the architect of the future would have to be a consulting architect to generally direct the general plan and be assisted in the various branches of his work by specialists in their different departments.

THE CATALOGUE OF NATIONAL PORTRAITS.

THE following additional letter from Mr. Julian Marshall has appeared:—

In my first letter on this subject I was careful to say nothing which could be construed as reflecting in any way upon Mr. W. H. J. Weale, the late keeper of the Art Library. His letter, dated October 11, professes to be a reply to my statements about him. It is in reality nothing of the kind. It is simply supplemental evidence volunteered by him in defence of the finding of the select committee—evidence which he did not think fit to give while the committee was sitting, when it could have been properly tested, and its allegations, if necessary, could have been met. Mr. Weale is, of course, entitled to champion the cause of the select committee, but hardly to do so by bringing forward fresh evidence which he withheld from them while they were sitting. One is forcibly reminded of a certain affaire which is now agitating our neighbours across the Channel. A man is condemned on evidence which is unsatisfactory and insufficient. On the conviction being challenged supplemental evidence is produced *ex parte* to prove that the judgment was righteous. This is not the way in which we usually do things in England.

As regards the substance of Mr. Weale's letter, I think it is greatly to be regretted that he should have come forward, quite unnecessarily, to make a charge of the gravest possible character against the late Sir Philip Cunliffe Owen, who was formerly the director of the Art Museum, but who is now unfortunately dead. It is difficult to reconcile the course taken by Mr. Weale with his professed desire to avoid personalities. As to the charge itself, I totally disbelieve that Sir Philip C. Owen ever intended to suggest to Mr. Weale that, by recommending me for employment, he would "make an influential friend of Sir John Donnelly." Sir Philip C. Owen was not the man to resort to a means of persuasion so dishonourable. Moreover, such a suggestion, besides being disgraceful, would have been extremely foolish. It could not have mattered a straw to Mr. Weale (who at the time was bound by the service rules to retire from his office in a little over two years) whether he gained the friendship of Sir John Donnelly or not. Mr. Weale, I am satisfied, must have been wholly mistaken in the inferences which he drew from the expressions used by Sir Philip C. Owen in the course of their conversation.

Mr. Weale appears to doubt whether I am entitled to be regarded as an expert in prints. Let me refresh his memory by referring him to his own recommendation, dated February 22, 1892, which ran as follows:—

"Director,—In May last I reported to you as to the necessity of a catalogue résumé of the prints in the Art Library. I have had slips prepared of those as to which we have sufficient information, and have had to set aside those—chiefly Italian engravings and German and French woodcuts—which no one on my staff has sufficient knowledge to class and describe correctly. I should be glad now to have for these the assistance of an expert, and beg to recommend that Mr. Julian Marshall be asked to devote thirty days to the work."

Lord Balcarres thinks that it was for me to tender myself, not only once but repeatedly, as a witness before the select committee, if I wished to give evidence. Unfortunately I have not the gift of prescience, and I could not anticipate that the committee would deal with me as unfairly as they have done. Allow me to say that nothing like thirty or forty volumes of the "Dictionary of National Biography" had appeared when I wrote the short biographies; I should say not half that number.

EDINBURGH ARCHITECTURAL SOCIETY.

THIS Society met on the 19th inst., Mr. W. N. Cumming in the chair, when Mr. P. E. Nobbs read a paper on "Wrought-iron Work." The meeting took place in the workshop of Messrs. Houston & Stewart, smiths, Dundee Street, and a practical illustration formed part of the evening's work. Mr. Kinross, the honorary president, and others took part in the discussion, and the attendance was a large and appreciative one.

NOTES AND COMMENTS.

Mr. William Scott, the architect, who for some years resided in Venice, has transferred his business to Bordighera. He has taken advantage of the opportunities around him to write a book on "Rock Villages of the Riviera," which will be illustrated with dainty drawings from his pen. The book will deal with some of those picturesque and out-of-the-way hamlets which visitors to the South may have seen perched on hill-tops or hidden in the valleys, away from the beaten track of tourists. The district referred to is that part of Liguria which commences at the French frontier, and a brief historical outline traces the origin and development of these little "ville," as they were called, from the early days of the Genoese Republic, through the interesting period when some of them, revolting from the oppression of Ventimiglia, formed the "Community of the Otto Luoghi," and proceeded to carry out their ideas of Home Rule. Several of the villages still possess a number of their old documents, account books and other records, and these are now laid under contribution for the first time.

One of the last official acts of M. Puvis de Chavannes as president of the Society of French Artists was to write, with M. Jean Paul Laurens, the president of the Salon, in explaining the grounds of their opposition to the arrangements for the display of French pictures in the palace of the exhibition of 1900. It was alleged that the artists demanded an excessive amount of wall-space. But the Presidents of the rival Societies in reality sought for less than was required in 1855. In the international exhibition of that year there were 1,832 French paintings shown, the foreign pictures numbering 1,193. All that was demanded from the direction of the exhibition of 1900 was provision for displaying 1,800 pictures. That figure cannot be considered as excessive, especially as the number of works which are sent in annually to the Salon is at least 3,000. It is worth knowing that Great Britain in 1855 was able to introduce 232 paintings, and had therefore the largest number of any of the foreign States. Belgium was represented by 206 pictures. The value of the British works was estimated at 130,000*l*. Out of the hundred artists who sustained British art on that occasion, Mr. Holman Hunt, Mr. Horsley and Mr. Cooper appear to be the only survivors.

Although it is not above 15 miles from Venice, the ancient town of Treviso is not much visited. It contains some interesting buildings. One is the Palazzo dei Trecento, which has just been restored at the cost of the town and communes. It dates from 1184 and is Romanesque in style. The palace has suffered much during the century. A fine external staircase was removed, windows were disfigured, and so much vandalism was perpetrated throughout that the restoration was a costly undertaking. A great many booths which were attached to the building have been removed. On the south side, where various armorial bearings appeared, a fresco representing a winged lion was discovered, and it also has been restored. Within the building is an assembly-hall about 30 feet high. This part will shortly be put in the hands of the restorers, and it is anticipated that several frescoes may be found when the walls are cleaned.

Over twenty-two centuries have elapsed since at Chæronea a dishonest victory was won by Philip of Macedon and the independence of Greece came to an end. A colossal lion was erected as a memorial. When it was discovered it was within an earthen tumulus. There is a tradition it was entire, but in the early part of the century it was broken up by gunpowder because a hollow sound was heard when it was struck, and the Greeks supposed there must be treasure concealed within it. The German archæologists have long been desirous to set up the lion. Recently they sent some skilled men to report on the feasibility of the undertaking. The operations will not be easily performed. Originally three colossal blocks were employed for the figure. But in order to convey them to Chæronea it was decided to remove as much of the marble as possible. Whether in the transit or when the lion was overthrown, the marble was cracked in several places, but the blocks are still so heavy they cannot be raised and fixed without much difficulty. What remains of the pedestal is now of such soft material as to be unsuitable to sustain a weight. What decision will be arrived at cannot be anticipated, but the lion cannot be restored for a small sum of money.

The volume on the "Architecture of the Renaissance in Italy," by Mr. W. J. Anderson (B. T. Batsford), must have supplied a need, for it is not common for a second edition of a work of the class to be called for in two years. The author does not accept his success with self-satisfaction, for he expresses a wish to see it in a different form, and was inclined to rewrite the whole or large portions, but he has most carefully revised the pages, a process which in this case has involved a good deal of expense. The number of pages is increased, and there are several new collotype and other illustrations. In some cases larger views are substituted, and in others the views are from different standpoints. Where so much anxiety is shown to improve a book it is interesting to follow the changes and endeavour to make out why they were necessary. On that account the first edition is not entirely superseded by the second, and a comparison of the two will repay the student. The author's theory, it will be remembered, is that the Renaissance does not begin with any determinate year. Mr. Anderson believes in continuity as a principle, and in his first edition he said there was a recurrence of the "type" for some two thousand years. The author now assumes the period to be three thousand. The historical architecture of Europe is, he says, an undivided whole to this day, having commenced in Mycenæ. Interesting as is the Italian variety from its limitation in area, "it must have an incompleteness of character and a littleness of design in relation to the whole." We thus see that Mr. Anderson departs from the usual plan of authors and does not overvalue the importance or interest of his subject. But he has demonstrated that the variations of Renaissance architecture have more philosophical interest than was allowed by lovers of Greek and Gothic, and he has treated the subject with a freshness which makes the subject more interesting than the average novel.

In last May proceedings were taken by the County Council at the Guildhall Police Court in respect of openings having been illegally made in the party wall between 45A and 46A Basinghall Street and 4 London Wall Avenue. The alderman decided that the buildings came within the exemption specified in section 77 (1) of the London Building Act, 1894, which states that buildings shall not be united except where they are wholly in one occupation or are constructed or adapted to be so. The summonses were therefore dismissed, the alderman, however, expressing his willingness to state a case. The Building Act committee are advised that it is questionable whether the alderman rightly construed the words "or are constructed or adapted to be so," and as the question of the irregular uniting of buildings is a very important one on account of fire risks, and is constantly arising, it is desirable that an authoritative decision should be obtained upon the point raised. A case for the opinion of the High Court has been stated as to whether the words in the section of the Act referred to bear the interpretation he has placed upon them. The solicitor to the County Council has been instructed to take the necessary steps for obtaining the decision of the High Court upon it.

CATHEDRAL SERIES.—ST. ALBANS: LOOKING ACROSS NAVE.

EASTCOTE, PINNER.

ST. GEORGE'S CHURCH, STOCKPORT.

ST. ALBANS CATHEDRAL.

IN an article on St. Albans Cathedral which appeared last week we referred to the condition of the building before the restoration was undertaken. The following copy of the report addressed to Earl Verulam by the late Sir Gilbert Scott in 1872 will explain what was then proposed to be carried out :—

The injuries which the building has sustained may be classed under the following heads :—

(a) *The deterioration of its design during the latter part of the Middle Ages and the earlier portion of the succeeding period, mainly arising from decay in taste and artistic sentiment.*

Under this head may be enumerated—1. The removal of all the high-pitched roofs, whether of the clerestories or aisles. The latter included the lowering of the walls which sustained the original aisle-roofs, and the exposure to external view of the backs of the Norman triforia, which were thus converted into windows. Nothing could tend more than these alterations to the reduction of the dignity of the external aspect of the building. Unfortunately, the correction of this defect seems so formidable a work that one scarcely feels to have courage to propose it. 2. The alteration of the great windows, both of the western and of the transept fronts, from their early forms into huge Perpendicular windows—an alteration which it seems equally hopeless to correct.

(b) *The ruthless mutilation of ancient features, which is more or less observable throughout the church*, and may in most instances be repaired.

(c) *The loss of ancient features by structural failure*, such as that which has ruined the two side portals of the west front, and damaged the central portal. These losses could be remedied, subject to a certain amount of conjectural restoration.

(d) *The natural course of decay, whether of stonework, timber, lead covering, or other parts.* This class of defect is very extensive, and demands throughout effectual remedy.

(e) *Actual structural failure, threatening the safety of the building.* Of this the most marked instance is that which has been recently detected in the central tower. This is of a very serious nature, and has happily been discovered in time, and effectual means taken to arrest it, or most serious consequences might have resulted.

One of the most conspicuous and barbarous injuries which the church has sustained is the cutting off of its beautiful eastern chapels, a large portion of which has been rendered little better than a ruin, while a public footway has been cut directly through it. No attempt at restoration will be worth the name unless this monstrous piece of vandalism be obliterated. Indeed, I think that, after providing for actual structural safety, this should be the first work undertaken, as the continuance of such a state of things is a public disgrace. Happily, the way has been prepared for this by the restitution to the church of the lady chapel, so long made use of as a grammar-school.

The next step must be the stopping of the footway, which passes directly through one of the most beautiful portions of the church, after which the restoration of these exquisite but ruinous chapels may be proceeded with, while the arches which once united them to the church may be reopened. These walled-up arches will probably be found to be perfect mines of antiquarian wealth. Some portions of them, already partially cleared by Dr. Nicholson, yielded a rich return of architectural detail, including a considerable part of the marble substructure of the shrine of St. Alban—as charming fragments of ancient carving as can well be conceived ; and we may hope that the mine is far from being exhausted. Be this as it may, the opening out of these long-closed arches will add to the church features of startling beauty such as one now hardly imagines.

The lady chapel itself is at present shut off from the intervening chapels, and the opening out of the arch which formed its entrance will add yet another element of internal beauty. This arch was closed only by an open oak screen, of which the remains still exist. The lady chapel itself is in far better condition than those which united it with the church, but it requires very extensive restoration. The beautiful wall-arcading which occupied the lower part of its walls has in a great measure been cut away ; the vaulting, which, like those of the outer chapels and that of the choir, was of oak, enriched with decorative painting, is now covered by plaster, while its woodwork is much decayed, and other architectural features are sadly mutilated. All these must be fully restored.

The central part of the outer chapels has been originally planned to be divided into three spans, by two additional ranges of columns, something as the lady chapel at Salisbury ; but this plan was abandoned, and the whole covered by a richly-panelled ceiling of oak, now sadly ruined. This ceiling must be restored, and the evidences of the change of plan left apparent. The ruin and dilapidation of these outer chapels is most distressing. Exposed for centuries to the weather, beating through the unglazed windows and the gangways cut through the walls, and used partly for a public thoroughfare and partly as a sort of playground for the boys of the grammar school, who have age after age amused themselves by cutting the soft stone of its beautiful arcading with their knives, these chapels have been reduced to a most melancholy wreck ; yet enough remains to show them to have been works of the highest art, and happily enough also to guide their restoration —a work of love and piety which will be richly repaid by the result.

If we turn our attention for a moment from the eastern to the western extremity of the church, we shall find a somewhat parallel demand for the restoration of exquisite architectural features now nearly lost through their dilapidations. I refer to the three western portals, to which I have more than once alluded. These were deep porches, approached externally by rich and lofty arches and surmounted by high gables, parallel in many respects to the portals of French cathedrals. Unhappily their fronts at some period gave way. That of the central portal was replaced by a plain arch of a late period, but those of the side portals were simply walled up ; so that externally these exquisite features are now wholly obliterated, while within they form mere closets, in which fragments of sculptured stone are stowed away. At the risk of having to exercise some degree of conjecture, I think that these portals should be opened out and restored ; and I feel confident that in the walls by which they are now blocked up evidences will be found to aid greatly in the work of restoration. It is, indeed, evident that these walls are composed largely of the moulded fragments of the fallen fronts. These portals were built from a level lower than that of the nave, intending to rise by several steps from the first to the second internal bay. This beautiful arrangement was either abandoned or altered, and the consequence is that the lower portions of the portals, as well as of many adjoining parts, are now buried some 2 feet beneath the floor. This must be corrected, and their forms brought out in their noble integrity.

Another case of restoring lost features strikes the eye at once on entering from the west. I refer to the lost vaulting of the greater part of the aisles of the nave. Of twenty-six bays of the aisles eight only retain their vaulting ; three of them Norman and five of the fourteenth century. Eighteen require to be revaulted ; nine of them Norman and nine Early English.

Somewhat parallel in class are some extensive restorations required in the interior of the choir, where, besides the cutting away of the shafts of piers and other architectural details, some very important features have been wholly removed, consisting of beautiful tabernacle-work projecting over two doorways (themselves now obliterated) on either side. I some years back discovered nearly all the parts of one of these beautiful projections and succeeded in getting them fitted together, and their materials are still preserved. Many minor cases of the same kind occur throughout the church which it would be tedious here to enumerate.

The most serious structural defect in the building is that already referred to in the central tower, of which the two eastern piers have shown signs both of subsidence and of actual crushing. The failure of the north-eastern pier extends into the choir and is shared in a less degree by the east side of the adjoining transept. So pressing was the danger that signs of increased subsidence showed themselves while the parts which first showed evidence of failure were under repair. Very active measures were at once taken by the application of powerful shoring, followed up by the restitution of the piers of large portions which had long since been cut away from them, and the piers themselves have been greatly strengthened by the substitution of sound for disintegrated material—a difficult and anxious operation. The foundations of these piers have been a good deal weakened by the proximity of graves ; and, strange to say, the southern pier had apparently been excavated beneath the floor into a sort of cave, so far as we can judge, with a view to the destruction of the tower. The repairs already undertaken are only such as immediate security demanded, but there remain very extensive dilapidations in the tower throughout its entire height, all of which must be thoroughly and substantially repaired or it cannot be pronounced safe. Its tendency northwards both increases and is increased by a corresponding tendency in the north transept, which is clearly settling in that direction and is much cracked. This also demands a decided remedy.

The decay of material externally is very extensive. The Norman walls are free enough from this, having no stonework about them ; but the later portions have everywhere their architectural features carried out in the soft church-stone of Totternhoe—a material which, though suitable enough internally, is far from durable for external work. The consequence is that throughout the more architectural parts of the building sad havoc has been made by time and the elements. This is especially the case with the long ranges of clerestory windows to the nave, which are shattered in a most lamentable manner, and their ruin is increasing every winter. The old parapets erected of this material have almost wholly perished and been

replaced by brick, and every part which has stone dressings externally shows more or less the sad effects of the use of this perishable stone. In renewing these shattered details I should endeavour to find a durable material which would correspond in colour with the old stone, and this, I think, we have in the Chilmark quarries in Wiltshire, from which Salisbury Cathedral was erected.

The timbers of the roofs and ceilings also demand careful reparation. This is especially the case with the ceilings, which are everywhere very much decayed and are getting actually unsafe. The lead covering also requires careful reparation throughout and renewal in some parts; as a rule it has been carefully attended to, but as it greatly exceeds an acre in extent this alone is a work of importance. The plastering and stonework of the interior require to be carefully freed from whitewash. This has already been effected in many parts with a happy effect under the direction of Dr. Nicholson, bringing to view the beautiful and most interesting coloured decorations of the old wall surfaces.

Every Norman pier on the north side of the nave is found to have an altar painting on its western side forming a sort of reredos to the small altar erected against each. These paintings all represent the Crucifixion and are most valuable specimens of early art. The simple operation of taking off whitewash from surfaces so prodigiously extensive and doing it with such care and tenderness as not to disturb the painting beneath, is a work of considerable cost. If we had succeeded in enumerating all the manifest defects of the structure, which would be a wearisome catalogue, the fact still remains that the minor reparations of a building of such enormous extent still form, by the vastness of the surfaces over which it is spread, a formidable and costly undertaking.

To avoid tedious details which would encumber without elucidating my report, I will accompany it by a rough specification of the leading items of reparation I recommend. It will be seen that I have not calculated anything for internal fittings nor for the detached objects such as tombs, screens, &c., having limited myself to the repairs of the actual structure, with its roofs, walls and floors. My leading object in the treatment I have calculated on has been to insure the perpetuity of the structure and to guard against the loss of any of its architecture, but to do this with the smallest possible change in its general aspect, such changes being limited to the restoration of such lost features as are essential to its character, especially as viewed from within.

No church in Great Britain more thoroughly deserves a careful and conservative restoration, nor would any more richly repay this labour of love. It is a glorious work and one with which I feel a special pride in being connected, and I most earnestly wish you every possible success and liberal support in what may fairly be styled a great national undertaking.

GLASGOW ARCHITECTURAL ASSOCIATION.

AT a meeting of this Association on the 18th inst., Mr. John Fairweather, vice-president, in the chair, a lecture was delivered by Mr. Low, his subject being "Ventilation." The lecturer pointed out how closely the sciences of heating and ventilation were allied. They could not very well be treated separately. Questions regarding the quantity of air required, the cubic space of room necessary per person and the necessary purity of air fit for breathing were gone into closely and clearly. Although carbonic acid gas was an impurity, it was more the presence of organic matter that rendered air unfit for breathing. One of the greatest difficulties ventilating engineers had to contend with was the difficulty of ventilating comparatively small rooms without causing a draught, and this no matter what system was adopted. There were many different systems, but they could all be grouped under either of the headings "natural" or "mechanical." Mechanical methods, again, could be subdivided into plenum and vacuum. Mr. Low described each system in turn, referring to different buildings ventilated by each method. The natural system was illustrated by several very interesting experiments made with a small model of a room. The failure of cowls as foul air extractors was pointed out. The whole series of experiments tended to show how difficult and uncertain natural ventilation was under certain conditions and circumstances. On the motion of the chairman, a hearty vote of thanks was accorded Mr. Low for his interesting paper.

The Opening Meeting of the Dundee Institute of Architecture, Science and Art will take the form of a dinner, on or about November 17 next. The probable dates of the other meetings of the session will be January 12, February 9 and April 20.

ST. MARY REDCLIFFE, BRISTOL.

(Concluded from last week.)

ON comparing the roof of the transepts with that of the chancel we shall find much in common both in design and enrichments, which leads to the inference that the latter was constructed very soon after the former, and from a plan furnished by the same architect. The period of the erection of this part of the superstructure should be placed not later than 1410, and my reason for doing so is that the arch dividing the chancel from the transepts, and which continues throughout the entire nave, for the sake of uniformity as it would seem, so far declines from the perfection of that architectural member as to leave no doubt that it was erected soon after the Perpendicular style had obtained permanence as a national mode o. building, that is, at the commencement of the fifteenth century. By dividing the horizontal line at the base into eight parts, the centre of this arch will be found at the seventh.

We have no means of knowing by whom the superstructures of the chancel and transepts were designed, particularly the latter on the north side of the church, but there is sufficient evidence in the vaulting to show that they were the work of one presiding genius, and that he was employed to superintend the erection of the entire of these parts of the structure above the first stage, from about the death of the first William Canynges, until the close of the first ten years of the following century. From about that time another architect was employed, and to him is to be ascribed the design of the elaborate vaulting which so enriches the nave of this beautiful church; but the name of this architect, like that of his predecessors, is entirely unknown to us.

The completion of so elaborate a superstructure as that of the nave must have occupied a longer period than the erection of any other part of the interior. It is by far the most costly portion of the entire fabric, and displays an example of decorative excellence scarcely to be paralleled. The space between the arches above the first stage of the building and the clerestory windows is filled with Perpendicular English panelling, as also is the same space in the north transept and chancel, that in the south transept only being designed in the Decorated style. The clerestory windows which rise above are uniform in structure throughout the entire nave, chancel and north transept, all being in the Perpendicular fashion, but those in the south transept are constructed in the style which preceded it. The screens also at the east end of the chancel and its aisles may be classed with the Perpendicular portions of the fabric, as may likewise several subordinate erections in that part of the edifice.

It can scarcely be doubted that the whole of the superstructure of the church was raised upon the work of the first William Canynges, excepting the Decorated English portions which occur in the south transept. Its progress must have been slow from want of sufficient funds, for in those days of patents, licenses, monopolies and charters, the wealth of provincial towns was confined chiefly to the mercantile few, to the comparative exclusion of the trading many; contributions therefore could be obtained for the most part from those only who were so favoured, and of course the work was more or less retarded in consequence. The completion of the church was probably far from accomplished when, as we find it recorded in a manuscript cited both by Barrett and Britton, with a difference of one year in the date, "Anno 1442, William Canynges (the second of that name) wyth the helpe of others of the worshipfulle towne of Bristol, kepte masons and workmenne to edifie, repayre, cover and glaze the church of Redcliff, which his grandfather had founded in the days of Edward III."

If any reliance can be placed upon the genuineness of this document, it is evident that William Canynges, junior, was, like his grandfather and Simon de Burton, a contributor only towards completing the church, and is an additional proof that no part of the structure whatever was raised at the sole expense of any one individual; but that, with the Harringtons, Hungerfords, Cradocks, Medes, Sturtons, Dyricks, Says, Graunts, Cheneys, Fulks, Fitzwarrens, Inyns, Rivers and others among commoners, whose arms were formerly blazoned in the windows of the church as benefactors to the edifice (and some of whom have monuments still remaining there), together with the Straffords, Berkeleys, Beauchamps and Montacutes, among those of noble blood whose heraldic shields, charged with their family devices, are sculptured on the roof of the north aisle of the nave, William Canynges, junior, "wyth the helpe" of the above-named donors and "others of the worshipfulle towne of Bristol, kepte masons and workmenne to edifie" or complete all imperfect detail and embellishment; "repayre" the unfinished building of his predecessors wherever injured through the length of time occupied in its erection; "cover and glaze," that is, finish, the vaulting already in progress, roof in the church, erect the parapet and glaze the windows. These, the only incomplete parts of the structure

to the date last mentioned, are all that can with certainty be ascribed to the time of the second William Canynges, previous to the falling of the spire in 1445. If he had been more than a contributor with others to the work, surely some mention of such a circumstance would be recorded, either on the monuments erected to his memory, and still standing in the church, or that he would in his will have named a fact so remarkable, yet nothing of the kind was ever placed upon record on either memorial. What is still more strange is, that whilst by his last testament he particularly specifies a gift of "twenty pence to the mother church of Wells," directs that the "lights and torches" used at his funeral should "be given and distributed" by his executors "to twenty-four of the neighbouring parish churches without Bristol," gives to the fabric of the church of Westbury forty shillings, and a like sum to the church and tower of Compton Braynesold, no mention whatever is made of any such gift to the church of St. Mary Redcliffe, neither do we meet with the slightest notice of any donation being made by this second William Canynges towards the erection in any memorial to which the slightest importance can be attached. The inscription on a board at the back of his tomb in the south transept of the church is regarded as the composition of that well-known maker of epitaphs in the reign of Queen Elizabeth, Thomas Churchyard, and is therefore unworthy further notice.

The part undertaken by William Canynges, junior, in the completion of the church was evidently to superintend the application of the funds raised for that purpose; and Norton, whose first name is not recorded, was the "master mason" or architect employed by him to carry on the work. To the latter may be ascribed the finishing of the structure at the west end and also the portion of the spire as it long appeared, that part of the building never having been rebuilt. There can be no doubt, however, that the church was finished entirely before the fall of the spire in 1445. Referring to this unfortunate event, Mr. Barrett quotes, as he informs his readers, two "very ancient" manuscripts, which relate the fact in the following manner. The first says that in "1445, at St. Paul's tide, was very tempestuous weather, by which Redcliffe steeple was overthrown in a thunder-clap, doing great harme to the churche by the fall thereof, but by the good devotion of Mr. William Canynges it was re-edified, to his everlasting prayse.' The second document speaks thus:—"William Canynges re-edified and enlarged the church of Redcliffe, almost destroyed by lightning in 1445, in so exquisite a manner that he has ever since passed for the founder thereof, and he afterwards gave 500*l.* to keep it in repair." Mr. Britton also cites a manuscript preserved in the Bodleian Library, by which we are informed that "the said church, having suffered much in a tempest, the above-mentioned William Canynges, a celebrated merchant and public benefactor, in the year 1474 gave 500*l.* to the parishioners of Redcliffe towards repairing the church, and for the maintenance of two chaplains and two clerks in St. Mary's Chapel there and of two chantry priests." The genuine character of these manuscripts is, however, exceedingly doubtful, and for reasons already assigned when speaking of all such documents relating to old Bristol.

It will be observed that the second manuscript quoted above records in other language the particulars contained in the first, with the addition of a gift of 500*l.* "afterwards" bestowed by William Canynges towards keeping the church in repair, and the third, or Bodleian, writing, in addition to reciting the contents of the two previous papers, announces that, besides repairing the church, the 500*l.* was given also for the maintenance of two chaplains and two clerks, and gives the date of the execution of this deed so late as the year 1474. This date evidently refers to the will of William Canynges, which was executed November 12 in that year; but in this document not one word is mentioned of any such donation to the repair of the church as that above cited, nor indeed of any other sum being left for that purpose. But, admitting it to be correct, we are to believe that no measures for restoring the church were adopted between the falling of the spire in 1445 and the gift of this money in 1474, a period of nearly thirty years. Such a thing we may regard as incredible. This manuscript is in fact nothing more than a transcript in brief of the parish register (with another date) hereafter quoted, and most likely the work of Chatterton, who probably had as much access to such documents through the medium of his uncle, who was sexton of the church, as he had to those in the chests of William Canynges.

In speaking of the restoration of the edifice after the falling f the spire, Mr. Barrett says (page 570), "the same plan was observed by him (William Canynges, junior) in rebuilding and restoring it to its original beauty after being thrown down by the lightning; the south aisle, where the mischief fell heaviest, seems to have been rebuilt with a somewhat more elevated arch and in a lighter style than the north; a difference also is between the windows of the north and south aisle. The fall of such a large and very high steeple upon the church must have done great injury, and destroyed everything wherever it fell." In another place the same writer says in substance that by this accident the body of the church was so much injured that it was almost ruinous. Now both these statements cannot be correct, for in the first mention is distinctly made of the damage having been sustained by the south aisle, and in the second by the body of the church—that is, the nave. The former assertion is doubtless the correct one, and to the south aisle it may be confidently said the mischief was confined, for had the spire fallen upon the body of the edifice some indications of repair or restoration would appear in that part of the building as well as in the south aisle, but as nothing of the kind is observable we may reasonably infer that it wholly escaped the effects of the accident.

In discussing the contents of the manuscripts recently noticed it will be observed that the third refers to a gift by William Canynges, junior, of 500*l.* "towards repairing the church, and for the maintenance of two chaplains and two clerks in St. Mary's Chapel there, and of two chantry priests." In Mr. Barrett's first manuscript no mention whatever is made of this gift; but in the second quoted his remarks lead to the inference that William Canynges, junior, having repaired the church injured by the falling of the spire, "afterwards gave 500*l.* to keep it in repair." The introduction of the adverb "afterwards" seems to imply that the donation was not made then, but at a subsequent period, and it is, no doubt, the same sum of 500*l.* as that mentioned by the same author at page 612 of his work, where he records, under date of

"1466. William Canynges gave by deed for	£	s.	d.
divine offices in Redcliffe Church . . .	340	0	0
And in plate to the said church	160	0	0
Vested in the vicar and proctor of Redcliff	500	0	0."

According to this latter document, 340*l.* of the total sum was given "for divine offices in Redcliffe Church," the meaning of which is explained by an extract from a volume of the parish register for the years between 1678 and 1694 inclusive, made by Mr. Britton, and quoted in his work, page 31, in which it is expressed that William Canynges, by deed dated October 20, 1467, one year later than that stated by Barrett, "gave unto the vicar and wardens, and also to the senior and major part of all the parishioners of the church of the blessed Mary of Redcliff in Bristol, the sum of 340*l.* of current money, upon condition that the said vicar and churchwardens, and their successors for ever, should for that gift and with the said money sufficiently repair or cause to be repaired and re-edified the ruinous buildings, tenements and houses whatsoever of the said church, and with the rents and issues of the land and tenements of the same church should provide, find and give unto two chaplains, called St. Mary's priests, 9 marks a-piece per ann.; to two clerks sufficiently instructed in reading and singing, at 2*l.* 13*s.* 4*d.* a-piece; and for executing the sexton's office 1*l.* 6*s.* 8*d.* With divers other gifts, as per the record of the same deed, &c. &c."

It will not fail to strike the reader as somewhat remarkable that in the above quotation, while the repair and re-edification of "ruinous buildings, tenements and houses" belonging to the church is specially cared for by the donor, not one word is said about any repairs to, or rebuilding of, any part of the sacred edifice itself, nor is the slightest intimation given of there being any works whatever, exterior or interior, in progress. The sum of 340*l.* was therefore bestowed "to provide, find" and pay "two chaplains" and "two clerks" and "a sexton," who should properly discharge the various duties appertaining to their respective situations in the church in a becoming manner, and it evidently had no connection whatever with repairing the fabric itself, in which these different parties officiated. Of the total sum of 500*l.* there still remains 160*l.* unappropriated, and as no mention is made in any document as to the way in which this balance was disposed of, we are left to conjecture that this amount only was in reality all that the second William Canynges gave as his own personal donation towards the reconstruction of the church. How 340*l.* came to be the particular sum left "for divine offices" in the church, is accounted for by the fact that William Canynges (says the deed recorded in the parish register before quoted) had advanced 160*l.* to Sir Theobald Gorges, knight, upon some jewels (Barrett says plate, but this is an error), which the latter had placed in his hands as security for the loan of that amount, but which it would seem had never been redeemed. These valuables, therefore, with 340*l.* were presumed to make together 500*l.*, the total sum given by William Canynges in relation to the matter before us. It is worthy of remark here that in a deed formerly possessed by the late Mr. Cumberland of Bristol, and dated 1467, the sum of 340*l.* only is mentioned; and this was given to repair the dilapidated tenements belonging to two chantries in Redcliffe Church founded by Everard le Fraunceys, and to found another to be called "W. Canynges priest." If this deed could be depended on as the most truth-telling of the whole of the documents brought forward in this essay, it clearly shuts out William Canynges junior from all participation in the re-edification of the church, and leaves us to the alternative that he did not even contribute at all towards the undertaking This, however, we cannot believe, for that he gave of his sub

stance to the work there can be no doubt, although no positive record of the fact upon which we can rely is known to exist. The manuscripts noticed are of so contradictory a character as to be unworthy our credence ; and they bear so strong a general resemblance to each other and yet admit of such varied interpretations as to have the appearance at least of having been concocted for purposes of fraud and deception.

In the preceding remarks it will be seen that opinions are given which differ widely from those of all previous writers upon this subject ; yet, although they should affect the long-established fame of those to whom, by common consent, the erection of the matchless church of St. Mary has been ascribed, it were better, far better to endeavour to divest the subject of a mysticism in the dark folds of which it has for so great a length of time been enwrapped, than to echo, as most writers have done, an undisturbed tradition which has no more foundation in fact than to assert that the mist upon the mountain's top is as permanent in its duration as the "everlasting hills." "If," says Mr. Dallaway, "to investigate truth be in some instances to lessen traditional fame which has descended to our times without examination, the present age is become more interested in discovering realities and in detaching such errors from seeming authorities, which have never been submitted to the test of historic proof."

The sum of the foregoing remarks clearly establishes three important facts :—First, that tradition alone, unsupported by any documentary evidence of undoubted authority, has ascribed the founding of the church of St. Mary Redcliffe to Simon de Burton ; and that the oldest parts of the structure were erected at least forty years before that event is said to have taken place, another style of architecture being at the time in practice. Secondly, that in constructing those parts of the building usually assigned, through the same suspicious and unconfirmed medium only, to William Canynges, he was aided by the contributions of other wealthy individuals, and as a contributor alone he stands connected with the erection of any part of the structure. Thirdly, that in the examination of such documents as refer to William Canynges, jun., nothing has been discovered to justify the long-received opinion that he executed the work of reconstruction at his own sole cost, all the evidence adduced tending to prove that, like his predecessors, Simon de Burton and William Canynges, sen., he was but a contributor, and as such only, "wyth the helpe of others of the worshipfulle towne of Bristow," he finished the labours ascribed to those worthy men by employing "masons and workmenne to edifie, repayre, cover and glaze the church of Redcliffe," which had been commenced upwards of a century before the time when his grandfather flourished.

VENTILATION AND WARMING.

(*Concluded from last week.*)

Ventilation of Infirmary Wards, with Space Allowance of 850 cubic feet per Bed.

I PURPOSE first to offer some considerations respecting the ventilation of infirmary wards intended for general cases of the first class referred to in the report of the Cubic Space Commission, for which an allowance of 850 cubic feet of space is prescribed. Following the direction which I have indicated in the introduction, we may approach the consideration of the question in the following way :—Assuming that a full-sized chimney with a fire in the grate will remove 20,000 cubic feet of air per hour if freely supplied, such a chimney will provide ventilation for five beds at the rate of 4,000 cubic feet of air per bed per hour. A five-bed ward at 850 cubic feet per bed would be approximately represented by a ward 21 feet long, 20 feet wide and 10 feet high. The air supplying the chimney would clearly come in cold and almost certainly cause draughts, unless some provision were made for warming it. If such provision be made by having grates with ample fresh air supply, so that the windows need at most be only very slightly opened, say at the top, a ward of the dimensions indicated would not be ill-provided as regards warming and ventilation so long as the fires were kept burning. A ward of twice the dimensions with ten beds would similarly be reasonably ventilated by two fires. These dimensions and provisions do not differ materially from those of some of the wards inspected. Except that the ducts for supplying air may want cleaning and are probably not so large as they should be, no serious objection need be argued against the arrangements of the wards in question. It is true that in taking a definite figure for the ventilation-efficiency of a full-sized chimney we are taking a single value for what in reality varies between rather wide limits according to the state of the wind and the activity of the fire, and which depends, moreover, upon the height and dimensions of the particular chimney. As a matter of fact, 20,000 cubic feet per hour is possibly a too liberal estimate of the average draught of a chimney in one of the school infirmaries, and it would be well before coming to a final decision upon the efficiency or inefficiency of the ventilation of any particular ward, to verify or amend the estimate by measuring the actual flow in the chimneys themselves ; but the figure is, I believe, within the bounds of probability, and is, indeed, probably a not more uncertain statement than the specification of 4,000 cubic feet per hour as the necessary allowance of fresh air and may, like that, be provisionally accepted for a working basis until more definite data are available.

In the computation given above no account has been taken of the effect of the gas used for lighting. This should be dealt with by providing extraction shafts above the jets, but it must be remembered that unless the inlet openings for feeding the fires with air are very ample, a down-draught through the extraction shafts is very likely to be established, which would bring the fumes of the gas down into the room. In Stevenson & Murphy's "Hygiene," vol. i., I have set out the conditions which govern the reversal of the action of an extraction shaft. It is the less likely to occur the greater the vertical height of the shaft (leaving out of account exceptional conditions of wind), and it can be avoided either by having a shaft of sufficient height without altering the inlets for air or by making the air-inlet sufficiently ample without altering the height of the shaft.

In view of the tendency to down-draught it would be very useful to have at the inner end of the shaft an index to show whether the air was going up or down. I am not aware that such an index is at present in the market, but it would be easy to construct one which could be fitted into the mouth of the shaft. It might consist of a small flag of mica attached by one edge to a horizontal axis about which it could turn freely, and lightly counterpoised so that the flag would be approximately horizontal when there was no motion of the air along the tubes. A current up the tube would then carry the flag upwards, and the reversed motion would bring it downwards ; the direction in which the air was moving could thus be identified at a glance. Such an index might be used as a criterion of the due supply of air to feed the fires by day or night. If the inlets were adjusted so that the flow of air was directed upwards in the gas-flue they would be shown thereby to be sufficient to feed the fires with the proper amount of air for ventilation ; if, on the other hand, there were down-draught, it would be desirable to open the windows or otherwise enlarge the inlets until the down-draught was reversed.

It would be equally useful and still easier to attach an indicator to the face of an extraction shaft which terminates in a vertical grating. A small square plate of paper or mica attached to a horizontal axis and nearly counterpoised forms a very sensitive indicator ; it swings towards the flue or away from it according as the air is being extracted or is passing in the reverse direction. Such indicators would be a very useful and inexpensive addition to the arrangements for ventilation.

Consideration of Certain Objections to Ventilation by Open Fires.

Supposing that the extraction of the gas fumes is satisfactorily provided for, either by special extraction shafts or by openings into smoke-flues which are not open to the objection indicated above, we may proceed to consider some further points in connection with the use of open fires as a basis of a system of ventilation and warming of infirmary wards of the first kind. The suggestion to regard the ventilation and warming as depending exclusively upon open fires, even with the proviso that the number of patients is suitably limited, has to face the objection that open-fire warming is dusty, and, according to Carnelley, has generally associated with it a large number of micro-organisms in the air. If the inlets to the backs of the grates be large enough, it is an easy matter to supply them with filters to abstract much of the dust from the incoming air, but the schools are almost without exception favourably situated in open country; their air supply is free from injurious dust, and special precautions need not be taken to deal with it. The dust that accumulates in large quantities in the schools. in any place that is left undisturbed for a length of time is a product of the interior, and probably little of it comes in with the air supply. A hospital ward, too, must be regarded as in itself a nursery of pernicious micro-organisms, and such as come in with the air from outside are, comparatively speaking, harmless and few.

Of course the ventilation of infirmary wards by open fires requires the constant and intelligent care and attention of those in charge, in order to secure a good result as regards both temperature and freshness throughout the vicissitudes of our climate, but I see no reason for thinking its successful management to be beyond the range of possibility, provided that the number of beds in the wards is suitably limited. One of the obvious causes of difficulty lies in the variation of temperature that ensues if the fires are allowed to go out for any considerable length of time in cold weather. In that event the chimney being warm throughout its length con-

tinues the ventilation for hours after the heating effect of the fire has practically ceased, and within the room a very cold morning may in consequence succeed a comparatively very warm evening. This difficulty constitutes a valid objection to the use of the method of combined warming and ventilation by open fires in fresh-air grates for ordinary domestic use in bedrooms, where the fire is allowed to go out many hours before the occupation of the room ceases ; the objection holds good in the case of the infirmary wards (where an equable temperature is of the first importance) unless provision can be made for keeping the fires alight throughout the night.

One other objection to the system of open fire ventilation may also be referred to, namely, the influence of the large window area that is on other grounds desirable in infirmary wards. The windows expose large portions of the air of the room directly to the cooling influence of the external air, and in very cold weather, especially on cold nights, a very large amount of heat is thus abstracted by conduction, and the effect upon the air thus chilled is that a cold stream is established descending to the floor and passing thence to the fires. Thus draughts arise, often so conspicuous as to be erroneously attributed to leakage of air through the window-frames. There is no remedy for the difficulty except the double glazing of the windows, either by doubled panes with an air-space or by double sashes. In consideration of the fact that the local circulation produced by the cold windows is an advantage if it be restricted within moderate limits, the best remedy is probably glass shutters to fold back upon the walls. They might be used only in the more extreme weather, and when not required might be folded back or removed altogether.

It is claimed for the method of mechanical ventilation (see the account of the new hospital at Birmingham, *Lancet*, 1895, vol. i. p. 1203), that if the windows of an infirmary are not opened, and all the air is passed through filters, a valuable result is secured in the exclusion of flies, with their pernicious power of carrying infection. No such claim can be advanced for the open fire system, for in the warmer weather of summer, when flies are most abundant, the ventilation will necessarily be dependent upon the windows ; in fact, when fires are not required resort must be had to the system of cross-ventilation. I am, however, informed that in certain tropical climates, where flies are much more annoying than they are in this country, it has been found that the best way of keeping them out of a room is to provide an active cross-ventilation, and that a through draught is a better protection than mosquito curtains. I cannot say how far this would apply in the case of infirmary wards, but in so far as it is applicable, it indicates a practical advantage in those wards which are so built as to provide for adequate cross-ventilation.

The most attractive feature about the use of an open fire for combined warming and ventilation in the infirmaries of the Poor Law schools is the simplicity of its action. Viewed from the point of view of saving labour in carrying coals, &c., it may not be all that could be wished for, but objection on that ground does not seem to me to be of great force in the special circumstances of the schools.

As soon as we depart from the simplicity of the open fire, and attempt to warm either partially or exclusively by other methods, other difficulties arise. When the heating is by steam or hot water separate provision must be made for ventilation, and we are met at once with the difficulty of providing sufficient and continuous motive power. The system of cross ventilation as described for dormitories can, of course, be applied in this case also, a larger allowance of heating surface being made in order to give greater elasticity in the control of the temperature, but the method seems inapplicable to the special circumstances of infirmary wards on account of the necessity for uniformity of temperature. I have supposed that in the case of dormitories considerable variations of temperature, such as may arise from sudden changes in the weather during the night, are not seriously injurious to healthy children well covered up with bed-clothes, but I should probably not be justified in making a similar assumption in the case of infirmary patients. Moreover, an occasional current of cold air across a well-ventilated dormitory may produce no ill effects upon the healthy, but the same cannot be said about the sick.

If open fire ventilation is to be supplemented or replaced, there seems indeed to be no really trustworthy alternative except the system of mechanical ventilation, under which the amount and temperature of the air supply are both kept under control and independent of the uncertainties of the wind. Experience is gradually accumulating about the system of mechanical ventilation as an exclusive method in hospitals.

Taking all these points into consideration, it seems to me to be unnecessary if we limit ourselves exclusively to wards with an allowance of 850 cubic feet per bed to make any substantial difference in the arrangements already in vogue in many of the wards where the air supply is governed by open fires and warmed by being passed round the backs of the grates. The air supply to the backs of the grates may not be sufficiently free, and that defect may have to be made up by slightly opening the windows, but where there is a fireplace to every five beds and the outlet ventilators for gas jets or in the ceiling are provided with tell-tales, the system would, I believe, give fairly satisfactory results if carefully worked. At least it would be necessary to demonstrate the inefficiency either of the warming or of the ventilation by a series of careful experiments before the expense of remodelling the system could be regarded as justified. So far, therefore, as these wards are concerned, I have only to suggest that in estimating the available accommodation, the facilities for warming and ventilation should be taken into account, and that until the average capacities of the several chimneys for removing air be determined by actual measurement, the number of beds should not exceed five per open fire. When the capacity of the chimney has been determined, the number of beds should be so limited that the supply of air for each bed should amount in ordinary weather to 4,000 cubic feet of air per hour.

There are many of the wards which approximately comply with the requirement as regards the relation between the number of open fires and the number of beds, but in which the fires are unprovided with fresh air supply. The supply of air to the wards is therefore entirely cold. I cannot regard such an arrangement as satisfactory. I am aware that high authorities on the subject of warming and ventilation are of opinion that it is practicable to introduce the air for ventilation by fine jets suitably directed and in sufficient quantity to make an adequate provision of cold air without causing cold draughts. The supply of air behind the fire, however, increases the efficiency of the grate as a warming agent, so that if with an ordinary grate a certain quantity of cold air can be mixed with the air of the room and the temperature of the room maintained at a suitable figure, it follows that more fresh air can be introduced without unduly reducing the temperature if a larger fraction of heat is devoted to warming the room. On this ground it seems to me that the grate with fresh air supply has a specific advantage over one without it, and where the system of open-fire warming is to be maintained it is desirable that grates with fresh air supply should be introduced.

Consideration of Wards with an Allowance of 500 *cubic feet per Bed.*

When the number of patients in a ward is greater than can be satisfactorily provided for as regards ventilation by the open fires introduced primarily for the sake of warming, the case is not so easily disposed of. The most direct solution of the problem, following on the same lines, would be to increase the number of grates and chimneys, and so keep undisturbed the approximate proportion of one fire to five beds, to have, that is to say, three fireplaces with fresh air supply in a ward approaching in size 10,000 cubic feet, and making where necessary an adjustment in the allowance of cubic space to keep the figures within the proportion. But there are objections to this plan. First, when the number of beds is large they cannot be satisfactorily distributed with regard to the fires; some are too close, others too far away, unless the three fires are all placed in the middle line of the room. Secondly, the provision of an additional chimney may involve considerable structural alteration, and when it is provided and there are three fires in a room of only moderate size, there is a danger of a flow of air in the chimney of one of the three being reversed when the fire gets low, and in consequence the ward may be occasionally filled with smoke. Thirdly, there is the objection based upon the following line of argument :—That if two fires are sufficient to warm the ward when there are ten patients in it, three fires will overheat it when it is occupied by fifteen patients. There is less force in the third objection if it be understood that with the third fire is to be associated the supply of 20,000 additional cubic feet of air to be warmed, but it is doubtful whether the strict proportionality between the number of fires and the corresponding supply of air could be implicitly relied on and it would surprise no one to find that, in spite of the additional openings, the three fires would overheat the ward.

For these reasons it is desirable to consider some alternative methods of supplementing the warming and ventilation of the wards in question. It may be accepted without further argument that if additional ventilation is to be provided on account of the added number of beds, some additional heating will also be required, if for no other reason, because otherwise the fresh supply of air will come in cold and cause draughts. For additional heating one naturally turns to hot-water pipes or steam pipes, and coils of pipes on opposite sides of the room with openings for air behind them are an obvious suggestion for combining ventilation with warming, but without any further provision they assort ill with the open fires having their special air supplies, and cannot be recommended. It must be remembered that the air is drawn through the channels behind the fires, because the suction of the chimneys reduces the air-pressure in the room below that of the outside. If ample

openings are made direct to the outside through the walls the chimneys cannot produce the necessary diminution of pressure, and the flow through the air channels practically ceases, or is at least very seriously diminished. In such an event the combined action becomes incalculable and the ventilation and temperature are at the mercy of a varying wind. The effect here referred to of an additional opening upon the flow through the duct of a fresh air grate can be very easily tested by opening and closing the window of any room which has such a grate, and observing the change in the flow through the ducts. Through the kindness of Dr. Hollinshed, the medical officer, I have had an opportunity of inspecting the new infirmary of the King's Norton Union (Selly Oak), in which open fires are supplemented by steam coils placed under pairs of opposite windows and enclosed by iron cupboard doors. There are openings in the walls behind the coils, and the top of the iron case has a hinged flap by which an adjustable opening for the warmed air can be made just under the windows. The extraction ventilation of the fires is also supplemented by flues in the side walls carried up the chimney-stacks or in certain cases into the roof space. Any motive power there may be in these flues would be due to warm air coming from the wards, or to wind across the tops, and its action would tend to reduce the air pressure inside the wards and thus to diminish the disturbing effect upon the air supply due to the openings alone. If the wind across the top were sufficiently brisk the disturbance might indeed be entirely obviated. The combination of extraction flues with steam coils having openings behind them is not very different in its action from that of a third chimney in which the two functions of warming and extracting air are combined, but it has the advantage over the third chimney in that the first two of the objections are obviated in its case, and the heat would be sufficiently under control to make the third objection unimportant.

If tell-tale indicators were mounted upon the gratings covering the flue openings, and the inlet openings were adjusted from time to time, as might be found necessary to secure that the extraction flues were working in the proper direction, the combination would form as satisfactory a supplement to the ventilation by open stoves as any arrangement except mechanical ventilation. The arrangements at Selly Oak are especially commendable for the facility with which the steam pipes, their cases and inlet openings can be cleaned, and also for the distribution of the extraction openings, some of which are near the floor and some near the ceiling. I venture to suggest that in cases where the wards of infirmaries have to be made available for more beds than those for which the fires alone will provide ventilation a similar plan should be adopted, that is to say, enclosing cases for steam or hot-water coils should be placed under windows on opposite sides, not necessarily under opposite windows, and openings for the admission of air made behind them; at the same time the extraction openings should be supplemented by suitable flues. It is difficult to assign very precise figures for the total areas of the extraction flues which would be necessary; from my own calculations I conclude that for a ward of about 1,000 square feet in area, the sectional area of the extraction flues should amount to 2½ square feet. In the wards where separate extraction flues already exist, they should be examined when in actual work to ascertain whether the total amount of air extracted by them amounts on the average to 20,000 cubic feet per hour; if not, they should be supplemented by special shafts introduced for the purpose, and where no extraction flues already exist, a sufficient number should be introduced. They should be carried up as high as the roof ridge, and surmounted by cowls. The inlet openings behind the coils should be sufficient to secure the action of the extraction flues in the proper direction when the fires are burning. If the total available area amounted to 2 square feet, it would probably be found sufficient.

If the wards with arrangements for the larger number of patients were used for the smaller number, the combination of fires and extraction flues would, if working successfully, give more ventilation than is actually required. There is no harm in that state of affairs, but the steam-pipes might be disused if it were wished, and in that way the fuel necessary to heat the pipes would be saved. The inlets behind them and the extraction flues should in that case be closed. The economy in view is perhaps too trifling for consideration when the risk of the action of frost upon the pipes is taken into account.

Infirmary Wards used for Segregating Children for Observation by the Medical Officer.

Wards with less than 500 cubic feet Space Allowance.—The third kind of ward referred to may be dealt with in a few words. This is the case in which the ward is occupied by children, so that they may be under observation by the medical officer. In this case still more air is required than in the second case, although the allowance of air per head per hour may be only 3,000 cubic feet, for if thirty children are accommodated instead of twenty patients, they require 90,000 cubic feet of air per hour instead of 80,000. The difference is not very large. The appliances indicated for the second case would be available for warming the air sufficiently, and as the avoiding of draughts is not so rigorously necessary, the air required might be obtained by opening the windows at the top above the coil cases and trusting to the effect of cross ventilation. To do so would practically stop the flow through the ducts behind the fires, and thus change the system upon which the ventilation depends. To realise effectively that different modes of using the same appliances are to be adopted on different occasions would demand unusual intelligence and skill on the part of those in charge, and on that account the use of the same ward for two such distinct purposes, with such widely different number of occupants, is hardly to be recommended. It would be better to adhere to one plan for ventilating, and not introduce more beds than can be properly ventilated on that plan.

The remarks and recommendation about adjoining water-closets, which were made in the case of dormitories, apply with equal or even greater force in the case of infirmary wards.

Reference to Certain Special Cases.

I have hitherto made only a passing reference to special kinds of wards, such as those used for infectious cases. If such cases have a full allowance of cubic space (say 2,000 cubic feet), and if the wards are kept sufficiently warm by means of open fires, there need be no difficulty about the ventilation. There would practically be two fires to about five beds, and consequently, on the same assumption as before of the power of a fire for extracting air, there would be 8,000 cubic feet of air per hour for each bed, which may be provisionally accepted as an adequate supply.

In dealing with the ventilation of the infirmaries I have restricted myself to considering what may be done to improve the ventilation of the wards as they now exist; if it were a question of providing new buildings, and if electrical power were available, I should not hesitate to recommend the provision of mechanical means for supplying air. It would, I think, be desirable in that case so to distribute the motive power that there should be separate motive power for the outlets and for the inlets. An infirmary ward seems to me to be especially one of those cases referred to in the introduction to this report, in which it is desirable to have in the ward neither a "plenum" nor a "vacuum," but a state of things in which the air pressure is the same as in the outside air, so that the windows can be opened if desired without causing draughts. The machinery of mechanical ventilation would lend itself without difficulty to such an arrangement, and a slight modification would make it possible to have an open fire in the ward without causing interference with the general arrangements of the ventilation; but in the schools under consideration it is not a question of new buildings, and electricity is not yet available. It is therefore unnecessary to go into the details of this suggestion.

Recommendations as to Infirmaries.

1. That in fixing the allowance of cubic space for infirmary wards regard be had to the means provided for ventilating and warming, and that in wards intended to be occupied day and night, the number of beds allowed be not more than at the rate of five for each open fire (or other motive power) capable of extracting 20,000 cubic feet of air per hour and satisfactorily arranged to supply warmed fresh air.

2. That for wards occupied by night and only partially by day, in which a larger number of patients is accommodated than that indicated by recommendation 1, the ventilation by open fires with fresh air supply be supplemented by providing cased hot water or steam coils under windows on opposite sides with openings to the outside air behind them at the rate of one pair of such coils for each 25 feet of length in the ward; that the casing be so arranged that all parts may be effectively and easily cleaned; that where separate extraction flues already exist they be overhauled and examined, and if found insufficient to give, on the average, in their ordinary working state, an aggregate flow of 1,300 cubic feet of air per hour per bed, they be supplemented by a sufficient number of additional flues; and that where no separate extraction flues exist, a sufficient number be provided to give, on the average, in ordinary working, a flow of 1,300 cubic feet per bed, in addition to 2,700 cubic feet per bed drawn by the open fires.

3. That provision be made as soon as practicable for attaching tell-tale indicators to the openings of the extraction flues to facilitate the adjustment of the inlet openings for the adequate ventilation of the wards.

4. That w.c.'s adjacent to the infirmary wards be provided each with a separate ventilating flue, in which a head for ventilation is maintained by a suitably placed gas jet or otherwise.

5. That provision be made for suspending in each ward a

card enumerating the appliances for ventilation and for warming with which the ward is supplied, and giving instructions as to the method of using them and as to the temperature which should be as far as possible maintained.

GLASGOW INSTITUTE OF ARCHITECTS.

THE annual general meeting of the Glasgow Institute of Architects was held last week in the rooms, 187 Pitt Street, Mr. David Barclay, vice-president, in the chair. Mr. C. J. MacLean submitted the annual report, which stated that the ordinary members now numbered seventy-two—the largest number in the history of the Institute. The Council for the ensuing year was elected as follows:—Messrs. Alex. Petrie, John Jas. Burnet, J. A. Morris, David Barclay, Alex. M'Gibbon, W. Forrest Salmon, Alex. N. Paterson, John Keppie, H. K. Bromhead, Jas. Lindsay, John L. Murray, Alex. Cullen, Miles S. Gibson, Jas. Miller and A. B. Morrison. Mr. N. Macwhannell was elected a representative to the joint house committee. A vote of thanks to the chairman terminated the proceedings.

TESSERÆ.

Nature and Art.

MAN is not a creator—he is a mere adapter. The most wonderful inventions of modern times are based upon discoveries made by diligent observers of the operations of nature. These specimens of art, which have been transmitted to us from a remote antiquity, excite pleasurable feelings proportioned to their approximation to the beautiful in nature. The Creator not only gave the earth a spheroid form, but He broke up its surface into mountain and ravine, hill and valley. He clothed it with an endless diversity of colour and peopled its regions with a countless variety of living forms. The continued succession of alternate scenes of grandeur and simplicity, of sublimity and beauty, of festivity and mourning, of sociality and solitude, all awaken and excite each its corresponding emotions; and to imitate these scenes and to excite similar emotions is the aim of true art and the achievement of high genius. If the greatest triumphs of art be felicitous imitations of nature, and if it be its chief aim to achieve such imitations—as who can doubt it is—why should we not have the walls and windows of our apartments decorated with these the most interesting of all the productions of genius? Why should we be deprived of the pleasure of contemplating the representation of objects endeared to us by the most delightful associations? Why believe ourselves capable of producing or conceiving more beautiful forms than those of nature—more harmonious arrangements of colour than we find in earth and sky? Let it be remembered that æsthetic proportion is the mere alphabet of colour, the mere anatomy of form, and that genius alone can arrange the former into eloquent sentences or invest the latter with animation. Geometric combinations and proportions merely mark the limits within which genius ought to confine its aspirations, while to the mediocre student they are grammatical rules, the study of which will enable him to write correctly. Seeing then that proportionate combinations of colour and form hold this relative position, on what ground can it be contended that the variety of figures and hues arising from such combinations should be used in decorations in preference to successful imitations of nature? If the human form was distorted or shapeless, or the colour of a rose offensive to the eye, then, indeed, might the imitation of such objects be objectionable and geometric proportion be considered the beginning, middle and end of all beauty and perfection. But as the most beautiful combinations of form and colour are to be found in nature, so will decorative art, under the guidance and control of first principles, become more and more perfect the more closely she studies the beauties and follows the designs of the divine original.

Primitive Electric Dischargers.

In an age when lightning made frequent devastation, Numa, instructed, we are told, by the nymph Egeria, attempted to propitiate it (fulmen piare), that is to say, setting aside the figurative style, to put in practice the means of rendering it less mischievous. He succeeded in intoxicating Faunus and Picus (whose names probably are used to designate the priests of the Etruscan divinities), from whom he learned the secret of making Jupiter, the Thunderer, descend upon earth, and he immediately put it into execution. From this time Jupiter Elicius was worshipped in Rome. Here the veil of mystery is too transparent not to be seen through. To render lightning less hurtful and to make it descend without danger from the bosom of the clouds, was both in effect and in end obtained by Franklin's beautiful discovery, as well as by the religious experiment repeated many times with success by Numa. Tullus Hostilius was less fortunate. "They relate," says Livy, "that this prince, when perusing the notes left by Numa, found among them some instructions on the secret sacrifices offered to Jupiter Elicius. He attempted to repeat them, but in his preparations for or celebrations of them he deviated from the sacred rite, and being thus exposed to the anger of Jupiter, aroused by a defective ceremony, he was struck by lightning and consumed in his own palace." An ancient annalist, quoted by Pliny, explains this event much more explicitly. "Guided by Numa's books, Tullus undertook to invoke the aid of Jupiter by the same ceremonies employed by his predecessor. But having performed imperfectly the prescribed ceremony (parum rite), he perished, struck by thunder." Instead of the word ceremony, if we substitute the word experiment, we shall perceive that the fate of Tullus was similar to that of Professor Reichman. In 1753 this learned man was killed by lightning while repeating, with too little caution, one of Franklin's experiments. Pliny, in the execution of Numa's scientific secrets, makes use of expressions which seem to indicate two distinct processes—the one obtained thunder (impetrare), the other forced it to lighten (cogere); the one was doubtless gentle, noiseless and exempt from any dangerous explosion, the other violent, burning and in the form of an electric discharge. It explains the story of Porsenna's destroying the terrible monster who desolated the territory of Volsinium—an explanation, however, which can scarcely be received, because, although it is not absolutely impossible, yet it is very difficult and dangerous to cause a strong electric detonation to take place at a very distant point; and there still remains the difficulty of drawing to this exact point the being whom it was intended to overthrow by the magical commotion. But in the coactive process mentioned by Pliny, and the well-known and well-attested possibility of obtaining, either from an isolated thunder-rod or an immense electrical battery, a discharge of such power that the luminous flash, the noise and the destructive influence of it completely resemble the effects of lightning, do we not perceive the secret of those imitators of thunder who so often became the victims of their own success, and who on that account were said to have fallen under the vengeance of the God whose arms they dared to usurp?

The Background in Painting.

From a story told of Rubens we have his authority for asserting that to the effect of the picture the background is of the greatest consequence. Rubens being desired to take under his instruction a young painter, the person who recommended him, in order to induce Rubens the more readily to take him, said that he was already somewhat advanced in the art, and that he would be of immediate assistance in his backgrounds. Rubens smiled at his simplicity and told him that if the youth was capable of painting his backgrounds he stood in no need of his instructions, that the regulation and management of them required the most comprehensive knowledge of the art. This painters know to be no exaggerated account of a background, being fully apprised how much the effect of the picture depends upon it. It must be in union with the figure, so as not to have the appearance of being inlaid, like Holbein's portraits, which are often on a bright green or blue ground. To prevent this effect the ground must partake of the colour of the figure, or, as expressed in a subsequent line, receive all the treasures of the palette. The background regulates likewise where and in what part the figure is to be relieved. When the form is beautiful it is to be seen distinctly; when, on the contrary, it is uncouth or too angular, it may be lost in the ground. Sometimes a light is introduced in order to join and extend the light on the figure, and the dark side of the figure is lost in a still darker background, for the fewer the outlines are which cut against the ground the richer will be the effect, as the contrary produces what is called the dry manner. One of the arts of supplying the defect of a scantiness of dress by means of the background may be observed in a whole-length portrait by Vandyke, in which the dress would have had an ungraceful effect. He has therefore by means of a light background opposed to the light of the figure; and by the help of a curtain that catches the light near the figure, made the effect of the whole together full and rich to the eye.

The Roman Sestertius.

The Romans generally reckoned sums of money in sestertii, although the coin used in making payments was commonly the denarius. The value of the denarius was at one period 8½*d.*, and therefore the sestertius was worth 2⅛*d.* After the time of Augustus the denarius was reduced to the eighth of an ounce, and was worth 7½*d.*, and therefore the sestertius was worth 1⅞*d.* Large sums they reckoned by sestertia, that is, sums of a thousand sestertii. It is very important to attend to the phrases used in such computations. The coin itself was called sestertius, or sestertius nummus, or simply nummus. The sum of a thousand sestertii was expressed by Mile sestertii, or M. sestertium, or M. nummi, or M. nummum or nummorum, or M. sestertii nummi, or M. sestertium nummum. The singular sestertium is never used for a thousand sestertii, but the plural

sestertia is used for all multiples of a thousand sestertii, up to a thousand; sometimes the word millia (thousands) is used instead of sestertia; sometimes neither word is expressed, and sometimes nummum is added. Thus 600,000 sestertii or 600 sestertia might be expressed by any of the following phrases:—Sescenta sestertia, sescenta millia, sescenta alone, or sescenta sestertia nummum. Sums of 1,000 sestertia and upwards were expressed by the numeral adverbs with the termination -ies, which implies that the number to which it is affixed is to be multiplied by 100. Thus decies, undecies, duodecies, vicies, tricies, tricies quinquies, stand respectively for 1,000, 1,100, 1,200, 2,000, 3,000, 3,500 sestertia. These forms are, however, sometimes varied. Thus Cicero uses quaterdecies for 1,400, and decies et octingenta millia for 1,800 sestertia. When two such adverbs come together, if the larger is first, they must be added together; but if the smaller is first, they must be multiplied. Thus we have in a passage of Suetonius, millies et quingenties for 150,000 sestertia, and immediately afterwards quaterdecies millies for 1,400,000 sestertia. (In the latter case care must be taken not to reckon the termination -ies twice over in multiplying; it is not 1,400 × 100,000, but 14 × 1,000 × 100.) The symbol HS or IIS is often used both for sestertii and for sestertia. It stands for libra libra semis (two pounds and a half). When applied to sestertii its meaning is clear enough, since the as was originally a pound (libra) of brass. When applied to sestertia it meant, according to Gronovius, two pounds and a half of silver, which he calculates to have been originally equal to 1,000 sestertii, and therefore to have represented that value ever after. It is often difficult to determine whether the symbol HS stands for sestertii or sestertia. When the numeral is written in cypher and has a line over it, it stands for the adverb in ies, and the HS means sestertia; thus, HS. $\overline{\text{CCCC}}$ is quadringenties, or 40,000 sestertia. Sometimes the numeral is found with the singular of sestertium, as sestertii decies, or sestertio decies. Gronovuis explains these forms and also the use of sestertium with the adverb in -ies (which he considers to be in this case an accusative singular), by understanding with them the word pondus, a pound (of silver), according to which sestertium in these forms means two pounds and a half of silver, or 1,000 sestertii. Hence, if these forms are used with a numeral in cypher they mean the number of sestertia represented by the adverb in -ies of that numeral. Thus sestertio X is decies or 1,000 sestertia. According to the value given above for the sestertius the sestertium was worth 8*l.* 17*s.* 1*d.*

The Greek Cella.

The cella was almost always built of large stones in the manner called isodomum, but sometimes with the stones of the ordinary size. The pavement was always raised higher than that of the portico, consequently there were always steps at the entrance, as is seen in the Parthenon, the two temples at Pæstum, that of Jupiter Panhellenius and several others. The exterior sides of the cella were very simple and had scarcely any ornament. At the four corners were antæ, which originally were evidently built for strength as counterforts, and which afterwards they ornamented with bases and capitals to give them a more agreeable form. The wall between the antæ was without ornament, they were satisfied by adding a base to the lower part, sometimes the same as the base of the antæ, sometimes differing from it in having fewer members. The upper part was ornamented with several members or with an entablature like that of the portico but less complete. The frieze was not so high, sometimes it had triglyphs, as in the great Temple at Pæstum and that of Apollo Epicurius at Phigaleia; sometimes it was without, as in the Temple of Jupiter Panhellenius in the isle of Egina. In some temples the cella was ornamented with bassi rilievi, with which they also ornamented the frieze, as in the Temple of Minerva on the Sunium promontory, where is represented the combat of the Centaurs and Lapithæ; upon that of the Parthenon, sacrifices and solemn processions of tho Athenian people called Panathenæa, and at the Temple of Theseus at Athens the combat of the Centaurs, and that of Apollo Epicurius with similar subjects. Above the floors, both in the pronaos and porticus, of the cella of the Temple of Jupiter Olympius at Olympia, are represented the Labours of Hercules; on the front entrance are five: the taking of the Erymanthean boar, the death of Diomede, king of Thrace, the combat with Geryon, Hercules sustaining the heavens in the room of Atlas, and the cleansing the Augean stables. And on the rear entrance were represented six others, namely, the conquest of Hippolyte, the taking of the stag with brazen horns, the conquest of the Cretan bull, the destruction of Stymphalidæ, the conquest of the Lernæan hydra, and of the Nemæan lion. Quatremère de Quincy imagined that these representations formed a continued series of bassi rilievi, but Professor Cockerell was of opinion that they were separate in the metopes, as in the temples of Theseus and of Apollo Epicurius. In the interior of the cella was placed the statue of the god to whom the temple was dedicated; it was always raised upon a base opposite the entrance and placed against the rear wall. In the hypæthros it was placed near to the door of the rear front, at the place where the galleries and porticoes of the interior joined and formed a canopy over the statue, but as this was hardly sufficient to protect it from the injuries of time, they placed a veil or curtain before it when they were not sacrificing. There was a magnificent curtain in the Temple of Jupiter Olympius; it was a present from Antiochus made of wool, curiously wove in the manner of the Assyrians and coloured with Phœnician purple; one of the same kind was in the temples of Diana at Ephesus and at Athens. When they wished to expose the statue they lowered the curtain, as in the Temple of Jupiter Olympius, or raised it as in that of Diana. This curtain was not used, as Stuart thought, for a covering to the middle of the cella of the hypæthros, and cannot be compared with the velaria of the Roman theatres and amphitheatres.

Correspondence

Post Office, Amsterdam.

Sir,—I beg to inform you that you made a mistake in the last number of your esteemed paper, as the name of the architect of the new post office is not J. L. Cuypers, as you mention under the illustration of that building, but C. H. Peters. Numbers of your readers in Holland are greatly astonished that it was unknown to you that Mr. Peters is the architect of that fine building, and therefore you will greatly oblige me if you will correct the mistake in a striking manner in the next number of *The Architect*.—I remain, dear sir, yours truly,

F. W. Braat.

Delft: October 19, 1898.

Workmen's Compensation Act.

New Buildings (*O. H. H.*).—The builder will be liable to pay compensation under the Act. The clause suggested by you would do no harm, and might give you additional protection.

Height (*Hotel*).—There is no prescribed method of measuring the height, but the arbitrator may have some guidance from the London Building Act, 1894, which enacts that "height" means the measurement taken from the level of the footway in front of the centre of the face of the building, or (where there is no such footway) from the level of the ground before excavation to the level of the top of the parapet, or where there is no parapet, to the level of the top of the external wall, or (in the case of gabled buildings) to the base of the gable.

M. R.-J.

GENERAL.

M. Constant Moyaux, architect, was on Saturday elected to the Académie des Beaux-Arts, in succession to the late M. Charles Garnier. He has been for a long period architect to the Institut.

A New Israelite Hospital is to be erected at Breslau by the Baroness Hirsch.

The Marquis of Exeter will preside at a public meeting to be held at Peterborough on November 2 in aid of the Cathedral Restoration Fund.

M. Edouard Corroyer on Tuesday read a paper at the general meeting of the French Institut on the "Origins of French Mediæval Architecture."

The Doré Gallery, Bond Street, has been reopened, and contains several of the painter's familiar works. It will be interesting to know whether a new generation will be as fascinated with them as those who were first impressed by their vigour.

The Superannuation Conference convened by the Municipal Officers' Association will be held on Monday next at Sion College, Victoria Embankment, at 8 P.M. Mr. C. Wm. Tagg will preside, and will be supported by Sir John Blundell Maple, M.P., Major P. H. Dalbiac, M.P., Mr. John Lowles, M.P., and other influential gentlemen.

The First Ordinary Meeting of the Institution of Civil Engineers will take place on Tuesday next, November 1, at 8 P.M., when an address will be given by Mr. W. H. Preece, C.B., F.R.S., the president, and there will be a presentation of medals and prizes awarded by the Council. There will also be a reception by the President in the library after the meeting. At the second meeting, on Tuesday, November 8, the following paper will be read and discussed:—"The Extraction of Nickel," by Professor W. C. Roberts-Austen, C.B., F.R.S., Assoc.Inst.C.E.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

**** As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than 2 P.M. on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

WITH the new volume commencing with the November part, the *Magazine of Art* will celebrate its coming of age. To mark the event new type and new paper are being employed, whilst colour will be extensively used by the newest and most artistic processes. The keynote that will distinguish the magazine henceforth will be the brightness and interest of all its articles, whilst it will continue to present the latest developments of art. A leading feature of the November part will be an article, illustrated throughout in colours, by Mr. Wilhelm, on "The Adaptation of Flowers to Artistic Fancy Dress."

Reading Cases for the Architect.—Price Two Shillings. Office: 175 Strand, London, W.C.

ELECTRIC NOTES.

At a special meeting of the Cheltenham Town Council the deputy-mayor (Alderman Norman) moved that application be made to the Board of Trade for powers to extend the electric-lighting area so as to include those portions of Charlton and Leckhampton which have been added to the borough since the electric-lighting order was obtained. Mr. Baker seconded and the motion was agreed to.

To meet demands for the electric light the St. Pancras Vestry have decided to extend their mains to Guilford Street, Heathcote Street and John Street, Bloomsbury.

Through some failure of Wolverhampton electric-lighting plant last Saturday, the greater part of the town was for nearly three hours plunged into semi-darkness. A couple of evenings before Brighton was in similar case; but here, although the inconvenience was greater while it lasted, owing to the more general use of the current for lighting purposes, the difficulty was only of some twenty minutes duration.

At the ward meeting in Coatdyke School, Coatbridge, last week, Bailie Lavell, convener of the lighting committee, stated that he was prepared to propose to the Town Council the advisability of purchasing the works of the Scottish House-to-House Electricity Company, Limited, in the burgh, which have hitherto proved unsuccessful in the hands of the company, but which, he believed, would become successful in the hands of the Corporation. Bailie Davidson, while ready to give the matter serious consideration, was of opinion that unless they got the works at a very low price it was not likely to pay the Corporation either for a considerable time.

A special meeting of the Motherwell Town Council had before them the question of laying down an installation of electric light within the burgh. Mr. Jack, convener of the committee who have had the matter under consideration, submitted a report by Professor Alexander B. W. Kennedy, who has been retained by the burgh. The total capital expenditure is calculated to be over 23,000*l.*, the scheme providing for private lighting, thirty arc lamps and 400 32 candle-power incandescent lamps for street purposes, and for power for mechanical purposes. After some discussion the report was adopted. The works will be proceeded with at once.

A remarkable case of death from electric shock was investigated last week at the Marylebone Coroner's Court, the victim being Henry Stagg, aged thirty-two years, an electric wireman in the employ of the Metropolitan Electric Supply Company, who was killed at Rathbone Place, Oxford Street, where he was engaged covering wires leading to a switch-board. The deceased was, according to evidence, noticed to be in a semi-reclining position against the board, his feet being in contact with the terminals on the floor underneath the board, which was marked "dangerous." There were rubber mats on the floor, and a fellow workman who was with the deceased deposed that he had never known rubber to be a conductor of electricity. There were 1,000 volts on at the time. The company's engineer gave it as his opinion that the deceased had fallen across the terminals of one of the machines. He had never known the force of 1,000 volts to kill a man before. The medical testimony was to the effect that death was due to electric shock, and a verdict of "Accidental death" was returned.

There was a large gathering of members of the Hull Corporation and representatives of other public bodies on the 24th inst. at the opening of the new electric-lighting extension works in Sculcoates Lane. The extension has involved an expenditure of something like 40,000*l.* The building consists of two lofty bays, with louvre lights for engine-room and boiler-house. In the engine-room there are four steam dynamos of 760 horse-power. The electric current will be generated at from 2,000 to 2,250 volts, and transmitted to sub-stations at Albion Street and Argyle Street, where it will be transformed to a low pressure of 220 volts. Amongst the adjuncts to the station is a large tank, having a capacity of 30,000 gallons, the water for which is to be drawn from Barmston drain. From the station there runs 9 miles of electric mains for the supply of the Hessle and Anlaby roads districts up to the Boulevards; and mains are about to be laid by which East Hull residents will have the opportunity of using the illuminant.

TRADE NOTES.

We learn that Milners' Safe Company have again had to extend their works owing to the great pressure of work. They have built an enormous shop and equipped it with the most up-to-date machinery, especially for the construction of bankers' strong rooms, safe deposits and the highest class of security work. Milners' now control one of the finest engineering works in the country, and their numerous sales depôts find plenty of business to keep the works constantly going at high pressure.

MESSRS. SHANKS & Co., sanitary engineers, Barrhead, have secured the contract for a large underground convenience in the Market Place, South Shields. The work will be of the best quality throughout.

MESSRS. HORNE, SON & EVERSFIELD inform us that in consequence of their offices at No. 17 Great George Street being required by the Government under the Public Offices (Westminster) Act, 1896, they have temporarily removed to No. 19 Great George Street.

THE new hospital, Bucknall, Staffs, is being warmed and ventilated by means of Shorland's patent double-fronted Manchester stoves with descending smoke-flues and Shorland's patent Manchester grates.

BUILDING AND BUILDERS.

A PRIMITIVE Methodist church is being built at Dirtcar, in the Wakefield second circuit, at a cost of 500*l.*

THE memorial-stones of a new Calvinistic Methodist chapel at Carmel, near Holywell, were laid on the 23rd inst.

THE foundation-stone was laid on Monday last of a church which the vicar (Rev. H. Proctor) is about to build in the populous parish of St. Luke's, Gloucester.

THE plans for the church to be erected in Lockwood Street, Driffield, at a cost of over 3,000*l.*, have been formally adopted, and the work is to be pushed on apace.

THE ceremony of laying the foundation-stone of a new drill hall for the 1st Dorset Artillery Volunteers, estimated to cost 3,000*l.*, took place on Saturday afternoon at Bournemouth.

THE foundation-stone of a new Congregational church which is to be erected, at a cost of 8,500*l.*, at the corner of Tetherdown and Queen's Avenue, Muswell Hill, was laid on Saturday afternoon.

WHILE repairing a roof at Earlestown, John O'Neill, slater, about sixty years old, fell from a ladder just as he was climbing on to the roof. He had only started to work about half-past ten, the accident occurring a few minutes afterwards.

THE contract for rebuilding the Seaborne Coal Wharf at Bermondsey Wall, from the designs of Mr. Henry Adams, M.Inst.C.E., has been let to Messrs. Holliday & Greenwood, of Loughborough Park Works, Brixton.

A MASON named Thomas Mallinson (35), of Berry Brow, Huddersfield, sustained serious injuries on Tuesday by falling from a mill which is in course of erection at Longwood. He was admitted into the infirmary.

LADY OSBORNE MORGAN on Tuesday last laid one of the foundation-stones of a new schoolroom in connection with the Bradley Road Baptist Mission chapel, Wrexham. The schoolroom will cost 800*l.*

WHILE working a day or two since on a roof in the Gray's Inn Road a plumber named Walters, of Kentish Town, slipped and fell through a glass skylight to the ground, sustaining severe internal injuries.

THE corner-stone has been laid of the new church of St. Ambrose, situated on the Bournemouth West Cliff. The portion of the new edifice which it is now proposed to erect will cost between 8,000*l.* and 9,000*l.*, and will seat about 700 people.

THE sewerage committee of Aberdeen Town Council have resolved to apply to Parliament for the necessary powers to carry out the following works:—High level sewer, 11,000*l.*; Girdleness outfall, 47,750*l.*; low level sewer, 7,670*l.*; Ferry Hill storm-water culvert, 8,200*l.*; Tile Burn storm-water culvert, 5,500*l.*; other storm-water overflows, 1,025*l.*; connecting sewers at Hutcheon Street, Millburn Street and Torry, 8,100*l.*; Don Valley outfall, 10,500*l.*; total, 99,765*l.* An amendment by Bailie Taylor anent a scheme costing 187,105*l.* was defeated by six votes to two.

THE foundation-stone of the Belfast new City Hall was laid on the 18th inst. in the presence of the Viceroy, when a new departure was made, as in the cavity beneath the stone, in addition to the usual records, newspapers, coins, &c., there was deposited a wax phonograph-cylinder, of the ordinary type, used for the Edison-Bell phonograph. On this cylinder were engraved a few appropriate sentences spoken by the lord mayor, Alderman W. J. Pirie, and the Town Clerk of Belfast.

THE foundation-stone of the new Whitefield's Tabernacle, in the Tottenham Court Road, was laid on Friday last by Dr. Parker. The architectural designs for the new church have been prepared by Mr. Rowland Plumbe, and show a spacious and handsome building in red brick and white stone dressings. It will seat 1,150 persons, while the hall beneath will accommodate 800. The new church will be the third on this site, the second having been built in 1831, and it was then the largest Nonconformist church in the kingdom.

The YŌST TYPEWRITER CO., 50 Holborn Viaduct, E.C.

A PORTION of the roof of one of the departments of the Malleable Steel and Iron Works at Stockton fell in while upwards of thirty men were at work. With the exception of two men—Thomas Littlefair and Edward Cain—all escaped unhurt. Littlefair was badly cut upon the shoulder, while Cain was knocked on to a hot steel plate, where he was held fast for some time.

AT the statutory meeting of the British Clayworkers' Mutual Insurance Corporation, held at the offices, 43 Essex Street, Strand, on the 20th inst., Mr. John C. Hill, the chairman, stated that the result of their mutual insurance scheme, which was started in June last as a protest against the excessive charges of the tariff insurance offices, had proved an amazing success. They had a capital of something over 16,000*l.*, and up to that time had paid in claims only 100*l.* The corporation was formed for the insurance of brick, tile and pottery makers in this country, under the management of Mr. H. Greville Montgomery, 43 Essex Street, Strand.

IN Dumbarton Sheriff Court on Friday last, Sheriff Gebbie and a jury held an inquiry into the death of a Dumbarton labourer named Joseph Connolly, who was killed in the Leven Shipyard on October 10. From the evidence it appeared that the deceased, along with some fellow-workmen, were shifting iron in the shipyard on the evening in question. Deceased's work was near a pole from which was suspended an electric lamp, and attached to the pole was a wire stay. When work was proceeding Connolly was heard to scream, and on the workmen proceeding to his assistance he was found with his hands clenched to the wire stay. They tried to detach him, but sustained electric shocks, and so they had to remove the deceased from the wire with a piece of wood. He was then unconscious, and shortly afterwards died. The jury unanimously found that Connolly was accidentally killed in consequence of his seizing hold of a wire charged with electricity while employed and at work in the Leven Shipyard.

AT the parish offices, Putney, on the 21st inst., Mr. A. Braxton Hicks resumed his inquiry with reference to the death of John Bernard Winch, aged fourteen, a bricklayer's apprentice, lately residing with his father at 43 Ram Square, Wandsworth, who was killed on the 12th inst. through falling from a scaffold 52 feet high. Mr. Jasper Redgrave, H.M. inspector of factories, represented the Home Office. The deceased's father, himself a workman on the same building, recalled, said the scaffold was unprotected. It was usual for such lofty scaffolding to be protected. The deceased was pointing the brickwork. John Coker, a general labourer, of 23 Lifford Street, Putney, said he and two other men erected the scaffolding. He did not know who was responsible, but supposed Peach, the general foreman, was. It was not intended to be used for pointing brickwork. He told the deceased's father so. Winch emphatically denied this. The coroner and some of the jury at this juncture having inspected the scaffold, Coker admitted that he removed a plank to enable the deceased lad to work on the scaffold. Henry Roffey, of Guildford Works, Putney, the contractor for the work, stated that he was on the scaffold on the morning of the accident, but he did not notice that the north side was unprotected. He did not walk round that side. James Peach, the foreman, admitted that if he had seen that the scaffold was unprotected he would have had a guard put on it. Witness did not consider himself responsible after he had given orders for the erection. The jury, after some deliberation in private, returned a verdict of accidental death, and added a rider to the effect that Mr. Roffey was greatly to blame for not employing practical scaffolders, and for not himself seeing that the scaffolding was safe.

VARIETIES.

NEW Baptist Sunday schools have been formally opened at Tenterden Street, Bury. A new chapel is nearly completed.

THE Archbishop of Canterbury took part on the 20th inst. in the opening and consecration of the new parish church at Swansea, which has been built at a cost of 26,000*l.*

THE roof of a church in the Faubourg de Santa Lucia, Verona, which was undergoing repairs, fell on Sunday morning. The accident was attended by serious consequences, and five lives were lost.

THE Academy erected at Leith Links by the School Board was formally opened by the Right Hon. Lord Reay, in presence of a large company of ladies and gentlemen and a representative gathering of pupils, on the 22nd inst.

THE contract for the construction of forty-eight huge lifts, capable of carrying 120 passengers, for the Central London Electric Railway, has been given to an American company.

ON the invitation of the Lord Provost, Magistrates and Council of Edinburgh, a large company of citizens assembled at the Calton Hill on Monday night on the occasion of the opening of the City Observatory.

CATHEDRAL SERIES—ST. ALBANS: LOOKING ACROSS NAVE.

EASTCOTE, PINNER.

ST. GEORGE'S CHURCH, STOCKPORT.

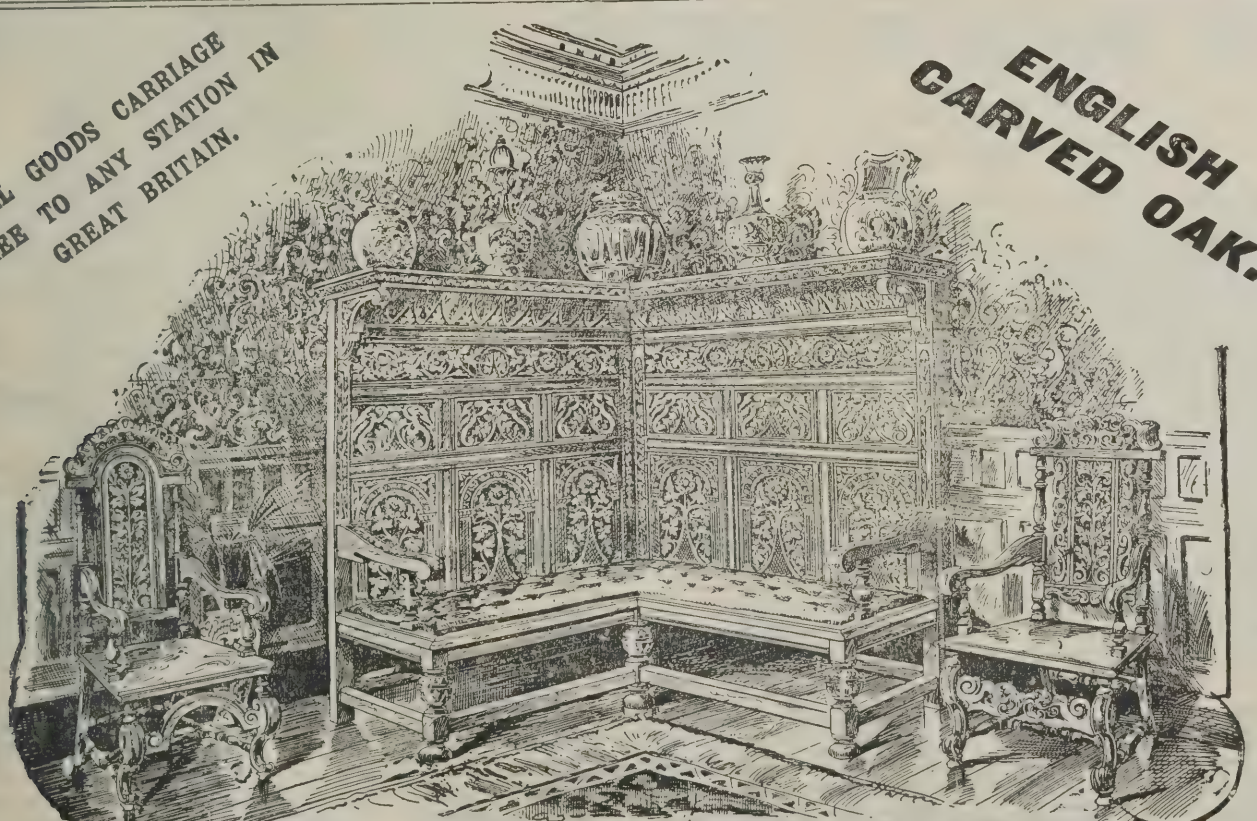
THE new police-station for Poplar, which has for some time past been in course of erection in the East India Dock Road, is now complete and ready for occupation. The building is a large structure of red brick with stone dressings, and is designed very much on the lines of New Scotland Yard, while the internal arrangements and sanitation of the interior are as perfect as possible.

THE Auld Brig of Ayr has been again closed for traffic. It was observed that a large piece of the up-river buttress of one of the middle piers was hanging out, probably caused by the heavy floodings of last week. Only pedestrian traffic has been allowed across the structure for many years, and it was deemed advisable to exclude the public from the thoroughfare till the extent of the damage had been ascertained.

THE parish church at Kilymaenllwyd, in Carmarthenshire West, has been reopened after restoration. It has undergone a thorough renovation. A new porch has been erected at the west end, the only previous entrance being a door in the chancel, so that the worshippers had to pass through the altar rails before reaching their seats. The total cost amounted to about 530*l.*

THE twentieth annual trade gathering in connection with brewers, maltsters, distillers, mineral-water manufacturers, &c., will open at the Royal Agricultural Hall, Islington, N., on Saturday, the 29th inst. No efforts have been spared to make the show an interesting one, and many more firms are exhibiting on this occasion, the whole of the ground floor and galleries being fully let. The list of awards in the malting barley competition has been considerably added to and the number of classes extended, and cash prizes and diplomas are also being offered for English hops. These contests have done much to further the joint interests of farmers and brewers, and the entries are again reported to be most satisfactory. The railway companies are affording the usual facilities in the way of special excursion trains from all parts of the country.

A SERIOUS accident occurred on Monday evening at the Princess of Wales's Theatre, now in course of erection in Kennington Park Road, by Messrs. Wallis & Co, for Mr. Robert Arthur. It appears that about 6 o'clock on that evening, after most of the workmen had left, some men were left behind engaged in the construction of the stage. Two large joists, 12 inches by 6 inches, had been placed in position but not fixed. Some of the men were bringing in timber to be used in the work, and when they were crossing one of the joists it suddenly gave way, and both men and timber were precipitated to the ground below. Others who were doing carpentering work, hearing a crash, saved themselves by creeping under the other joist, but three men appear to have suffered injury. One, named McFee, received a serious blow on the side of the head, and was knocked senseless. One of the others was hurt on the back, and a third received injuries to his legs.



AN arbitration case, involving the rateable value of the Oxford Music Hall in face of the forthcoming widening of Tottenham Court Road under the L.C.C. Improvements Act, came on for hearing on Wednesday at the Surveyors' Institution, with Mr. Green sitting as arbitrator. Mr. Young, surveyor to the London County Council, estimated that the highest value of cubic area in any part of the property was not more than 3*s.* per foot and not less than 2*s.* Other evidence to the same effect was given, and the arbitrator reserved his judgment.

OF the ancient castle at Sandgate, which was erected in the reign of Henry VIII., and was visited by Queen Elizabeth in 1573, very little now remains, and that little is threatened with destruction, the heavy gales of late having completely undermined the foundations. A survey made by the Government officials yesterday morning showed that the damage is very extensive, and unless prompt measures are taken the ancient buildings will collapse. The sea wall at Sandgate has also been badly damaged.

THE prestige of the Alhambra Theatre, which at one time seemed to be seriously on the decline, is now again, thanks to the indefatigable efforts of Mr. C. Dundas Slater, firmly re-established, and a crowded audience again nightly applauds the excellent turns of a lengthy programme, among the prominent features of which may be specially mentioned the doggy sketch called "Dad's Treasure," in which the wonderfully-trained canine artistes go through their performance with an accuracy and a *verve* which is hardly surpassed by their human associates. Then the charming "Charmion" still delights with her graceful, if somewhat *risque*, disrobing scene and her finished performance on the trapeze. The Rappo sisters,

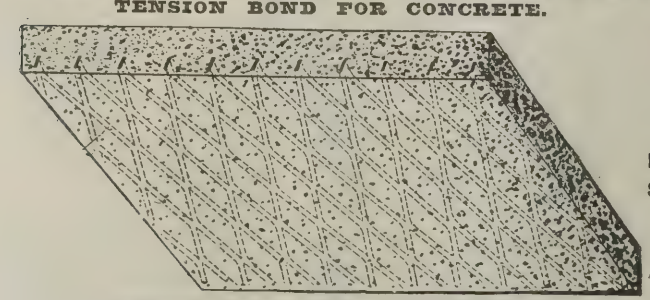
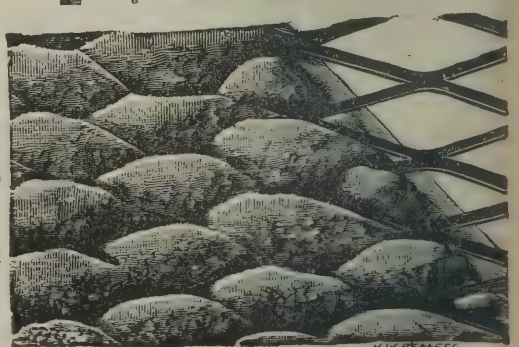
Russian dancers, give an exhilarating series of their national dances with grace and *entrain*, and the same may be said of the Spanish dancers, the Hermano Morenos. Among the other artistes are Hurgini (juggler), the Bonhairs (acrobats), Miss Lena Verdi, ballad singer, and M. Henri Leoni, French baritone, "Jack Ashore," which is described as "an unpretentious sketchy divertissement," still goes as brightly as ever. The latest arrivals, Les Boxeurs François, display a marvellous amount of agility in their exposition of the French idea of the "noble art," and the *coup de savate* gives rise to a good deal of lively argument.

The Meffan Institute, the gift of the late Miss Meffan sister of a former Provost of Forfar, was opened in Forfar last week. In it is provided gratis accommodation for the free library (20,000 volumes), library committee-rooms, a hall capable of holding 300 people, a reading-room to accommodate sixty readers, a reference-room to seat twenty-four, and a museum, the nucleus of which already exists and is held by the Town Council. The building is also endowed to the extent of 2,000*l.*, the interest of which will pay for a caretaker and repairs, and any surplus is to be devoted to the purchase of newspapers and periodicals. The institute will doubtless be much appreciated in Forfar, where such an institution has been a long-felt want.

On Tuesday morning a joint deputation from the Bradford City Council, the Bradford Chamber of Commerce and the inhabitants of West Bowling, a suburb of Bradford, waited upon the board of directors of the Lancashire and Yorkshire Railway at Manchester. Mr. G. J. Armytage (chairman) presided over a full attendance of directors. The deputation comprised Mr. Speight (mayor), Mr. H. Sutcliffe (president of the Chamber of Commerce), Ald. Holdsworth, Mr. Amos Crabtree, Mr. Thomas Suddards and Councillor Dixon. Their mission was to ask that a passenger station might be erected on the company's line at West Bowling, about a mile and a quarter from the station in Bradford. Statistics were given to the board showing that a considerable increase of population had taken place in the neighbourhood within recent years, and that just recently 450 new houses had been built there.





At a special meeting of the Sheffield City Council on Wednesday, the Lord Mayor moved a resolution that the whole of the markets of the city be purchased from the present owner, the Duke of Norfolk. The total area of land included in the sale is 43,392 square yards. The gross income from the markets and other premises during last year was 18,866*l.*, and the expenditure for the last ten years averaged 6,380*l.* per annum. The price to be paid is 530,000*l.* The resolution to purchase the markets was carried, and the Parliamentary committee was instructed to prepare a bill in Parliament for next session.

At a meeting of the Hawick Archæological Society on the 25th inst. a paper was read by the president (Rev. W. A. P. Johnman) on "Archæology in Orkney and Shetland," with special reference to the chambered mound of the Maeshowe, near Kirkwall. He said it strongly resembled Hawick moat in size, shape and general appearance. The chief point of difference was that it had been explored, and Hawick moat had not. The Maeshowe was chambered, and its wonderful architecture was an open book to multitudes who annually visited it. Inside were found mysterious Scandinavian writings, said to date from the twelfth century. In Orkney there were many such chambered cairns. Near by were the colossal standing-stones of Brogarn, while those of Stenners were only a mile and a half distant. Some archæologists held that these remains were the sepulchres of Druidical kings, while others were of opinion that they were places of worship. Mr. Johnman was thanked for his address.

The town clerk of Stirling has received a communication from the directors of the North British Railway Company intimating their agreement to the proposals of the Caledonian Company for the erection of a new station at Stirling, and the work will now be proceeded with. There will be five platforms, ranging from 50 to 100 yards in length, the ground to the east, presently occupied by shunting sidings, being utilised for the new works. The whole of the present buildings on both sides of the main line are to be taken down and a handsome new structure erected with all modern conveniences. No arrangement is made for a new entrance from the Shore Road, but it is expected that this concession will be made, which will prove a great convenience to the residents in that part of the town. Every effort will be made to complete the work before the Highland Society's Show in 1900. General satisfaction is expressed in the town that this long-delayed improvement will at length be carried out.

On the 24th inst. Sir W. H. Broadbent, of London, opened the new Municipal Sanatorium which has been erected at Mill Hill, Dalton, one of the outlying portions of the borough of Huddersfield. The site of the hospital is about two miles from the centre of the town, and the buildings are erected on the pavilion principle. From the administration block there is a

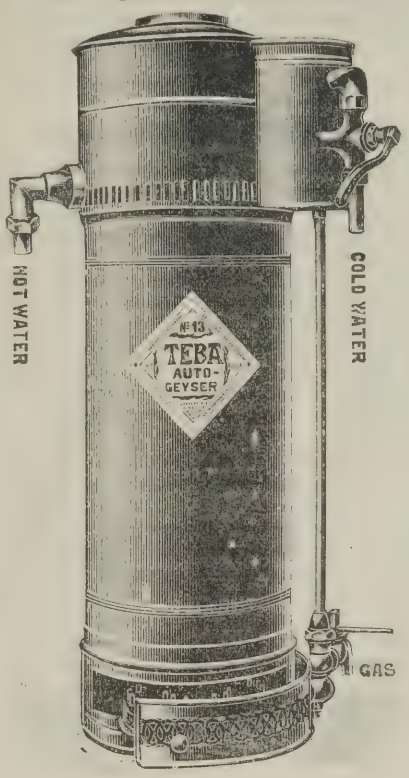
covered way leading to the three ward pavilions, each of which will provide accommodation for thirty patients. There is also an isolation block in course of erection. Further, there are the receiving and discharge blocks, laundry, disinfector blocks and other buildings. There are 90 beds, which, with 70 at the Birkby establishment, 20 in the smallpox department at Mill Hill, and 10 in the additional isolation blocks, gives a total of accommodation of 190 beds.

NEW CATALOGUE.

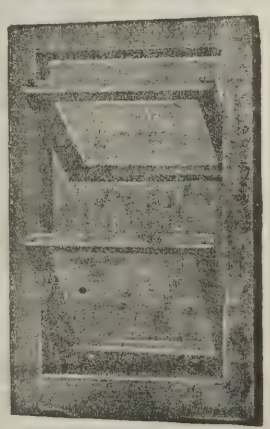


We have Messrs. R. G. Ward & Co.'s (of 5 Laurence Pountney Hill) new catalogue of blue lias hydraulic lime, Portland cement, blue Staffordshire bricks, pressed and wire-cut gault bricks, red and white facing bricks, red and blue roofing and ridge tiles, red, blue and buff paving tiles, blue garden edging tiles, chimney-pots, pans and traps, sanitary pipes, sinks, &c. As these are all depicted in well-sketched illustrations carefully printed, selection is greatly facilitated, and the book will be found of considerable value for reference, especially as in many cases prices are given.

THE "TEBA" AUTO-GEYSER.

The Maughan geyser system of heating bath water is well known, and has for a score of years been a source of comfort in many households ; in fact, it is said that there are at the present moment no less than 12,000 in use ; but, good as it has proved, it has at last been improved upon, and the "Teba" auto-geyser will no doubt speedily oust it from its present eminence. In the old system, the necessity of manipulating the apparatus when hot water is required has limited their use to situations where this is convenient.

The "Teba" auto-geyser overcomes this drawback, and combines the advantage of the best form of geyser with the convenience of the "circulation" system, is automatic, and the mere opening of a tap in any part of the house below the level of the geyser sets it in action and provides an immediate and unlimited supply of hot water so long as the tap remains open. When the tap is closed the geyser is automatically put out of action, the cold water supply shut off and the gas reduced to a small pilot jet.



The "Teba" auto-geyser is fitted in any convenient place in the upper part of the house, and requires gas and cold water supplies only. No return pipe or hot-water cistern is required, the water being heated as it flows through the geyser, and there being no circulation of water the deposit of lime or "fur" from hard water is reduced to a minimum. It can be fixed by any plumber at a small expense, and easily removed if desired. If

hot-water pipes are already arranged, the auto-geyser can usually be connected to them and thus act as a substitute for, or auxiliary to, the "circulation" system. The automatic arrangements are extremely simple—no weights, springs, valves or diaphragms being employed, and are not likely to get out of order.

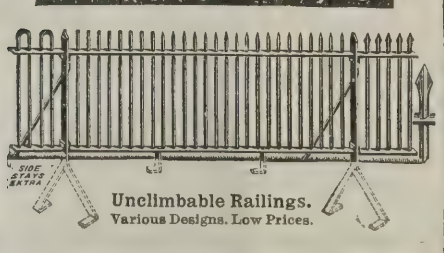
Like the older form, it is being brought out by Maughan's Patent Geyser Co., Limited, of Holywell Row, Finsbury, and 51 Queen Victoria Street.

THE SANITARY INSTITUTE.



At the Sanitary Institute Sir Douglas Galton delivered the introductory lecture to the twenty-sixth course of lectures and practical demonstrations in sanitary science for sanitary officers and students. The lecturer explained that the passing of the Public Health Act, 1875, was the first effort which the Legislature made to deal with the health of the country as a whole, and that Act had been supplemented by numerous other Acts as well as by by-laws. One of the first problems which occupied the attention of the founders of the Institute was that of improving the knowledge, and through that the status of the sanitary inspectors. In the Public Health Act of London, 1891, Parliament required that sanitary inspectors should possess a certificate of competency for the performance of their duties from some examining body approved by the Local Government Board. That Board had determined that in future there should be a single examining body, and that that body should be composed of delegates representing the Sanitary Institute, the medical officers of health, the municipal and county engineers, the Royal Institute of Public Health, the National Health Society and the Carpenters' and Plumbers' Companies. The Institute, however, would continue to hold examinations generally for persons who desired certificates of proficiency in sanitary knowledge without reference to any official posts in London. The lecturer impressed upon sanitary inspectors the necessity of using tact in the performance of their duties, and in conclusion said he would like to see sanitation made a branch of elementary education.

SANDEMAN PUBLIC LIBRARY, PERTH.

The new Sandeman Public Library, Perth, was opened on Saturday by the Earl of Rosebery. The library is the gift of the late Professor Sandeman, Owens College, Manchester, who left the residue of his estate to provide a library for the citizens of Perth. The net amount of the bequest is 33,000*l.*, and of this about 14,000*l.* has been spent on the building and furnishing, and 2,200*l.* on books, leaving an endowment of about 17,000*l.*, which is at present burdened by the payment of annuities to the extent of 400*l.* The building, which was erected from the designs of Messrs. Campbell, Douglas & Morrison, Glasgow, occupies a central position in the city, and has all the advantages of a corner site. It is Italian Renaissance in style, and built of red freestone, and having four polished granite pillars in the centre of the front elevation in Kinnoull Street, presents a very handsome appearance. The site is an oblong one, with a north and an east frontage, extending from Mid Street on the north along Kinnoull Street—a new thoroughfare—half-way to the High Street. The main door is in Kinnoull Street about the centre of the building, and on its entablature is a carved shield with the city arms in relief, and immediately over this in front of the fanlight is a wrought-iron grille with the Sandeman arms in bronze. The door opens into a spacious vestibule, the walls of which are treated with a facing of rich marble with good effect, the dado being of rouge griotte, and the upper walls pavonezza, a cream-veined marble, while the floor and steps are of white Sicilian marble. On one of the walls of the vestibule is a memorial brass, commemorating the late Mr. Sandeman's gifts, placed in a beautifully carved setting of alabaster, with four heraldic shields in the corners, including the Sandeman arms and the city arms. Passing from the vestibule, the entrance hall is reached, from which access is gained to the lending department on the left at the south end of the building, the librarian's room opposite the entrance, the main staircase and the general reading and juvenile rooms to the right. The ground floor, on which the foregoing apartments are situated, is 4 feet above the street level, and the ceiling is 17 feet 6 inches in height. The entrance hall and the space for the public in the lending room are floored with cream mosaic, with borders in rich colours. The other floors are laid with red pine in narrow boards. The lending library is a handsome apartment, 53 feet by 35 feet, giving accommodation for about 25,000 volumes. The space for the public, with the service counters and indicators, is in the centre of the room, on the north side; and the bookshelves, of Kauri pine, are arranged round the walls, with standard bookcases—Messrs. Lucy & Co.'s, of Oxford—placed with their ends to the windows, which give light on south, east and west. The ceiling is richly moulded in

plaster. This section of the library—usually the most popular one—is most easily accessible, whilst the counters and indicators are so arranged as to enable Mr. Minto, the librarian, and his assistants to serve the public with the least possible delay. The general reading and juvenile rooms are the next section of importance on the ground floor. The former, which is 57 feet long by 35 feet wide, has a light on three sides. The juvenile room, 21 feet by 20 feet, is between the reading-room and the entrance-hall, and is accessible from both. Both rooms have a high dado of tiles of a rich greenish colour with a red marble base. In each room the reading tables and newspaper stands are placed at right angles to the walls and opposite the windows, and together give accommodation for 110 readers. Ascending a spacious and handsome staircase the first floor is reached, on which is placed the reference department, book store, ladies' room, committee-room, &c., and there is a private door to the librarian's house on the same level. The reference-room, 37 feet by 35 feet, to the north of the building is lighted from the roof on all sides. The ceiling is coved and panelled in plaster-work, and the average height is about 21 feet. The lower walls are panelled in yellow pine, and the upper walls are divided by panelled pilasters with enriched capitals, carrying the main beams of the roof. Adjoining the reference-room on the west is the ladies' room, 30 feet by 18 feet, with a private lavatory, &c. It is finished similar to the reference library with a richly-moulded ceiling. These two rooms give accommodation for eighty-eight readers. The tables are so arranged as to have the maximum of light, and to face the attendant's desk at the doorway, with the book store, 30 feet by 20 feet, immediately behind. The book store also is roof-lighted, and with wall shelving and standard bookcases gives accommodation at present for about ten thousand volumes. To the right of the staircase is the committee-room, which is 22 feet by 17 feet, richly decorated and furnished. A private door leads to the librarian's house, but the main entrance is from a staircase at the south end of the building. On an upper floor, over the south section of the building, is the picture gallery and museum, 53 feet by 35 feet. The room is roof lighted, and the ceiling is coved and panelled similar to the reference library, and has an average height of about 20 feet. The walls are wood-lined with a curved surface, for the better exhibition of the pictures, and are painted a rich vermilion. The gallery is approached from the main stair of the building, and has an emergency exit to the south staircase, which leads direct to the street. The basement floor is 4 feet below the street level, and contains receiving room, workshop, rooms for male and female attendants, newspaper store, heating chamber, &c., and also a public lavatory placed convenient to the main stair. The lavatory, &c., is finished with cream and buff-coloured glazed tiles, and the floor is laid with red and black Ruabon tiles. The whole building has been constructed with concrete floors and steel roof couples, and fire hydrants are placed on each landing, the building being, as far as possible, fireproof. Externally, as already stated, the design is Italian Renaissance. It is simply treated. The windows are necessarily large, and are so arranged that the maximum of light falls on the tables, reading stands and bookcases. The library is designed to be worked easily and with the minimum of labour, which is an important consideration. The reading tables are made of walnut and birch, the book shelves and counters of Kauri pine, and the other finishings are principally of yellow pine. The woodwork generally is of a superior quality, and has been stained and varnished. The upper walls of the upper rooms are painted in plain colours, with the columns, pilasters and window mouldings relieved in lighter tints, while the cornices and ceilings are painted in various shades of harmonious colouring. The ceilings of the entrance hall, vestibule and committee-room are decorated with a rich design of Tynecastle; and the entrance hall, staircase and upper landings have a high dado of Lincrusta A discriminating use has been made of leaded glass, slightly tinted, sufficient to give a sparkling effect here and there, but otherwise all the doors have clear bevelled plates, and the side lights and glass screens generally are of clear plate for the better supervision of the apartments. The heating is by means of low-pressure hot-water pipes and radiators, combined with an ample supply of fresh air to the pipes, and at a higher level at other points. The vitiated air is extracted at the four corners of the principal rooms on the ground floor by fireclay flues built in the walls, leading to shafts on the roof, on which are placed exhaust ventilators. The upper rooms are ventilated at the centre of the coved ceiling. The building has been wired for electric light, but meantime brass pendants and brackets have been fitted up throughout, arranged in relation to the position of the bookcases and reading-tables, &c., the supply of gas to the various sections being controlled by valves in the entrance hall. At the north-east corner is a turret, with stair leading from basement and other floors to the roof. Above the roof the stair terminates in a stone-roofed clock tower having a three-dialed timepiece.

ELECTRIC LIGHT WIRING.

THE
NATIONAL SYSTEM
IS THE
Safest, Cheapest & Most Durable.

NO WOOD CASING OR OTHER PERISHABLE MATERIALS USED.

The System possesses all the advantages of Concentric, Iron Barrel, or Conduit, at half the price, without their disadvantages.

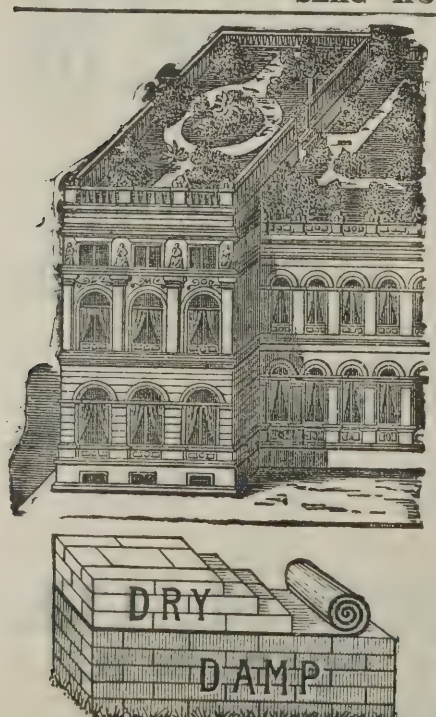
COLLEGIATE CHURCH, JERUSALEM.

On October 18 the Collegiate Church at Jerusalem was consecrated. The Collegiate Church of St. George the Martyr at Jerusalem is part of a larger building known as the Anglican College at Jerusalem. This consists of a bishop's, or warden's, house, a clergy-house and library built of white stone in the Gothic style, resembling one of the smaller colleges at Oxford or Cambridge. The architect is Mr. George Jeffrey. The site, which is on the road to Damascus from Jerusalem, about half a mile to the north of the city wall, close to the tombs of the kings, bears the name of "Tell el-Keniseh," or "Hill of the Church." It was acquired by the present Bishop of the Church of England in Jerusalem and the East in 1893, and is freehold. It is protected and assured by an Imperial firman of the Sultan of Turkey, and has been declared "Wakoof"—*i.e.* dedicated for ever to religious purposes. It is now vested in the council of the mission.

The church is built on the eastern side of the quadrangle of the college, which is 100 feet square. Offerings have been made to it from many quarters, but the most important are the grant of 1,000*l.* from the Colonial Bishoprics Fund, a font of white Carrara marble, the gift of Queen Victoria, and placed in the baptistery in the chapel of St. Michael, on the south side of the church, which will be used for the daily services, and the Litany desk, with a beautifully-carved panel representing Moses, Aaron and Hur, designed by Mr. J. Arthur Reeve, the gift of the present Archbishop of Canterbury.

AUCTIONEERS' BENEVOLENT FUND.

The annual meeting of the Incorporated Auctioneers' Benevolent Fund was held recently at the Mart, Tokenhouse Yard. Mr. Daniel Watney (treasurer) presided, and among those present were Mr. Alderman Samuel Green, Mr. Edward Tewson, Mr. F. Eiloart, Mr. C. R. Foster, Mr. G. F. Francis, Mr. E. T. Galsworthy, Mr. E. W. Rushworth, Mr. H. Wood (members of the committee of management) and Mr. W. Cudlipp (secretary). The Chairman, in moving the adoption of the report, deplored the fact that since their last meeting they had lost two of their prominent members by death, namely, Mr. R. C. Driver and Mr. C. Oakley. The amount of the grants made during the past twelve months was about 400*l.*, in addition to which some 300*l.* was paid away to annuitants. Any auctioneer who had held a license for seven years was eligible for assistance, and he thought that for this reason the fund was entitled to more liberal support from the profession than it at present received. The committee had granted a fresh annuity during the year and increased the amount of another from 20*l.* to 26*l.* Since July 1 last 80*l.* had been voted in relief of necessitous auctioneers or widows and children of auctioneers, and it was to be hoped that their resources would so increase as to enable them to give even more help in the future than they had been able to do in the past. He added that the sum distributed in annuities represented their income from investments. Mr. Green seconded the motion. Mr. Tewson remarked that no deserving applicant was ever refused aid. The Chairman said that was so, but in some cases a larger grant was needed than they were able to give. The report was adopted.



SLEDMERE CHURCH.

We recently reprinted from the *Leeds Mercury* a statement relating to Sledmere Church. A correspondent of the same journal has given the following view of the transactions which is taken from another point of view :—

May I be allowed to join issue with your reporter in several of his assertions as reported. First, as to what he terms the "Sykes's folly" and the waste of money thereon. I will pass this by, cursorily remarking that I cannot claim to be a "plain man gifted with but an ounce of common sense," inasmuch as I fail to see "the stupendous piece of folly and sad waste of money"—as characterised by your reporter—in the reproduction of some of the most beautiful Mediæval sculptural work extant by a wealthy gentleman to the beautifying and ornamentation of his surroundings, and in the erection of which much labour and "waste" money has been expended, whereby the "builders and hewers of stone," at least, have benefited financially. Far better is it that a man should spend his surplus wealth even on such monumental objects as "Sykes's folly," although perchance not reproductive from a utilitarian point of view, than squander it in gambling and riotous living.

Secondly, as to the old church which your reporter speaks of as having "stood for centuries, and which was so comfortable, &c.," I may inform him the same was an ugly, "barnlike" erection of the middle of the eighteenth century (built circa 1745), with not the slightest pretensions to any architectural

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summe than under any other roof. When properly laid repairs are never required, and all roofs ar guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost o construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 4 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower an quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and fo SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 super ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires n annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing ; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.C

beauty or design. The present most beautiful fabric is built on the site of a much more ancient edifice, the foundations of which were revealed on excavating for the foundations of the new church.

Thirdly, as to the legality or illegality of the action in demolishing the old "barnlike" structure, that question may safely be left to the Archbishop and Sir Tatton. I think his Grace may be credited with being "gifted with that ounce of common sense" of which your reporter writes.

Fourthly, as to the screen with its "five figures and cross surmounting," &c., to which the worthy baronet—after erection—appears to have taken objection, much to the "consternation of the architect"—well, such things do happen; but it is generally conceded that the man who "pays the piper should choose the tune," and as the worthy baronet has paid, and paid handsomely, he was entitled to have his way, and in this instance it is to the vicar's credit he did not intervene, as he asserts he might have done. Pity that he has not subsequently pursued the same non-intervening policy, in which case it would now have been "peace" and not "candlesticks" between the baronet and his reverence, and "temporal" supplies would not have been "cut off" as they appear to have been.

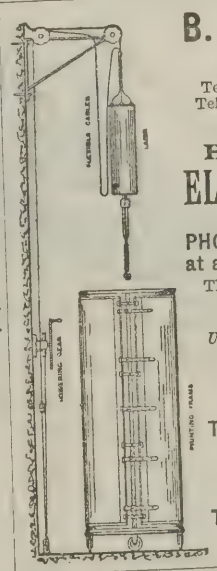
Fifthly, as to the paucity of seats in the sacred edifice to accommodate the "mythical" congregations, I can only say, from my personal experience of country churches, that it is generally the "other way about." A "plethora of seats and a paucity of congregation" is the rule, and from all accounts Sledmere Church is no exception, and not likely to be as long as the present vicar is "in office."

Lastly, as to the late vicar (the Rev. Mr. Mant) being extremely "ritualistic" in his tendencies, this he may or may not have been; but he was certainly respected by all, irrespective of sect. If he held Romanistic views, he did not protrude them nauseously upon his parishioners. There is an old and trite adage, "Those who live in glass houses should not throw stones." Had your reporter made one of the congregation at the afternoon service, or, to be more correct, "Romish function" which was celebrated on the day of the consecration of the new church a few weeks ago, he would have been treated with such an "odoriferous and spectacular" exhibition of Romish ritual, "pure and simple," as would have satisfied him for the term of his natural life. And this performance was enacted under the "ægis" of the present vicar, aided and abetted by several of his clerical brethren. The late vicar having assisted at the morning service, wisely absented himself, although "imbued with such Romish proclivities." Why did not the Rev. Mr. Romestin and his clerical confrères indulge in the "swinging of incense" and "vestments," &c., at the principal service in the morning? Why, indeed. Because, like "naughty boys," they dare not. The master was there (the Archbishop); in the afternoon the "cat was away, so the mice could play," and they did so, to the disgust of many who were unwilling spectators and who would have left the sacred edifice—as some did—could they have done so without creating a disturbance.

Whatever "remarks" the visitors to Sledmere may make relative to the church and its history, and which "remarks" the vicar "wishes were more audible," I can assure the rev. gentleman that the many, varied and not very complimentary "remarks" I have heard during the last few weeks with reference to himself and his actions have been most distinctly emphatic and audible.

I must apologise for this lengthy epistle, and my excuse must be "fair play." Sir Tatton Sykes has done much—very much—in building and restoring the churches on the Wolds at an enormous cost, and he has been a most generous patron and friend to the clergy at the same time. I am certain that the worthy baronet has the sympathy of the neighbourhood with him in what I hope may be but a "temporary friction" between him and the Vicar of Sledmere.

GERMAN TESTS OF CEMENT.



THE American Society of Civil Engineers lately issued a series of questions in order to collect the views of manufacturers and consumers about the tests of cement. The *Baumaterialienkunde*, the official organ of the International Society for the Unification of Tests of Materials, has published replies to the questions from a German point of view. It is stated, however, that very different opinions are held, even in Germany, regarding some of the methods of testing, and it is suggested that those who object to these answers should bring forward their conclusions, so that ultimately an agreement regarding standard methods may be reached. Appended are the questions and a translation of the answers:—

Sampling.—*Q.* What method is used in taking samples, and how many are taken from each shipment? Does the number of samples depend on the kind of work and on the reputation of the cement? Do you mix cement from several

packages, or are the samples from the several packages kept separate?

A. The sampling should depend upon the purpose for which the tests are made, and upon the previous tests that have been made with the same cement. Samples should be taken from different packages of each shipment, and as near as possible out of the middle of the barrel or bag.

Chemical Analysis.—Q. When do you consider a chemical analysis essential or desirable? What elements or compounds should be determined? What are the best methods of determining these compounds with sufficient accuracy.

A. Chemical analyses should be made when it is suspected that magnesia is present in large amounts, or for mixed cements. The complete analysis should be made and the limits of error should be those assigned by Fresenius. Methods should be left to the chemist.

Microscopical Tests.—Q. Are microscopical tests of value, and if so, when? What power microscope should be used, what observations made and what are the indications?

A. The petrography of Portland cement and its microscopic properties are not sufficiently developed, so that engineers and architects can use the microscope to obtain results of value.

Fineness.—Q. What sizes of mesh should be used in testing fineness of Portland cement? What for natural cement? What should be the diameter or sizes of the screens? How large a sample should be tested? Should a machine for shaking be used, and if so, what form; and what should be its manipulation? How long should the shaking be continued? Should there be any difference in manipulation for fine and coarse screens, or for different kinds of cement?

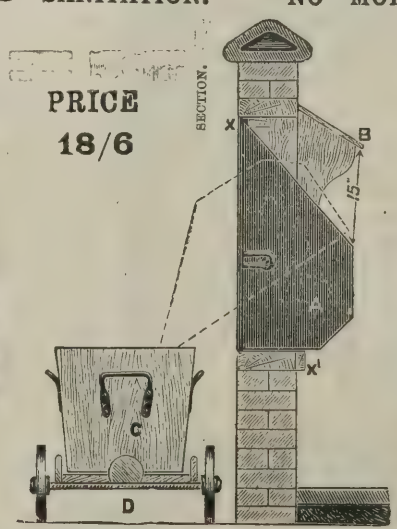
A. German standards require for Portland cement that not more than 10 per cent. shall remain on a sieve having 900 meshes per square centimetre; this requirement is now satisfied by nearly all cements, and it might well be specified that not more than 20 per cent. shall remain on a sieve having 3,000 meshes per square centimetre, and that all should pass through the sieve with 900 meshes. The diameter of a particle just passing through the sieve of 900 meshes is, since the thickness of the wire is one-half that of the clear opening, 0·22 millimetres. Plates with round holes are to be preferred to wire screens, but it is difficult to manufacture them. The weight of the samples should be 100 grammes. Mechanical shaking has not been found satisfactory, especially for fine cements, and shaking by hand is to be preferred. The shaking is to be continued until no cement is seen to fall upon a sheet of white paper held below the sieve. All kinds of cement should be treated alike in the shaking process.

Density.—Q. Is the test of weight per cubic foot a valuable one, and what apparatus do you prefer and how should it be used? Is the test of specific gravity a valuable one and what is the best apparatus?

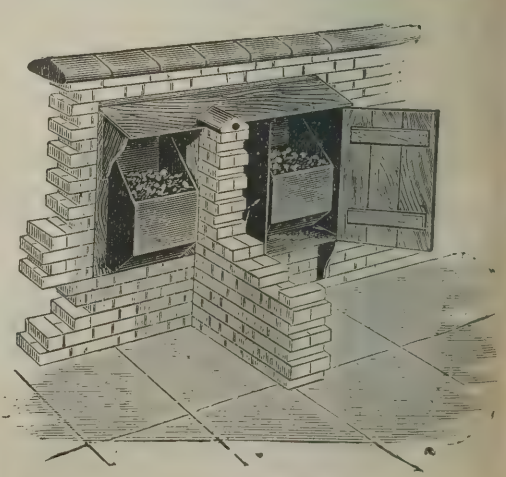
A. The weight per litre should be found both for loose samples and those firmly shaken down, and the mean of these be taken; the inclined plane of Bauschinger and the glass litre measure should be used, and uniformity in filling and striking be observed. The test for specific gravity is of some value in dealing with one brand, but its determination is not absolutely necessary; when made the apparatus of Erdmenger and Mann is to be preferred.

Standard Sand.—Q. What kind of sand should be used in tests of mortars—a natural sand or crushed quartz? What fineness should be specified, and what degree of variation in fineness of grain should be allowed?

A. The natural sand from Freienwalde, near Potsdam, has always been reliable, while crushed quartz of equal uniformity cannot be obtained. The size should range between those of sieves having from 60 to 120 meshes per square centimetre, but deviation of 3 per cent. for coarse and 10 per cent. for fine grains may be allowed.



Preparation of Pastes and Mortars.—Q. Should the same method of preparation be used for each test? How should the proportion be stated? What should be the consistency for the various tests, and how may this be specified so that the same results may be obtained by all operators? What should be the temperature of the materials used in mixing? What should be the temperature of the air at mixing?



A. The methods for the determination of the amount of water to be used in the pats for investigating constancy of volume, and those for filling the moulds in making briquettes, have not yet been definitely established, and hence the question must be left open. The temperature of the air and of the water used in mixing should be closely the same and be between 15 and 20 deg. Centigrade, and this should be noted in the record. The relative humidity of the air should also be observed and recorded.

Q. How should the quantity of water used in mixing be defined? What should be the method of mixing? Do you prefer hand or machine mixing? What is the best machine? How long should the mixing be continued? Should this be

AGENTS WANTED IN EVERY LARGE TOWN.

defined by stating the time or by reference to the character of the resulting mortar?

A. The amount of water should be expressed as a percentage of the amount of dry cement. For the pats the mixing is best done by a broad knife in a cylindrical tin can; for the briquettes by a large spoon in a bowl, by a trowel on a table or by a machine. The mixing must be uniform in tests which are to be compared with each other. The Steinbrück mixer is generally used for mortars; it has the advantage of doing the work in very short time, and does not break the grains of sand. This machine should make twenty revolutions at the rate of eight per minute for 2,000 grammes of cement and sand, with the necessary water added.

Time of Setting.—Q. What is the best method? How shall the beginning and end of the set be defined? Should this test be made on neat cement or on mortars? What should be the consistency? What should be the temperature? How shall the pats or briquettes be made and treated? What should be the temperature of the water in which the pats are placed?

A. At present the best method is the Vicat needle; other devices have not been sufficiently tried. Cement begins to set when the vertical needle sinks to about 5 millimetres above the bottom of the cake, and it has finished setting when the needle refuses to penetrate the surface. This test should be made only on neat cement. A quick-setting cement should be stirred one minute and a slow setting one three minutes, using sufficient water to make a stiff paste. The Vicat needle should be loaded with 300 grammes, and the cakes be made in hard rubber rings of 8 centimetres diameter and 4 centimetres thickness; these are filled with the cement paste and tapped gently once or twice. During the setting the cakes should be kept in a damp and warm room of uniform temperature, be protected from draughts of air and from jarring; they should not be placed in water.

Constancy of Volume.—Q. What do you consider the best test for soundness in the case of Portland cement? What in the case of natural cement?

A. German practice has led to the conclusion that there is but one reliable method of testing constancy of volume, and this is the established standard test, which is too well known to be described here.

Tensile Strength.—Q. What proportions of cement and sand should be used in mortar for tensile tests? Do you advocate adhering to the form of briquette recommended by the American Society of Civil Engineers; if not, what form do you prefer? Is your preference based on comparative experiments, or is it the result of satisfactory experience with one form?

A. The briquettes should be made of one part cement to three parts of sand by weight. The American form of briquette is inadvisable, because rupture often does not occur at the smallest cross-section. The German form is to be preferred, as experience has shown.

Q. Upon what sort of a surface should the briquette be made? Should it be finished with a trowel on both sides? What should be the consistency of the mortar? What method of filling the moulds do you advise? Do you recommend a machine for moulding, and if so, have the results been satisfactory?

A. The surface of the mixing table should be glass or smooth iron. For neat cement the briquettes should be finished on both sides with the trowel; for mortar only, on the upper side. The consistency should be such that the briquette, after a certain degree of working, exudes some mortar on its top surface. The hammer apparatus of Böhme is recommended above all other machines for filling the moulds on account of its ease of operation and its uniformity. Many years of experience with this apparatus have given very satisfactory results.

Q. How should the briquettes be treated during the first 24 hours after moulding; how during the remainder of the time? If placed in water, how often should it be renewed? Is it important that the water should be maintained at a constant temperature? What should that temperature be?

A. The briquettes should be taken from the moulds within 20 minutes after they are made, and then be kept in damp air for 24 hours and be protected from dust. They may be kept in the air until tested, or be placed under water. The water should be renewed weekly, and be kept at a temperature of about 17 deg. Centigrade.

Q. At what age should briquettes be broken for acceptance tests in ordinary work? Under what conditions would you deem it essential to make longer time tests? Will weighing briquettes before testing give information of value, and if so, what?

A. They should be broken at the end of seven and twenty eight days. Longer tests are of value when it is desired to learn the rate of hardening. Weighing is of value in determining the weight per cubic unit, and gives information regarding density which is useful in making comparisons.

SECTION.

READILY FIXED!
THOROUGHLY EFFECTIVE!
REASONABLE IN PRICE!

This Boxing obviates the necessity of "Trimmer Arches" of Brick or Stone—at the same time meeting with the requirements of the various Building Authorities.

a—Back plate of Boxing for bolting to Trimmer Joist.
b—Convex plate to carry Concrete Filling and Hearth.
c—Flange resting on chimney-breast.

Also **arranged** for fixing with loose flange if required.

The "BRIDGE" BOXING has at once commanded the approval of Leading Surveyors, Architects, Fire Assessors, and Contractors.

STATHAM & SONS STONE, SLATE, AND CEMENT MERCHANTS, SANITARY GOODS, BLUE BRICKS, ETC.
WINDSOR BRIDGE, MANCHESTER.

Q. What form of clip do you prefer? What should be the distance between opposite gripping points of the same clip? What should be the rate of applying the stress? What style of testing machine do you prefer? Can you suggest any desirable modifications to machines now in use? What special precautions are necessary in breaking briquettes?

A. The clips should be so rounded that they do not touch the specimen over its whole thickness, but only in the middle. The Michaëlis machine has proved to be a good one; if no better method of applying the stress is known, it should be done by shot or by water. The shot should be 3 millimetres in diameter, and should flow with uniform velocity.

Compressive Strength.—Q. Do you advise compressive tests, and if so, why? What form and dimensions of test piece do you prefer? Should the test piece be treated differently as regards manipulation of mortar, mixing or setting, from tensile specimens? How should the specimen be prepared for the testing machine? What form of testing machine do you recommend? What should be the rate of applying the stress?

A. Compressive tests are indispensable, because compressive strength is required in practice and because such tests give more reliable results than tensile experiments. The specimens should be cubes, having each face about 50 square centimetres in area; they should be prepared like the tension briquettes, but be left in the moulds twenty-four hours. The cube is to be so placed in the machine that the pressure comes upon two lateral faces and not upon the top and bottom faces. The 30-ton machine of Amsler and Laffon is recommended.

Transverse Strength.—Q. Do you advise bending tests; if so, under what conditions, and how? What form and dimensions of test piece do you prefer? What span? Should the specimen be prepared differently from tensile specimens? What form of testing machine should be used? What should be the rate of applying the load?

A. Bending tests are to be recommended as well as those of tension and compression. The form and dimensions of the specimens will depend upon the purpose of the test, but should be as large as possible. They should be made in the same manner as the tensile briquettes. A special machine for transverse tests has not yet been introduced, but the lever apparatus of Michaëlis may be noted as applicable.

Miscellaneous.—Q. Under what conditions are the following tests necessary or advisable?—Adhesion, abrasion, resistance to freezing, resistance to action of sea water.

A. Tests for abrasion are recommended for cements to be used in floor construction and street pavements, and tests for resistance to frost are desirable for cements which are to be exposed to the weather. For abrasion the method of the laboratories in Munich, Zürich and Berlin is reliable; this consists in grinding the specimen with emery on a cast-iron wheel. Adhesion tests may be valuable in some cases, but no agreement has been reached as to the method of procedure, and many difficulties will be found in making them. Tests for resistance to the action of salt water must be arranged according to local circumstances.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

21,273. Benjamin Cock Gliddon, for "Compound levelling rings for the setting up of gun-mounting theodolites or other scientific instruments or structures."

21,302. Herbert Pike Pease, for "Fuel-ore blocks or bricks for smelting."

21,480. Carl Axel Wilhelm Huttman, for "Improvements in or relating to channel tubes and wells for underground electric conductors and the like."

21,533. Thomas William James, for "Imitation mica marble and stone."

21,584. Ernest Homan, for "Improvements in or connected with fireproof floors, ceilings or the like."

Specifications Published.

29,020. Smith, for "Construction of bricks and other moulded building materials."

14,579. Turner, for "Tenement buildings."

15,623. Kempshall, for "Tile-making and punching tables."

To Inventors.—Patents for Inventions Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

The Architect.

THE WEEK.

THE Society of Oil Painters is an old acquaintance with a new title. At present success in it is supposed to depend on the quality of the work, but in a little time the usual course will be followed. The Society will become "royal," and the adjective will, in Piccadilly as elsewhere, be taken as a protection for inferior pictures. This season's exhibition is unusually satisfactory. Never before have we seen so many examples of honest brushwork. Mr. WATTS has shown his sympathy by sending a couple of amorini which are as vigorous as if the flesh tints were laid on by a trowel. There are several works which are qualified to be hung near it. As usual, the majority of the 465 paintings are landscapes, and the few portraits appear out of place on the walls. Architects will be attracted by Mr. FULLEYLOVE'S *Acropolis from below the Pnyx, Athens*, which, although rather dry, is accurately drawn. Sir J. D. LINTON has adopted modern costume for his *Summertime* and portrait of a lady. In the figure pieces the tragic is wisely avoided by most of the artists. Mr. J. C. DOLLMAN has a nude figure of a Christian martyr stretched on the sand of an arena, but as there is no sign of violence, how he met his death is doubtful. Mr. CECIL REA in his *Echo and Narcissus* reveals admiration for one of the modern French styles. The influence of France is unusually marked this year in figure scenes and landscapes. Mr. STOCK'S principal work is a portrait of a young astronomer drawing aside a curtain to display the stars, but there is little of a nocturnal effect within the room. Mr. BUNDY'S *The Word* is a party of Puritans wrestling with knotty points; the figures are skilfully characterised, and the effect is enhanced by the light passing through a green curtain. In his *Hareem in the House of the Sheikh es Sâdât, Cairo*, Mr. FRANK DILLON shows detail of woodwork with as much care as if he were rivalling J. T. LEWIS. Mr. HALES'S *Siren* is a new version of the old legend, for we see a mermaid luring a Greek boat to a dangerous reef.

THERE is much variety among the landscapes. Mr. F. G. COTMAN again suggests fleeting phenomena in light and shade. Mr. YEEND KING is not only successful, but has gained imitators. Mr. EDWIN HAYES has found waves off Tarifa, which, if more deeply blue, are as powerful as those of the north. Mr. PILLEAU has well rendered a calm day on Venetian waters. Mr. JOSEPH KNIGHT has a carefully executed evening scene, and Mr. E. H. FAHEY shows the play of light on leaves and water. There may not be as many representations of incidents as the public usually desire, but altogether the exhibition augurs well for the future of the Society, and deserves liberal patronage.

THE late Mr. LATIMER CLARK, who died on Sunday in his seventy-sixth year, was for the greater part of his life connected with applications of electric power. He was for a long time chief engineer of the Electric Telegraph Company. He became a partner with Sir CHARLES BRIGHT and was consulted about many enterprises, and as a partner in the firm of CLARK, FORDE & TAYLOR had to do with the manufacture and laying of thousands of miles of cables in various parts of the world. Mr. LATIMER CLARK was one of the last survivors of the band of engineers who aided ROBERT STEPHENSON in the construction of the Britannia and Conway Tubular Bridges. His brother EDWIN was the principal resident engineer, and in the excellent volumes he wrote on the structures acknowledged that he was "indebted to his brother, Mr. LATIMER CLARK, for much assistance in the descriptive portions of the work and for the interesting chapter on the Tides." LATIMER CLARK was engaged on the construction and erection of the tubes. He was one of the first to realise the future possibilities of electric force, and gave up bridge-work to devote himself to its application.

IT is not often the anticipations of an auctioneer when selling land are so exactly realised as was the case at the Mart on Friday last when two blocks forming part of the Bridge House Estates were sold. One contains 22,786 square feet and the other 18,391 feet. There are frontages to Finsbury Circus and London Wall. The lease was for a term of eighty years. The Corporation decided to offer the land in one lot, although probably there would be more satisfaction if the number was twenty. Before any bids were invited Mr. BAKER, the auctioneer, told the assembly that the letting value of ground which possessed so many advantages was 17,000*l.*, a statement which by some of the experts was heard with incredulity. The first offer was 10,000*l.*, and the amounts gradually rose to 17,000*l.*, at which sum Mr. LUDWIG NEUMANN, of Warnford Court, carried off the prize. That rent may now appear rather high for a site, but eighty years hence it is likely to be considered as moderate.

THE death of Mr. ANDREW USHER on Tuesday makes the indecision of the Edinburgh Town Council appear more remarkable. That gentleman, as our readers are aware, offered 100,000*l.* for the erection of a City Hall some years ago. He has now passed away without having the satisfaction of knowing that one stone of the foundations was laid. The citizens have occupied themselves with a battle of sites, and it can hardly be said to have ended. Last week it was decided to apply to Parliament for powers to erect the hall at Athol Place. But the committee rooms of the Lords and Commons will allow opportunities for the numerous opponents to renew the struggle. Mr. WATERHOUSE is an impartial and competent judge, who was able to consider the relations between a building and its surroundings. He decided in favour of the Meadows. But the Town Council scarcely read his report when it was resolved to set aside his recommendation. That course was not fair towards the architect, and the expenditure of money in obtaining a report which was not to be followed was not fair to the citizens.

THE London County Council propose to have a dual course to follow in obtaining a water supply for the Metropolis. It is proposed to purchase the undertakings of the water companies, and that within six months they can be vested in the Council. Another arrangement for which prompt action is required will be the connection of the mains of the various companies so that they may form a joint supply. In that way the local inconvenience which is occasionally suffered by the inhabitants of East London would be prevented. The price to be paid for so valuable a property could hardly be determined in a period of six months unless both sides are inspired by a common desire to arrive at a conclusion by agreeing to the same principles of value as a basis. Compensation for compulsory purchase is to be neglected. The suburban districts are apparently to be placed on a similar footing with the metropolitan area. If the companies' works can be acquired there will be no immediate need of a new supply, but the possession of the Wye and Towy watersheds cannot fail to affect the prices which will have to be paid to the owners of the existing works.

THE announcements of the high prices which are given for books that originally cost a trifle have induced a great many people to join in the chase after treasures. The sport has the advantage of inspiring hope, and, moreover, it enables a man to fancy he is one of the learned and to convince simple souls of his scholarship. With a little tact it is surprising what can be done by a knowledge of title-pages towards gaining esteem. Book-hunting is likely to gain votaries through the influence of Mr. J. HERBERT SLATER'S volume on "The Romance of Book Collecting" (ELLIOT STOCK), which contains general discourses entitled "In praise of catalogues," "A comparison of prices," "Some lucky finds," "The forgotten Lore Society," "Some hunting-grounds of London," "Vagaries of book-hunters," "How fashion lives," "The rules of the chase," "The glamour of bindings," "The hammer and the end." Mr. SLATER is a genuine bibliophile, and as editor of *Book Prices Current* he has peculiar opportunities for learning the fortunes of books. All the pages of his "Romance" can be read with interest.

THE PARIS OF THE MOUSQUETAIRES.

[By a Correspondent.]

IT is not unlikely that the theatrical season which has commenced may be marked by the number of performances of dramas which are derived from the great series of Alexandre Dumas, in which he has recorded the feats of D'Artagnan and his companions. Already one action in the law courts has arisen about a non-performance, and there is no better method of advertising literary and dramatic works. But who is there in England who is not familiar with the deeds of the heroes, or is not prepared to join in Thackeray's tribute to the author who was one of the world's benefactors? "O thou brave, kind, gallant old Alexandre!" he wrote. "I hereby offer thee homage, and give thee thanks for many pleasant hours. I have read thee (being sick in bed) for thirteen hours of a happy day, and had the ladies of the house fighting for the volumes." Thackeray was not ashamed to acknowledge how he relished the works of Alexandre the Great, and thrilled over the "Three Musqueteers." Every reader whose mind is in a healthy state would agree with him. That is inevitable. The musketeers correspond with the romantic elements which are somewhere in every mind, and which, however carefully suppressed, are always ready to display themselves. The musketeers were a law to themselves. In England we are all law-abiding and reverential to common and statute law, but the crowds of old and young folks that Mr. Punch always attracts is a proof that a fictitious rebellion to laws is not without interest. An architectural Punch who would show defiance of the Local Government Board, its by-laws, borough surveyors, district surveyors and all the myrmidons who make war on taste in the shape of projections, would have more success at the meeting of an architectural society than any exhaustive paper. It is no doubt very blameable, but men because of their weakness enjoy the conflicts between the royal mousquetaires and the cardinal's guards in Paris, and are gratified when D'Artagnan proves that he is a more able diplomatist than Richelieu and can foil Mazarin. We may not with all our admiration wish that Charles I. had adopted the stratagem of the dauntless four and slipped into the hole excavated beneath the scaffold; but in a great many countries where there is no hero worship of Cromwell, readers must agree it was a pity the king had not the courage to make use of so simple and effectual a resource. However, great and small people in London were too dull for such fine fellows as D'Artagnan & Co., and the streets were not well adapted for their peculiar adventures. That they were able to do so much among us was due to their genius.

The streets of Paris, on the contrary, were as suited to the needs of roystering bands as if they had been specially arranged for the display of agility like the scenes in old-fashioned pantomimes. It would be absurd to consider the descriptions of the streets and houses in Dumas's pages as archæological documents. But there is enough confirmation by contemporary authors of what he says. For instance, the "Vicomte de Bragelonne" commences in May, 1660. Now the sixth Satire of Boileau bears that date, and it reveals in a very concise form the condition of Paris at the time. The poet evidently was thinking of Juvenal's experience in Rome when he wrote the verses. He speaks of the noises which kept him awake at night. If he rushed into the streets they were so narrow and overcrowded he was almost crushed to death. He could not walk in one part, for he was likely to be killed by waggons; elsewhere there was the danger of slates and tiles falling from the roofs. If a cart-horse fell the street became blocked. If rain fell the street became a pond, and it needed a strong head to cross on the narrow rickety planks which were balanced on a couple of paving-stones. When the poet found he must once more return to his house, it was with fear he walked through the streets, for robbers went about in parties of four. It was vain to attempt to sleep. His windows were broken by bullets which pierced the shutters, and he could hear cries on all sides of "Au meurtre! On m'assassine!" Sometimes the cries were of a different kind, and announced that one or more houses near him were on fire. According to Boileau it was only the fortunate people who possessed a large house with a garden around who could expect to sleep and live undisturbed amidst the turmoil of Paris.

In 1660 Louis XIV. may be said to have commenced his reign, and the wild days of the musketeers were ended. If possible in the preceding period the condition of Paris was less like the modern city. But in reality there was little change. Paris was not in those days often subjected to improvements. The municipal authorities did not care about the condition of the streets, and the uncertainties of a State made up of conflicting elements made people who owned houses indisposed to lay out money on them. One of the first efforts of Colbert, when he became a minister, was to compel the outlay of 137,000 livres or francs in one year on the paving of the city. Care was taken to avoid so much extravagance, and a third of the sum was supposed to be a liberal allowance for keeping the streets in a condition that would facilitate traffic.

It might be supposed that with streets which presented innumerable obstacles to unwary travellers, an attempt would be made to utilise efficient lighting in order to diminish the risks for those who walked as well as those who were carried. Not until 1688 was there any systematic arrangement for lighting the streets. The means were even then of the simplest. It was decreed that lanterns, each having a candle, should be provided at the expense of the different quartiers. The transformation from darkness to light was so remarkable, Louis XIV. utilised it as an opportunity for having a medal produced with his likeness and the legend *Securitas et nitor*. At the end of the century the number of lanterns was calculated to be 6,500. But although limited, the citizens considered them to form one of the most gratifying of all the king's innovations.

The candles alone could not have wrought so remarkable a change if there was not another factor no less important. The musketeers were always able to find armed men on whom to test the sharpness of their swords. All who liked could carry arms. Most gentlemen considered it was their privilege to have armed servants, and a great many rogues and vagabonds contrived to wear long swords. An order for the prohibition of weapons unless the bearers were licensed was treated with indifference. It became necessary to hang some valets, in spite of the protests of their masters, before the feudal practice was set aside. Still there were insults committed from time to time by swashbucklers, who were insolent by the operation of the law of heredity. Towards the end of the century an edict had to be issued which prohibited all domestics from entering the public gardens of Paris, and it was only by that sort of rigorous action the desired order was insured.

It will be asked, Had Paris no guards to prevent disorders? The protectors of the public in London in the seventeenth century were a different race from the excellent constables who now keep order in the streets. We must not therefore blame the French if in their capital the guardians of the peace resembled wolves in charge of sheep. Most of the robberies and disorders which occurred at night were ascribed to soldiers of the royal guards and cavalrymen from different garrisons. The former were notorious thieves. There were bands of criminals who claimed to have privileged districts or sanctuaries. Readers of Victor Hugo "Notre-Dame" will recollect the Cour des Miracles. It continued to be a refuge for truands until the time of which we are speaking. A military attack was made on it, and the defenders were three times summoned to surrender. They refused, and forced the assailants to retreat. The place was then besieged in regular form. An opening was made in the walls and possession of the cour was taken. But those who held it were allowed to escape, and a great feat was supposed to be accomplished when the walls were demolished.

The vagabonds had many other haunts, such as the enclosure of the Temple, and they claimed a right to some of the ground on which St. Germain des Près stood, which was a heritage of the scholars of Paris. It was also claimed by the owners of the Hôtel Soissons, near St. Eustache, that they were able to offer an asylum to all sorts of outcasts. But more remarkable still was the curious circumstance of the royal palaces of the Louvre and the Tuileries serving as cities of refuge to criminals. Through

COLBERT'S perseverance and courage all those asylums were closed against outlaws.

For exterminating the dangerous classes there is no more effectual way than improvements of streets on an extensive scale. LOUIS XIV., although a lover of architecture, does not appear to have cared much about the improvement of his capital. He preferred to give his attention to places like Versailles, where he could reign in all his glory. In the king's name, however, COLBERT contrived to execute many important works. He constructed an academy of architecture, but, as VOLTAIRE shrewdly says, "C'est peu d'avoir des VITRUVES, il faut que les AUGUSTES les emploient." The greatest works which were raised in Paris during the reign of LOUIS XIV. were the Invalides, the colonnade of the Louvre, the arches of Saint Denis and Saint Martin.

The improvements of streets few people care to trace, but they were less welcome to the citizens of Paris than those of HAUSSMANN a couple of centuries afterwards. Who can now realise there was a *butte* or hill near the spot where the church of St. Roch was erected? The removal of it was supposed to be costly and troublesome. Consequently, when the pig market was removed to make room for the Palais Cardinal, now the Palais Royal, and the skinners' and tile makers' yards were changed into the gardens of the Tuileries, the *butte* was left. An order was made to level it in 1667, but the work was not thoroughly done, although several years were occupied with the task. That one improvement led to several, and access to the Tuileries and Champs-Elysées became easy. The latter place received its mythological title from LOUIS.

In the reign of LOUIS some lengths of quais were constructed. Although they now appear an indivisible part of Paris and one of the elements of its amenity, they were not much admired at first. The Parisian loves liberty, and his beloved river appeared to him to be entitled to follow its own course. Our fathers, says LAVALLÈE, forgave the Seine its caprices, storms and floods so long as they were enabled to enjoy the verdure of its willows and reeds. It was easy for them to float on its surface, their houses and mills were washed by its waves, the river was allowed to approach their tan-yards and bleaching-fields as a friend. For a long period they never attempted to do more than erect a few *palées* or rows of stocks and some timber *estacades* when the Seine was compelled to be restrained.

When it was found that the Court and Ministers had taken up the improvement and extension of Paris the citizens were alarmed. In those days history was supposed to afford examples of warning; accordingly it was concluded that as in many ancient cities splendour was the prologue to ruin, Paris was doomed to decay if it adorned itself or sought after enlargements. COLBERT under the guise of royalty was not to be scared; open spaces like the Place Vendôme, the Place des Victoires and the Carrousel cannot be called immense, but they appeared as omens of destruction at the end of the seventeenth century.

If His Majesty bore the expenses of the metamorphosing of the old city there might be less grumbling. But a most oppressive innovation was found in decrees of 1672 and 1678, which compelled those who benefited by the improvements to recoup the expenses. It was also decided that in all new streets a regular line of frontage was to be laid down and respected. A plan of Paris was preserved which was to serve as a guide for those who wished to rebuild. The king announced how he intended that Paris should present an appearance which would make strangers realise how great was the kingdom of which it was the capital, and how happy were the inhabitants with such a king as then reigned. Yet, at the close of the seventeenth century the severest punishments were necessary to put down bread riots, and the worst culprits were the ravenous soldiers of His Majesty's army. Then, as now, splendour and starvation were closely allied in Paris.

D'ARTAGNAN'S versatility, according to ALEXANDRE DUMAS'S chronicles, was fabulous. By the officer's own account he was rather staid, and that is the impression we derive from Madame DE SÉVIGNÉ'S reference to him in connection with the FOUQUET trial. But as a man who could play many parts he changed his residence from time to time, and they all appeared to be adapted to the work he had to do. When out of favour he was despondent, and imagined he was growing an old fogey, and could therefore recall his early days in Paris. "When I think," he said, "that we used to be besieged in our houses, like PRIAM and HECTOR in Troy. How the women wept and the walls rejoiced. Five hundred rascals clapped their hands and yelled 'Kill! kill!' although they could not hurt one of the musqueteers." The rickety old houses to D'ARTAGNAN'S mind ought to be happy for having a part in the scrimmages. In MAZARIN'S time, when he was lieutenant, he lived in the Rue Tiquetonne in an attic. He was not more surprised when he found a man breaking in through the window in order to escape arrest than was Captain COSTIGAN in Shepherd's Inn when JACK AMORY came to him along the gutter. The Rue Tiquetonne, which once was known as Quiquetonne, is a very short but ancient street off the Rue Montmartre, and near the Halles Centrales. There was a market in D'ARTAGNAN'S times, but it was very different to that now existing, which, according to EDMOND ABOUT, is, as an example of construction, more remarkable than the Hanging Gardens of Babylon, the Parthenon and the Louvre. In the seventeenth century part of the site was occupied by the pillory, which was a structure that revolved, and was therefore more disagreeable than the English appliance. The church of St. Eustache was also in the neighbourhood, and close to it was the column constructed by JEAN BULLANT to enable CATHERINE DE MEDICIS from the summit to pursue her astrological investigations. In our time a gentleman who lived in the Rue Tiquetonne would make his way as quickly as he could to the boulevard, but in the seventeenth century that was not a place of resort. The boulevard was then a survival of a rampart which was raised in 1536 as a protection against the English. The wall which strengthened it had fallen into ruin, and by order of LOUIS XIV. was demolished, with the exception of the two triumphal gateways. D'ARTAGNAN occasionally accepted hospitality from his former servant, who had become a grocer in the Rue des Lombards. That street is on the other side of the Halles, and derived its name from the Lombards who were the usurers of Paris. It bore other names, but only temporarily, in order to save the reputation of the street. From either lodging it was no great distance to the Palais Royal, which in those days was the centre of government. DUMAS was not a stickler for the accuracy of his backgrounds, but the adventures of the musketeers are described by him as happening in parts of Paris where they would not be out of place. DUMAS had sufficiently studied the topography of Paris to be able to keep within the bounds of probability.

ST. ALBANS CATHEDRAL: THE SHRINE.

ABOUT forty years ago the Rev. Dr. Nicholson, who was rector of St. Albans, discovered during some operations in the lady chapel a great many fragments of carving, which he supposed were a part of the shrine of St. Alban, which was destroyed after the Reformation. On February 8, 1872, a similar discovery of about 300 pieces in Purbeck marble was made in the south aisle of the church during the works which were carried out under Sir Gilbert Scott's direction. It was found there was affinity between the two collections of fragments, and a search for more was rewarded. The discovery was then made that they all belonged to the ancient shrine, and drawings were prepared with their aid to suggest the work as it appeared. The discovery excited, as might be expected, unusual interest among architects and other archæologists. The following description of the shrine by the late E. W. Godwin, F.S.A., was printed in *The Architect*, and suggests the appearance of a work which was the principal attraction of St. Albans Abbey:—

The sixteenth abbot of St. Albans, Geoffrey de Gorham, who ruled from 1119 to 1146, was a man of mark in the art world. Among the very many works which he encouraged, foremost in artistic interest was the new châsse which he caused to be made for the relics of St. Alban. De Gorham's successor stripped this work of all its valuables and sold them. Luckily, however, he was compelled to resign in favour of the nephew of Gorham. This was in 1151. The artist (a goldsmith) who made or designed the châsse was now a monk of St. Albans, and the abbot commissioned him to renew the work which had been removed. The shrine was not completed until the next abbot ascended the chair. During his time, between 1167 and 1183, it was finished and raised, so that its splendour might have a greater effect.

And here it may be as well to make clear to our readers the

combination popularly called a shrine. First of all is the architural base pedestal or stand, the common form of which was that of a canopied or honeycombed altar-tomb, occupying the centre of the space immediately behind the altar. Sometimes the canopy was in the form of a roof, and sometimes it was flat-topped. So far the work was fixed and architectural, and was nearly always built up with stone or marble. The second thing to note is the feretrum. This was usually the most magnificent feature in a church. It was often made of metal, and was usually enriched with precious works in silver and gold, jewels and enamels. This was placed either under the roof-like canopy, or on the top when the canopy was flat. In the latter case, however, it would always either have a canopy of its own, still more elaborate than the one below, or a cover (coopertorium) raised by ropes over pulleys fixed to a beam or the ceiling of the church. Indeed, this cover or case might be used with or without a fixed canopy. The third and last object was the châsse, which was enclosed or enshrined by the feretrum. This châsse was nothing more than a coffin of stone, wood or metal, containing the mortal remains of the person for whom the shrine was erected.

It was the châsse which Abbot Geoffrey de Gorham caused to be made (1119-46); it was the châsse which was stripped of its valuables by his successor; it was still the châsse which Robert de Gorham (1151-66) had restored; but it was the feretrum and the architectural pedestal with which Abbot Simon's (1167-83) name is identified.

This feretrum was formed with a top like a simple gable roof. On the sides were gold and silver figures in high relief, representing scenes in the history of St. Alban. At the west end was the decollation of St. Alban, and above it in the gable an image of the Blessed Virgin, throned, having on her lap a figure of the Holy Child. The whole of the east end was occupied by a crucifix, with the figures of the Blessed Virgin and St. John. All this work was in high relief and set with jewels and ornaments of gold. On both sides of the roof the story of the martyrdom was continued, and the ridge was finished with a crisp cresting. The feretrum was raised upon a lofty pedestal or altar-tomb, and protected by a canopy of considerable height, supported on pillars covered with plates of gold, and made hollow like small towers pierced with open arcades and decorated with bosses of crystals. At the time when the shrine was finished the days were peaceful and pleasant, but before long the abbey suffered from bad rulers. The fever of rebuilding attacked the house, architects and masons came in with bad advice and the monastery grew embarrassed. The new works were suspended and quickly became a ruin, and, worse than all, John was king in England. The evil day passed and a new art era began. The central figure of this happier time (artistically speaking) was one Walter de Colchester, sacrist, whose works in painting and sculpture were the objects of constant praise. The influence of this artist, supported as he was by Mathew of Paris, by the Treasurer and the Keeper of the Seal, must have tended to establish a reverence for all art work, and must have contributed in no small measure to the final elevation of that central feature which was the very *raison d'être* of the abbey itself. It was in their time, just about six centuries ago, the builders of some work then in progress discovered the old tomb of the martyr. We are told that there was much rejoicing on this happy occasion. It brought a train of devout, and possibly curious visitors, and one distinguished ecclesiastic went so far as to grant so many days' indulgence to those who were fortunate enough to be present at the find. What amount of indulgence this liberal prelate (had he lived till now) would have granted to the Rev. W. S. Lawrence, to Mr. G. G. Scott, to his clerk of works, Mr. J. Chapple, or to that indefatigable foreman, Mr. Jackson, for the parts they have taken in the discovery and piecing together of the broken and battered fragments of the last shrine pedestal of St. Alban it is impossible to say; for a Mediæval churchman might have regarded the work of restoration which has lately been accomplished as performed by the help of something other than human hands or mortal brains. Whether they would have been canonised or the reverse, certain it is that nothing we have it in our power to offer can repay the labour of love which has been bestowed in the discovery and reunion of the fragments of the architectural pedestal which was erected on the completion of the new works in the presbytery to support the feretrum above noticed.

Already the greater portion of this pedestal has been exhumed and put together *in situ*. To describe it as a canopied altar-tomb would be wrong, for what would constitute, in common parlance, the slab of the tomb is occupied by longitudinal, transverse and diagonal partitions 2½ inches thick, cutting up what might have been a single canopy into ten perfectly distinct niches. It is, therefore, more correct to speak of this fabric as the pedestal of the shrine of St. Alban. It consists of two stages about 9 feet high from the floor. The main structure measures 8 feet 6 inches from east to west and is 3 feet wide; it is divided in its length into four bays, and one bay or compartment occupies each end. Between each compartment, and also at the ends, are square piers about 4 inches by 2½ inches thick, standing a few inches clear of the main structure, and united to it at the top by flying buttresses and by intermediate transomes, crested and trefoiled. The lowest stage of the pedestal, which is 3 feet 2½ inches from the floor, is composed, first, of a step 4 inches high, at the edge of which, on the north and south sides, were three columns of a trefoil plan and triple-twisted. Upon this step is a plain plinth, also 4 inches high; and upon this stands an exquisitely moulded base, 3½ inches high, having fourteen spurs similarly moulded, each measuring 9 inches by 6 inches. These receive at their ends the panelled piers of the flying buttresses. The compartments of the lowest stage are occupied by large, elaborately-moulded quatrefoils, each foliation being again trefoliated. The side quatrefoils are regular, and are enclosed within squares, but those at the end are irregular, being of greater width, and are extremely ugly in consequence. Nor is the case improved by the addition of a dividing mullion. The upper stage is honeycombed with niches separated by 2½-inch partitions. The sides and back of each niche are covered with panelling of mullions and tracery, the sides in two severies, the back in four. These are coloured alternately red and blue in the tracery and vaulting; gold fleur-de-lis, the lions of England, some gold stars and a powdering composed of six dots round a centre dot form the coloured decoration of the upper part of the niches. The vaulting is carved out of solid clunch through the entire thickness of the pedestal. The fronts of the niches are spanned by cinque-foliated arches, the foliations being again trefoliated. Above each arch is a sharply-pointed crocketed pediment, having its finial in the foliage of the cornice. In the tympana of the side pediments are masses of carved foliage and in the wall space between the pediments are throned figures, 14 inches high, of kings and abbots, supported on small brackets. In the eight half spaces at the four angles are standing angels censing; the side ones are 11 inches and the end ones 15 inches high. We have seen that the width of the end being greater than one of the side compartments, the panel in the lower stage has been somewhat grossly broadened in order to fill up the space. In the ends of the upper stage there is no such shirking of the difficulty; here, as at the sides, we have the arch beneath the pediment; but the artist has divided the opening by a mullion and made a two-light opening of it; in the spandrel thus formed under the head of the main arch is introduced at the east end a throned figure of king Offa, whilst in the tympana above we have in the east the scourging and in the west the decollation of St. Alban. The cornice, which is 6½ inches deep and 4⅛ inches in projection, comes immediately on the top of the heads of the figures on the wall space, and the lower member of the cornice forms the necking of the finials of the pediments. The greater part of the cornice consists of a great hollow filled with foliage marvellously undercut, and on the top of this cornice rests a slab about 5 inches thick, having its edge wrought in low relief, and close to its edge on the top a series of holes 5½ inches apart, and all a quarter of an inch in diameter, with six exceptions; these six holes are at the four angles and centres of the sides, and are three-quarters of an inch in diameter. With the exception of the clunch already mentioned, all the work is of Purbeck marble and exquisitely wrought. It will give some idea of its delicacy when I say that in ribs 1 inch thick there are no less than seven mouldings (two hollows, two beads, two ogees and a fillet); nor is this an exceptional bit. The whole structure is replete with a delicacy and crispness which suggests metal rather than stone, whilst the design, especially that of the isolated parts, indicates an unmistakable metallic parentage.

Such, then, is the general description of this pedestal. But there remains to be noted two or three special features. Beautiful as is the work, instances have been discovered of even the Mediæval workman's forgetfulness; small junctions and intersections have been forgotten, and tiny bits subsequently let in and fixed with pitch. Again, in the carving of the crockets, there is a most extraordinary change: those at the east end are more modelled, rounder and later looking than the others; those at the west end look as if made in separate pieces of wrought-iron, and then turned to marble. Then, too, the floor of the niches is sunk 1¾ inch below the front string-course, so that any object within the niche could not slip out; and the top slab which rests upon the cornice, and in which is supposed to have been fixed the metal canopy of the feretrum, is designed in the most distinctive early thirteenth-century style, or a century earlier than the rest of the work.

There are also three kinds of figure sculpture. The throned figures, the angels and the groups. There can be no hesitation in assigning the figure of Offa in the eastern arch to the first rank. Closely following this are the seated figures at the side, especially the headless one, holding a spear in his right hand, where the drapery is most delicately arranged and rendered; but in the angels there is a certain crudeness visible, which

culminates in the groups. And here, again, there is an unmistakable look of cast metal and of an earlier type of figure.

To sum up—the pedestal appears to have been either made from a design for, or models of, metal, or to have been executed by men accustomed to work in metal. There is evidence of two very different kinds of handling in the sculpture and carving, and I take it, therefore, that the design is the work of a goldsmith, and that the designer himself probably executed the best bits. The top slab appears to be of a much earlier character than the rest. It possesses the characteristics of early thirteenth-century carving, and has nothing in common with the other part of the structure, except its dimensions. It is just possible it may have been copied from the crest of the earlier feretrum; but if not, can it have had anything to do with the shrine? Is it too late to be a part of Abbot Simon's completion? It is clearly too early to be anything else. Abbot Simon died in 1183; and bearing in mind the position of the abbey geographically, politically and otherwise I am disposed to venture the opinion that we have in this important discovery the whole of the last pedestal and a fragment of the second, that once upheld the body of our proto-martyr.

I may add that the general work of restoration, so far as it has gone, has been highly conservative, and that Mr. Miskin, the contractor, is executing his work in a manner alike satisfactory to the architect and antiquary.

The history of the shrine, &c., may be briefly given as follows :—

A.D.
286. St. Alban scourged and beheaded.
c. 430. His grave opened by Germanus to receive relics of other saints.
790. Offa, king of the Mercians, admonished by a dream to seek the body and place it in a shrine.
A ray of fire (very suggestive of the Star in the East) points out the burial-place.
A shrine or châsse is made, and, enriched with plates of gold and silver, receives the body; Offa placing a circle of gold round the scull incribed with his name and title. The châsse is then set up in the first church of St. Alban.
930. The châsse is broken open by the Danes; some of the bones are carried into Denmark, and there placed in a costly shrine.
c. 994. Danes ravaging. The châsse and relics secured in a chest, and hid in the walls of the church.
1077. The abbey rebuilt.
1115. The church consecrated.
1129. A new châsse made, and the relics translated. The bones taken out singly and numbered. The artist was a goldsmith, named Anketill.
1146-51. Anketill's châsse despoiled, and its valuable and curious work sold.
c. 1152. The chasse restored by Anketill.
1167-83. A feretrum (bier) made to contain the châsse, and an altar-tomb erected on which to place it, the whole covered by a canopy decorated with plates of gold and crystal. This is the work Mathew of Paris saw and described as the most splendid he had ever beheld.
c. 1230. Improvements in the buildings going on. Walter de Colchester, artist.
1257. St. Albans tomb discovered by workmen under the pavement, between the altar of St. Oswin and that of St. Wulstan. In it was a piece of lead inscribed, "In this tomb was found the venerable body of St. Alban, the first martyr of England."
In the same year the bier or feretrum was carried to the church of St. Mary-in-the-Fields, to stay the plague of rain, and the usual miracle was performed—the rain ceased.
1302-08. John de Marinis, abbot. He caused the tomb (*i.e.* the pedestal) and feretrum of St. Alban to be removed from the place where it stood, and the marble tomb (pedestal) we now see to be constructed at a cost of 820 marks (Thomas of Walsingham).

BUILDING ON THE CHRIST CHURCH SITE, BIRMINGHAM.

ARRANGEMENTS have now been completed, we understand, says the *Birmingham Post*, for the granting of a building lease of the important Christ Church site, which comprises 2,475 square yards, and is bounded by New Street, Paradise Street, Colmore Row, Waterloo Street and Christ Church Passage. Messrs. Bloxham, Smythe & Etches, the solicitors to the Colmore Trustees, advertised about a year ago for tenders for letting this land on building lease, and a number of schemes and offers were considered, with the result that one submitted by Mr. Oliver Essex, architect, with whom is associated Mr. H. Travers Edge, solicitor, and several other influential local men, has been accepted. The lease will be for a term of 150 years from Lady Day next, at a progressive ground-rent, the maximum rent being attained forty years hence. Possession of the site will be given at once, and the lessees will commence to remove the present church fabric forthwith, so that building operations may commence early next spring.

The site also includes several shops in New Street and Christ Church Passage, now let on leases expiring in June, 1902; but it is expected that arrangements will be made to acquire these at an earlier date, with a view to completing the whole of the building at one time. Should there be any difficulty in this respect, the greater part of the building will be proceeded with, and the small portions temporarily omitted will be finished as soon as possession can be obtained.

The lease contains a covenant by the lessees that no building erected on the land shall at any time be used as a place of worship (other than in connection with the Established Church of England), or as a licensed place of public entertainment, or as licensed premises to be used as a public drinking bar, or for the purpose of carrying on any other than retail trades or business, or for working thereon any machinery. With this exception, that the lessees shall not be restricted from using the area now occupied by No. 3 Christ Church Passage, and Nos. 72, 73, 74 and 75 New Street, for the purpose of a restaurant, hotel or other fully-licensed premises. A design has been submitted by Mr. Essex to the Colmore Trustees and approved of by them. Mr. Essex has been engaged upon this scheme since February, 1897, when he formulated a design for dealing with the church site only. But at that time the site was acquired by the Colmore Trustees, who subsequently added to it the part occupied by the shops in New Street, so he has now extended the plans to cover the larger area.

The present scheme provides for handsome shops in New Street and Colmore Row, while the ground-floor treatment in Waterloo Street and Christ Church Passage will be suitable for insurance and professional purposes. The upper floors will be devoted to high-class professional and other offices. Availing himself of the considerable difference in the levels surrounding the site three distinct entrances are provided, which will be situated in New Street, Colmore Row and Waterloo Street, each of which will enter the building on a different floor. The one from New Street will enter a large hexagonal courtyard covered with an ornamental glass roof and constituting a lower ground floor, the surrounding rooms being under the shops and serving as show and stock-rooms, which can either be let with the shops or independently. The basements to the shops are on a lower floor still, and approached by an inclined way from Christ Church Passage, forming an entrance into a lower courtyard for the distribution of goods in connection with the shops. These store-rooms will be reached from the shops by staircases separated from, but passing through, the intermediate floor. The plans also provide for a high-class restaurant at the corner of New Street and Christ Church Passage. A mezzanine floor is formed over the shops in New Street, which will be either available as show-rooms or offices. The building will be provided with two electric lifts, one near to New Street and the other next Waterloo Street, with spacious entrance-halls, in connection with which there will be rooms for attendants, inquiries, parcels and telephones. The offices are so constructed that self-contained suites can be let with strong rooms and separate lavatories.

The exterior design, which will be executed in stone, with grey granite base and red granite columns, will be in a free Renaissance style of architecture, aiming rather at original treatment rather than following any particularly stereotyped form, with as monumental a character as is consistent with a building of this commercial class. The prominent features in the New Street and Colmore Row façades will be large central gables, supported by turrets finished with copper cupolas. The circular front facing Paradise Street will have a colonnade of granite pillars running through two storeys above the shops, over which there are two other storeys, the whole being surmounted by an imposing dome. Stone bay windows will also be largely used in the principal elevations.

Considering the importance of its position in proximity to the council house, town hall, &c., and the desirability that the building should be worthy of such a site, application will be made to the public works committee to treat it as a special building as far as the projection of bay windows, cornices and architectural features is concerned, instead of being limited by the exceedingly small projection now allowed by the city by-laws. With a view to meeting any difficulties which may arise owing to the vexed question of rights of light, the design has been so contrived that portions of the upper storeys can be recessed, in the form of terraces, with ornamental balustrades, without interfering materially with the general effect of the design, and so that these omitted parts can be afterwards added when such rights of light have become extinguished by the expiration of leases which have only a comparatively few years to run, as satisfactory arrangements are now being completed with the freeholders of the property in question.

These buildings, which it is estimated will cost upwards of 80,000*l.*, will be carried out under the superintendence of Messrs. Essex, Nicol & Goodman, architects.

OPEN AIR SANATORIA.

A MEETING was held in York on the 27th ult. for the purpose of making arrangements for erecting a sanatorium near the city in connection with the National Association for the Prevention of Consumption.

Sir William Broadbent said that until quite recently the idea had been that consumption ran in families, that it was a manifestation of the hereditary tendency with which there was no dealing, and that a cure was a thing to be obtained under quite exceptional circumstances, and those who could afford it had gone to the Riviera, Switzerland, in fact, all over the world. As he had already said in another place, it was not any particular air that was required for the cure of consumption. It was simply air, and there could be no doubt whatever that if, in all parts of the country—in Yorkshire, as elsewhere—if these homes were managed on the principle of treatment by fresh air, the very best possible results would be obtained. Edinburgh could not be said to have a better climate than Yorkshire. At Edinburgh the results of the open-air treatment, which had been going on for years, had been admirable, much surpassing anything that could be obtained in the best consumptive hospitals not managed on this principle. What one hoped, then, what one desired, was that there should be in every important centre of population an institution for the open-air treatment of phthisis. Certain requirements were necessary—dry soil, the minimum of moisture in the atmosphere and freedom from dust. But these were conditions which could be met with more or less perfectly in all parts of the country. Therefore in all parts of the country consumption could be treated with much greater success than had hitherto attended its treatment. It had been the realisation of this idea that consumption could be cured, and the further knowledge at the same time that it could be treated successfully—even more could be done for its prevention—which had led to the formation of the Society which he came there more or less to represent. At present it was only in the early stage, and he was simply chairman of the organising committee. But the Society has already attracted a considerable number of adherents and a great amount of attention. One of the great objects was to promote local efforts, such as were being made there for the provision of local sanatoria for the treatment of consumption.

Mr. Malcolm Morris said the first open-air sanatorium was founded in Germany in 1874, that practical nation, even before the facts were proved, beginning to treat people in the open air. They began to recognise the fact that when people were shut up, every crack and crevice shut up, and people kept in a superheated room, they die with enormous rapidity. And they found when they opened the windows and doors and ventilated the whole place, or treated the patients in a tent, they began to recover. So they went on quietly working up to the time when the great pathologist, Koch, discovered the microbe which caused the disease. When the facts were proved the Germans set to work and built more sanatoria, and the merchants of Frankfort had built a hospital for the reception of these cases, which had been a great success. It was not a passing doctor's fad. It was an established fact that when people were treated in the open air they got well more quickly than when treated in their own homes. They did not want these buildings to be run up all over the country simply because there happened to be a cry on the subject at the present moment. There must be the most careful selection of soil, protection from the north and east; they must have every protection taken. One of his personal fads was that it would be of the greatest advantage if they could obtain permission from the County Council to erect these buildings of wood, and not of stone or brick. It would be such an advantage to have cheap buildings so that alterations might easily be made, and the cost of wooden sanatoriums would be only about one-quarter of the cost of more substantial erections. There were objections as regards fire, but his idea was to put up small buildings to accommodate forty or fifty beds, because it was contrary to the spirit of the English people to be crowded together in big buildings. They wanted to make these places as bright and cheerful and as much like home as possible, for it would be a disadvantage if they did away with the home element.

They could also set the example of never shutting their bedroom windows at night, and they could influence employers of labour to ventilate their workshops. He saw a clergyman before him, and he hoped he should be pardoned when he said that there were no places where tuberculosis was spread so much as inside churches. They were never ventilated, or very rarely. They could not enter a church or cathedral without perceiving a stuffy, damp odour, which meant want of circulation. He was certain that if they could make people open their windows and ventilate more, there would be very little consumption in the country.

Sir James Crichton Browne said these sanitoria, when established, would be of inestimable benefit. They would obviate that expatriation, that banishment, which added to the pangs of home sickness and separation from friends and developed the effects of the disease; they would give home comforts which could not be obtained abroad, and would keep amongst the people large sums of money which were now spent in foreign health resorts and that would be an economical benefit to the country. They were not there to represent to them that there was only one system of treatment of consumption, sanitoria or any other, which was of universal application. On the contrary, they held that there were various groups of consumption that required entirely different kinds of treatment, and every individual case required individual adaptation; but they held that there were conditions of life and environment which were essential to the successful treatment of the disease.

THE LATE SIR J. T. GILBERT.

IN the *Irish Monthly* the subjoined list is given of the larger works and official publications of the late Sir J. T. Gilbert, LL.D., F.S.A., M.R.I.A., the Irish archæologist:—

Historic Literature of Ireland, 8vo., 1851; Celtic Records of Ireland, 8vo., 1852; History of the City of Dublin, 3 vols. 8vo., 1854-59; Public Records of Ireland—Letters by an Irish Archivist, 8vo., 1863-64; Ancient Historical Irish Manuscripts, 8vo., 1861; History of the Viceroys of Ireland, 8vo., 1865; History of the Irish Confederation and War in Ireland, 1641-49, 7 vols. 4to., 1882-91; Contemporary History of Affairs in Ireland, 1641-52, 4 vols. 4to., 1879-80; Jacobite Narrative of War in Ireland, 1 vol. 4to., 1892; Documents relating to Ireland, 1795-1804, 1 vol. 4to., 1893; Narrative of Maria Clementina Stuart, 1719-35, 1 vol. 4to., 1894; "Crede Mihi," the most Ancient Register of the Archbishops of Dublin before the Reformation, A.D. 1275, 1 vol. 4to., 1897; An Account of Parliament House, Dublin, 1 vol. 4to., 1896. (N.B.—The above thirteen works were published at the author's expense.) Calendar of the Ancient Records of Dublin, in possession of the Municipal Corporation of that City, A.D. 1171 to 1730, 7 vols. 8vo., maps and illustrations, 1889-98; Leabhar Na H-Uidhre, Royal Irish Academy, Facsimiles Manuscripts, 1 vol. fol., 1870; Leabhar Breac, Royal Irish Academy, Facsimiles Irish Manuscripts, 1 vol. fol., 1876; Historic and Municipal Documents of Ireland, Master of the Rolls series, 1 vol. 8vo., 1870; Chartularies of St. Mary's Abbey, Dublin, Master of the Rolls series, 2 vols. 8vo., 1884; Register of the Abbey of St. Thomas, Dublin, Master of the Rolls series, 1 vol. 8vo., 1889; Facsimiles of National Manuscripts of Ireland, published by command of Her Majesty Queen Victoria, 5 vols. fol., 1874-84; Account of Facsimiles of National Manuscripts of Ireland, published by command of Her Majesty Queen Victoria, 1 vol. 8vo., 1884; Historical Manuscripts Commission Reports, 1870-98, viz.:—(1) Irish Corporations; (2) Marquis of Ormonde; (3) Trinity College, Dublin; (4) Lord Emly; (5) O'Conor Don, M.P.; (6) Duke of Leinster; (7) Marquis of Drogheda; (8) Earl of Fingall; (9) Marchioness of Waterford; (10) Dr. Lyons, M.P.; (11) R. T. Balfour, Esq.; (12) Earl of Charlemont; (13) Charles Halliday, Esq.; (14) Earl of Rosse; (15) Earl of Leicester, Rinuccini Manuscripts at Holkham, Norfolk; (16) Irish Franciscan Manuscripts, Louvain and Rome; (17) Earl of Granard; (18) Lord Talbot de Malahide; (19) Richard Caulfield, LL.D.; (20) Viscount Gormanstown; (21) Manuscripts of the Irish Jesuit Fathers; (22) General Dunne; (23) Sees of Dublin and Ossory; (24) Sir R. O'Donnell, Bart.

In addition Sir J. T. Gilbert was a contributor to various periodicals, and to the transactions of archæological societies.

ARCHITECTURE IN NEW ZEALAND.

AFTER an absence of two and a half years in New Zealand Mr. R. Mackay Fripp, F.R.I.B.A., has returned to Victoria, British Columbia. He has given the following description of architectural conditions in the colony he left:—I went to Auckland about two and a half years ago and found building in a very extraordinary condition, particularly in the direction of domestic work, which is extremely expensive and entirely without interest from an architectural point of view. Nearly all buildings are covered with mean little hip and valley roofs of galvanised iron which gives a very abject appearance to the town. The detail is entirely "stock" manufactured by the mills. Front doors are of a few stereotyped patterns. Inside doors, windows, skirtings and architraves, even verandah posts and mantel-pieces, are all repeated hundreds and thousands of times; shingles applied to walls and gable ends and the thousand and one uses to which they are turned in this country are (or until I showed them how they might be used) practically unknown. Shingles split and uncoloured are used for roofs, and soon turn black and twist, but galvanised iron is fast driving them out. The method of framing is much the same as in Canada, but timber being very costly, as much as 30 dols. per mille for plain sawn stuff, it is used with greatest economy,

there being no such thing as shiplap beneath the weather boards and finished floors, which are laid direct on the stud and joist respectively. Partitions and inside surfaces of walls are lined with rough boards 8 to 10 inches by ¼, ⅝ and ½ inch; though all sold as half inch in thickness, it varies tremendously. Scrim, a very coarse open-webbed material like sacking, is stretched, taped and tacked before the skirtings, architraves or wooden cornices are fixed. On the scrim, wallpapers, for the most part very commonplace in character, are laid. The ceilings are mostly composed of ½-inch by 12-inch boards with a moulded batten (mill stock, of course) nailed over the joints, and these flimsy, ugly mushrooms cost about twice as much as a well designed and carefully detailed house costs here. The labour is slow, the methods antiquated, and the architects being not quite but almost entirely drawn from the ranks of the builders, not frequently the architect cares nothing about his work beyond the interesting fact that a commission more or less reduced to meet the demands of his employer is attached to the "job." Such a state of affairs is hopeless, so much so that though a man of some ability occasionally finds himself in New Zealand, he almost invariably soon leaves in disgust.

During my sojourn in Auckland I imported fine red roofing tiles made on a French system in Sydney. I also obtained a few thousand bunches of redwood shingles, and advertised for and found a couple of men who knew how to cut a shingled arch, lap a hip or an angle, and dip the shingles before laying. By refusing to use any stock door, sash, moulding or turning, and by designing everything myself, and seeing it made too in many cases, I succeeded in breaking through the stereotyped style of work, though not without some fierce opposition on the part of the builders, and less open but not less bitter resentment of many of the architects.

To give you some idea of the very great difficulty I experienced in getting work executed in New Zealand, I may mention that I made twenty-four sheets of detail drawings for a house that would not cost more than 5,000 dols. here. Now that the ice is broken, so to speak, I hope and believe that the younger architects will keep the fight going and gradually improve matters.

THE BOADICEA STATUE.

THE London County Council having by its General Powers Bill of this year obtained power "to erect and maintain or contribute towards the provision, erection and maintenance of works of art in London," will shortly proceed to erect upon the approved site, at the extreme end of the Victoria Embankment wall, by the corner of Westminster Bridge, the Boadicea statuary group by the late Mr. Thomas Thornycroft, which has been presented to the Council by Mr. J. I. Thornycroft. The highways committee having approved of the arrangements intend to ask for the sum of 1,100*l.* to cover the cost of placing the group in position and the expense already incurred in putting up and removing the temporary platform upon which a plaster cast of the group was recently exhibited. Mr. T. G. Jackson, R.A., who has been in communication with the Council's architect on the matter, has submitted a sketch, which has been approved by the highways committee, of a pedestal for the group. The height of the base of the group is shown upon this sketch to be about 11 feet 2 inches above the top of the Embankment steps—that is, 5 feet higher than the temporary platform for the plaster model. A joint report from the Council's engineer and architect suggests that the inner portion of the pedestal should be constructed of brickwork, and the upper part faced with Portland stone and the lower part with granite, as this mode of construction would be less expensive than the use of granite throughout; and that the cover of the pedestal upon which the group will stand should be bronze. The estimated cost of this mode of construction, which the highways committee adopt, will be 1,000*l.*

THE LATE THOMAS FULLER.

THE late Thomas Fuller, formerly chief architect of the Public Works Department of Canada, the intelligence of whose death at Ottawa last month was received, says the *Canadian Architect*, with widespread regret, was born in Bath, England, March 8, 1823, and was educated in Bath and London. His first large work (when only twenty-two) was the cathedral at Antigua, West Indies, the erection of which he superintended. He came to Canada in 1857 and commenced practice in Toronto with Chillion Jones of that city. In 1859 designs for the parliament buildings, departmental buildings and Governor-General's residence were invited by public advertisement. His designs were awarded for the parliament buildings first premium and for the departmental buildings and Governor-General's residence second premium. On December 2, 1859, he was appointed architect for the parliament buildings, and the work under his supervision was formally commenced on December 20, 1859.

In 1862 a Royal Commission was appointed to report on all the Government buildings then in course of erection at Ottawa. In 1863, it having been decided to proceed with the works, new contracts were made with the former contractors, and Thomas Fuller and Charles Baillarge were appointed joint architects for all the buildings. In May 1865 the services of Mr. Baillarge were dispensed with, and from that period until 1867 the whole duties devolved on Mr. Fuller, when the buildings were completed, with the exception that the completion of the library and upper part of the main tower remained in abeyance for four years, and were then carried out by the officers of the department in accordance with Mr. Fuller's original designs.

In 1867 he entered into a competition for the State capitol at Albany, New York State, and was awarded first premium. In a second competition he associated himself with Mr. Augustus Laver and prepared a joint design, which was accepted.

Their design for the city hall, San Francisco, Cal., was awarded first premium, and being accepted, Mr. Laver then left to take charge of the work, Mr. Fuller remaining at Albany until a change of politics brought a change of architects.

In 1881 he was asked to return to Ottawa to accept the position of chief architect of the Dominion Government. Having accepted this position, he remained in charge until he was superannuated in 1897. During his term of office there were erected from his designs 140 public buildings, which include six drill halls, the Langevin block in Wellington Street, the printing bureau, all the experimental farm buildings, and many other prominent buildings.

He was elected a Royal Canadian Academician by Lord Lorne, and his original design for the parliament buildings and Governor-General's residence are now in the National Art Gallery.

In 1853 he was married to a daughter of Mr. W. Green, J.P., of Bath, England, who survives him. Mr. Fuller also leaves three children, all of Ottawa:—Mrs. Greene, wife of Mr. George M. Greene, barrister; Mr. T. W. Fuller, architect, Department of Public Works; and Mrs. Moore, wife of Mr. W. H. C. Moore.

TRURO CATHEDRAL.

THE annual conference of the diocese of Truro was opened at Truro on the 27th ult. The diocesan cathedral committee reported that they had requested Mr. F. L. Pearson to act as architect of the work to be carried out in accordance with his father's designs for the completion of Truro Cathedral, and he was preparing working drawings of the whole of the nave. When the drawings were completed tenders would be asked for. After paying 1,983*l.* for the cost of foundations there was a sum of 26,673*l.* available for the continuance of the work. The Earl of Mount-Edgcumbe said the lowest estimate of the cost of the nave was 40,000*l.*, and they had the alternatives of attempting to begin the work with a deficit of 15,000*l.* or 20,000*l.*, of reducing the character of the work, or of waiting until more money came in. The Bishop moved a resolution encouraging the building committee to proceed with the work next spring, on the understanding that the sum of 8,000*l.*, in addition to the 27,000*l.* already subscribed, would be sufficient to build the nave. Colonel Tremayne said the interest felt in the county in the cathedral was not waning, but he thought it was waning outside. This was the more to be regretted because the nave would be the memorial to Dr. Benson, the late Archbishop of Canterbury. The resolution was carried.

GLASGOW INSTITUTE OF ARCHITECTS.

THE newly-elected Council of this Institute held their first meeting on the 27th ult. in the office of Messrs. MacLean, Fyfe & MacLean, 115 St. Vincent Street, when the following office-bearers were elected, viz.:—President, Mr. David Barclay; vice-president, Mr. Alexander Petrie; auditor, Mr. W. Forrest Salmon; secretary and treasurer, Mr. C. J. MacLean, writer, 115 St. Vincent Street. The various committees for the year were appointed, including a committee on architectural education and on public architecture and competitions. A special committee was appointed to consider the subject of general conditions of contract, including certain grievances brought forward by the Building Trades Exchange. The Council agreed to hold a special meeting on the 3rd inst. to consider recommendations for the Fellowship of the Royal Institute in terms of the supplemental charter of that body.

The second ordinary meeting of the Liverpool Architectural Society will be held at the New Law Library, 41 Castle Street, on Monday next, November 7, at 6 P.M.

NOTES AND COMMENTS.

It is a common remark of late years that the seasons have changed in England, and not many years ago the atmospheric disturbance which startled Camberwell on Saturday would be considered as a special visitation for the punishment of some inhabitants. Apparently there is a like experience in Canada of departures from the old-fashioned meteorological arrangements. From the last number of the *Canadian Architect* we learn that marked changes are taking place, particularly in the North-West and Ontario. As a rule the winters are shorter and less severe than a quarter of a century ago. In the North-West the much-dreaded early frost has to a large extent disappeared. These favourable changes are no doubt rightly attributed to the cutting-down of the forests and the increased area of land under cultivation. Climatic changes of a less agreeable and beneficial character have likewise been induced. Prominent among these are lessened rainfall and increased wind pressure, developing on occasion into hurricanes and cyclones, like to that which last month devastated a portion of the town of Merritton. It is to be hoped that wind storms approaching in velocity the one referred to are not likely to occur at frequent intervals in the future as the result of changed climatic conditions. At all events it would seem that increased wind pressures are likely to characterise the climate of this country in the future. Architects would do well, therefore, to take this new factor into account in the designing of their buildings, and exercise greater care than hitherto in the design and construction of roofs and projections, such as chimneys, towers and spires.

A very large sum of money was expended by the late Sir Benjamin Lee Guinness on the restoration of St. Patrick's Cathedral, Dublin. It is now apparent that in parts signs of decay are again apparent, especially on the exterior of the eastern chapels, which were restored in 1846 by Dean Pakenham under the direction of an eminent architect of that day. According to Mr. Thomas Drew, R.H.A., dilapidations had not in 1864, eighteen years afterwards, when the greater restoration was effected, reached such a stage of decay as to demand attention. Portions of the old stone used in 1255, a remarkable Somersetshire oolite, are in sound condition. The soft Caen stone, unfortunately employed in the restoration in 1846, is now everywhere perishing. Its disappearance, of course, must affect the stability of the great buttresses, but does not affect the safety of the chapels themselves, the beautiful interiors of which are in no danger. The exterior of the other cathedral in Dublin (Christ Church) also unfortunately demands a like reparation from like cause. The Caen stone mistakenly used at Christ Church in 1874 in restoration and replacement of the ancient stone—also the Waterbourne stone from Somerset—is in advanced stage of dilapidation. No care on the part of conservators could have stayed this inevitable decay. In every other respect, Mr. Drew says, the maintenance of the fabrics of the two historic cathedrals by their respective boards and benefactors has been thorough and vigilant.

Wooden conduits for water supply are in this country considered to be relics of an age that was not advanced. In some of the towns of the United States there is a desire to employ them in preference to metal pipes. A couple of weeks ago it was explained before the American Society of Civil Engineers that stave pipes could be made and set in concrete for 10 dols. per foot length, while cast-iron cost 19 dols. One member said he had seen in California wooden pipes as good as new after thirty years' service. He considered they required to be continually saturated and would certainly decay if painted inside. The pipes should be hooped with elliptical iron, because that offers less surface for corrosion, and the hoops should be manufactured and applied with great care. In New York wooden pipes were found which had been in the earth for a century, and they were perfectly sound. According to another member, the pipes are objectionable on account of the growth of grass roots between the staves, and from the distortion which diminishes the sectional area. A 30-inch circular pipe is an ellipse with a vertical axis of 26 inches and horizontal axis of 34 inches. The general conclusion was in favour of wooden pipes. This is the more remarkable because Americans are supposed to turn out iron and steel pipes at rates which are surprisingly low.

On Wednesday a meeting was held in Peterborough in support of the Cathedral Restoration Fund. According to the dean's statement the work commenced in 1883, and up to 1894 the sum of 32,464*l.* was raised for the fabric itself. The great storm of March compelled them to resume operations, and since that time a further sum of 9,357*l.* had been raised. They were now engaged in completing the restoration of the west front and other parts of the fabric, to complete the whole of which about another 10,000*l.* would be required. The Bishop of London said it had been his lot to live near great buildings in Carlisle, Durham, Oxford, Cambridge and Worcester. And in all these cases he found, on looking back upon his experience, that those buildings had the strongest and most powerful influence upon him. About no building did he feel more strongly than Peterborough Cathedral. There was no building that had more influenced the constructive ideas of his life than had the associations that were connected with that place. He was very thankful to think that the greater part of the money which had been raised for the restoration had been expended underground, and that the building itself had not been altered in any way whatever. Its old features had never been tampered with, and none of them had disappeared; the building had simply been put into substantial repair and been protected against the ravages which partly time and the works of man had threatened to work in the security of its tenure. The Bishop pointed out the disastrous effects which the modern drainage of the district had had upon the building, causing the foundations to give way and necessitating the many works of restoration. Considering how much had already been done it was a comparatively small sum that was required to really finish the work and to leave the whole structure absolutely secure. Peterborough came into existence round its cathedral, and though it had become a busy place, still the greatest glory was its ancient cathedral, which was also dear to the whole diocese because of its greatness, its dignity and its importance. Mr. Bodley, A.R.A., finally gave his testimony about the admirable manner in which the work of restoration was carried out.

"Business premises" are in several towns becoming of more importance than the municipal buildings. When, for example, the designs for the City Hall, Belfast, were seen, the inhabitants of the Ulster capital considered they were too grandiose. What did they want with big domes and lofty towers? There is now some alarm that, owing to the character of the new buildings near it, the City Hall will not be sufficiently expressive of the importance of the Council who deliberate within it. There will be four towers at the angles, each 100 feet high, and a dome, of which the summit will be 150 feet from the ground; but the average height of the block is 56 feet. Immediately in front will be, however, an "emporium" of an average height of 85 feet, with a tower of 150 feet. An insurance office is also to be erected, with a height of 82 feet and a tower of 140 feet. It may also be assumed that efforts will be made to have larger and higher buildings, which will symbolise the commercial importance of Belfast.

ILLUSTRATIONS.

CATHEDRAL SERIES.—ST. ALBANS: WEST FRONT.

THE BRITISH LINEN BANK, EDINBURGH.

PROPOSED METHODIST CHURCH, WESTON-SUPER-MARE.

THIS design was submitted in a recent limited competition. The plan embodied narrow aisles for use as passages only, thus obtaining the æsthetic effect of arcades without any obstruction to sight. The more ordinary type of Nonconformist chapel, with galleries and cast-iron columns, was, however, preferred by the trustees. The design is by Mr. H. Dare Bryan, architect, Bristol.

DESIGN FOR MUNICIPAL BUILDINGS, OXFORD.

THIS design was exhibited in the Royal Academy for 1898, the author being Mr. G. W. Webb, F.R.I.B.A., Market Place Chambers, Reading.

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last at 9 Conduit Street, W., the president, Mr. G. H. Fellowes Prynne, in the chair.

A vote of thanks was unanimously passed to Mr. Arthur Cates for his presents of office fittings, books, &c., and to all those who had in any way assisted to make the annual conversazione such a success.

The following were elected members of the Association:—Messrs. David Good, A. R. Brown, E. A. Agutter, Leonard Judge, P. J. Turner, F. G. Allsopp, T. B. Bull, H. R. Bird, E. D. Ford, H. J. Gravenor, R. Knott, J. Mansell, H. J. C. Marshall, E. J. Martin, G. J. Morriss, C. P. Moss, J. Myers, S. V. North, W. Paice, jun, A. G. A. Quibell, R. M. Reeves, F. V. Rider, W. H. Rogers, G. L. T. Sharp, G. S. Simpson, M. Skinner, C. F. Skipper, W. Thornton, J. E. Tindall, H. M. Whiddington, C. S. Yates, C. E. Simmons, C. H. Smith, A. Durst and E. Brantwood-Muff.

Mr. John E. Newberry, A.R.I.B.A., read a paper on

Excavations at Thebes.

When the committee of the Architectural Association asked me to read a paper on "Excavations at Thebes" I accepted without much thought of the great range that such a generalised title might be taken to embrace, for the site of ancient Thebes is the place of all others in Egypt where digging for antiquities has been carried on from the earliest times. Professor Petrie remarks that what we now find are but the last leavings of a hundred generations of incessant pillage. But this paper will only deal with the excavations that I personally assisted in making during two seasons' work for the Egypt Exploration Fund, and by the kindness of the committee of that Society I am able to show you a series of lantern slides from photographs taken whilst we were unearthing the Temple of Hatshepsut, now known as Deir-el-Bahari, or the Convent of the North. The result of this excavation, to quote an article in the *Edinburgh Review*, "has been to give back to the world a temple which, though ruined in some parts, unfinished in others, is, perhaps, the most beautiful, certainly the most original in Egypt, and the earliest of those now standing on the plain of Thebes."

I propose to divide my paper somewhat as follows:—

First, a description of the site and surroundings of our work, with a few slides in illustration. Second, a brief sketch of the vicissitudes that this temple has passed through, which, to be intelligible, must include a recital of a few of the facts of ancient Egyptian history.

Then I will endeavour to describe our mode of work, the architecture of the building and its details, and finally will show you photographs of a few of the antiquities that have been discovered there.

The site of the ancient city of Thebes in Upper Egypt is now marked by Arab villages, the principal being Luxor, Karnak, and Gournah, some 450 miles from Cairo by the river. When I returned from there in 1894, the railway alongside the Nile from Cairo only extended to Sohag, but now it passes through Luxor and Assuan, on the way to Khartoum.

But no one should attempt a first visit by train if he can possibly afford the time and extra expense of going by steamboat or better still by dahabiyeh. The *Edinburgh Review*, in the article which I have already quoted from, aptly remarks that "One cannot journey into the past of some four thousand years ago in thirteen hours of noise and dust. Five days on the Nile post-boat give a more fitting preparation, with their uninterrupted hours on a glassy water, through a landscape monotonous enough, but with a strange incomprehensible fascination of its own."

To continue the quotation in the writer's own poetic words:—"As one goes further south, the colouring becomes more vivid; the hills are no longer tinted with pale pink and purple, but glow at evening with the colour and transparency of a sunset cloud, or like snow peaks with their rose light and aerial blue shadows. At last, where the hills, no longer flat-topped, but with sharp peaks and jagged outline, open out round a fertile plain deep in corn, one comes to Luxor. It is sunset when one arrives by the post-boat; the sky glows behind the Libyan hills, the water towards the west is a sheet of gold and crimson, the pylons and obelisks of Karnak rise black on the left. Under the hills on the west bank one can faintly trace the white terraces and colonnades of Deir-el-Bahari; the Colossi are no more than two misty points against the hill; the giant pillars of Luxor stand out against the purple sky where night rushes up from the east; and Thebes is reached."

To give a clear conception of the position of our work and its relation to the surroundings, I have here a map of a part of the Theban district taken from Lepsius's Denkmäler." It will be seen that on each side of the Nile stretches a belt of fertile land; it is much wider on the east side, extending for perhaps 4 miles from the river to the mountainous desert of the Arabian hills beyond. Here by the river are the remains of the mighty temples of Karnak and Luxor, created for the worship of Amon, and the work of many generations. On this side stood the ancient city of Thebes. It will be seen that the map shows the cultivated land on the west side to be only a narrow strip, which ends as abruptly at the foot of the barren limestone cliffs as a lawn adjoining the gravel walk in a garden. Egyptian tombs were always placed in the desert, partly that they might be beyond the reach of the Nile and partly because every inch of cultivated ground was and is so valuable. The hills here are regularly honeycombed with tombs, and this western side is simply one vast necropolis, the biggest in the world. The northernmost cliffs, known as the "Drah abu'l Neggah," contain the earliest tombs. To the south-west is the entrance, a narrow gorge, to the natural amphitheatre of cliffs in which the temple of Deir-el-Bahari is situated. Beyond in the desert is the wonderful valley of the Tombs of the Kings, approached either by a ravine north of the Drah abu'l Neggah or by a steep mountain path over the cliffs. On this side of the river are also the Ramesseum, the temples of Seti I., Medinet Habu, Der el Medineh, as well as the famous Colossi. Lepsius believes that the temple of Deir-el-Bahari was formerly connected with Karnak, since the axis of the prolonged dromos would lead straight to the great Temple of Amon. The remains of the Sphinx Avenue, from Karnak to Luxor, can be traced, and in places the ram-headed monsters are still to be seen.

The ancient Egyptian name of the city is read as Uas and its scriptural name was No or No Amon, the city of Amon; no satisfactory explanation has been given as to why the Greeks called it Thebes, a name borne by cities in Bœotia, Attica, Thessaly, Cilicia, Asia Minor, &c.

It will be convenient here to briefly remind my audience that Egyptian history is divided into dynasties:—These are grouped into the Ancient kingdom, including the first to sixth dynasties, the Middle kingdom, twelfth to sixteenth, and the New empire, seventeenth to twentieth, which is dated at 1600 B.C. to 950 B.C. Following this is the period of foreign domination, twenty-first to twenty-fifth., or 950 B.C. to 663 B.C.; the late Egyptian period, twenty-sixth to thirtieth, or 663 B.C. to 332 B.C.; and the Græco-Roman time, which includes the Ptolemies, the Romans and the Byzantines, from 332 B.C. to 640 A.D.

The history of Thebes under the Early empire is veiled in uncertainty, but it is known to have been the capital of a nome or province, and was ruled by princes of its own. A sixth dynasty tomb has lately been discovered in the Drah abu'l Neggah by my brother, Mr. Percy Newberry. In the Middle kingdom, Thebes rose to a more commanding position; but its greatness dates only from the beginning of the New Empire, or, say, 1600 B.C. The liberation of the country from the Hyksos and the reunion of the kingdoms of Upper and Lower Egypt was directed from Thebes, and for centuries it continued to be the favourite seat of the Pharaohs. Historically the interest of Thebes centres on one of the most fascinating periods of Egyptian history—the eighteenth and nineteenth dynasties, being the time of the Amenhoteps, Hatasu, or, more correctly, Hatshepsut, the Thothmes, Seti, the Rameses, and Merenptah, of Israelitish fame.

But the sun of Thebes began to set when the royal residence was transferred to Lower Egypt in the twenty-first dynasty. Alexander the Great and the Ptolemies probably found Thebes still a great though decadent city, but they assisted to embellish it, as some buildings of this period attest. After many rebellions the great city revolted for the last time in 30–29 B.C., taking part in the insurrection of Upper Egypt against the oppressive taxation of the Romans. Cornelius Gallus, the prefect, overthrew the rebels, and is said to have utterly destroyed the ancient town.

From this time Thebes is only mentioned as a goal for inquisitive travellers, who, under the Roman emperors, were attracted to the Nile by two monuments in particular, the Pyramids and the musical Colossus of Memnon. The introduction of Christianity and the edicts of Theodosius were followed by the destruction of many pagan statues and the obliteration of countless inscriptions. Later the rock-cut tombs, at first occupied by Christian hermits, were converted into peasants' dwellings; Christian churches were erected in the temple halls and mud-brick houses built between the columns of the Temple of Luxor. Carefully worked blocks and slabs were removed from the monuments, which were used as quarries, and much beautifully carved limestone has been burnt for making lime.

In considering the history of the Temple of Deir-el-Bahari we must first glance at what we know of the reign of its great founder, Queen Hatasu, or Hatshepsut. In the first excavation of the temple it was not at once discovered that she was its founder, as in nearly all the inscriptions the name of her successor, Thothmes III., has been substituted for that of hers. But further observation has shown that, although she is always depicted on the reliefs in male attire, the personal pronouns in the inscriptions are feminine, and the names of the king were

incised deeper than the surrounding hieroglyphic signs. Such usurpation is not uncommon among the Egyptian kings, but the persistence with which every trace of the queen's reign has been erased seems to point to something more than the mere desire for fame. This destruction is attributed to the queen's nephew, Thothmes III., and the reason may be found in the history of the succession. Professor Petrie in his "History of Egypt" says that the father of Hatshepsut, Thothmes I., died before he had a son old enough to succeed him on the throne. Some five or six months before his death, and whilst he was probably in failing health, he associated his daughter with him, as she was the heiress in the female line, in which royal descent was specially traced. She was then about twenty-four years of age, and of great capacity and power. Two or three months later the king married her to his eldest son, Thothmes II., who would otherwise have had no claim to the throne, being the son of Mutnefert, who was not a royal princess. Ten weeks later Thothmes I. died. His son, who was now king in name, was but seventeen years old, appears to have shown no abilities, and must have been a weakling; for he did not go on any campaigns, undertooks no wars, in fact, did no great work of any kind, and at thirty he died. During his life his sister probably entirely organised public business, and at his death she was left sole legitimate ruler at about thirty-seven years of age; the only person who could challenge her power being her little nephew, Thothmes III., then, perhaps, nine years old. He had no claim to the throne, being the son of a woman named Isis or Aset, who was not of royal blood. But Professor Petrie considers that his aunt did all she reasonably could be expected to, for she associated him with her in the kingdom, public dating of documents was carried on in his name, and she married him to her second daughter Meryt-ra as soon as might be, and thus gave him the position of heir. If she held on firmly to her royal prerogative, she only did what any other capable ruler would have done.

No doubt it was galling to a very active and ambitious young man to be held down to peaceful pomp and routine. But, to quote Professor Petrie again, all things come to him who waits. Egypt developed greatly during this twenty years of peace and progress, and at the queen's death, Thothmes III., now thirty-one years old, succeeded to the full power. He was then able to launch into that mighty series of campaigns which mark the highest extent of Egyptian power and which gloriously occupied twenty-eight years of overflowing energy.

We can now form some idea of the force of character and ability of Queen Hatshepsut by the fact that she is, as far as we know, the only woman in the great historical period that overcame the prejudices of a changeless people and broke the male line of succession. By one means or another she kept her throne, and only after many years could her mighty nephew wreak his vengeance on her monuments.

But Hatshepsut's temple suffered at other hands than Thothmes III. Amenophis IV., Khuenaten, or, as the name is now read, Akhenaten, the so-called heretic king, hacked out here, as everywhere, the figures and names of Amon-Ra, and the inscriptions and reliefs were left thus mutilated until the time of Rameses II., who restored them, though in a style unworthy of the first hand. For centuries after the temple remained practically unaltered, though there are evidences that the unfinished northern colonnade was used by a colony of embalmers as early as the twenty-second dynasty, and many burials have been discovered in this part of the twenty-sixth dynasty. Under Ptolemy Euergetes II. a few minor restorations and some important additions were made. On the introduction of Christianity a community of monks established themselves and founded a Coptic convent, known to the Arabs as Deir-el-Bahari, which was built with bricks brought from an edifice of the twenty-sixth dynasty at the Assasîf. The chambers of the temple were converted into chapels, and the "heathen" representations on the walls barbarously defaced.

The earliest detailed description of the place is given in the account of the French expedition of 1798, and later on we read of it in the works of Wilkinson, Lepsius and Mariette, the latter of whom undertook important excavations in 1858, and published a monograph on the temple.

But it was reserved for the Egypt Exploration Fund, under the able guidance of M. Naville, to bring to light one of the most interesting temples of Egypt, of which up to 1892 two-thirds were covered by mounds of rubbish that reached to a height of 40 feet in many places.

As I am addressing an architectural audience I cannot do better than begin my description of the temple with a ground plan. This only reaches as far east as the lower colonnade, the excavation of the lower part not having been commenced when the drawing was prepared.

The plan is very remarkable, quite different from all other temples in Egypt, and was probably suggested in great measure by the site.

It consists of three great terraces or platforms cut out of the east slope of the mountain, and rising one above the other from the level ground, the upper platform being backed against the vertical cliffs, which here rise to a height of 384 feet. Centrally placed sloping ways, or inclines, lead from terrace to terrace, and along the front of each terrace the ceiling stones of the one above were carried over on the top of a double colonnade, thus forming a kind of cloister underneath. The upper and part of the middle platforms are terminated by a series of chambers, excavated and then built into the solid rock.

The sphinx avenue, some 24 feet wide, with trees planted at intervals, led from the plain, or perhaps the river, to the gateway of the lower court, or entrance to the temple precincts, and formed a continuation of the axis of the temple, running approximately east and west. Only the scantiest traces remain, but these are enough to show that the gateway was flanked with great granite obelisks, which stood on pedestals. This first court, or lower platform, measures about 325 feet by 263 feet wide, and the excavations have proved that it was treated as the garden or orchard of the temple; round pits cut in the rock some 10 feet deep have been discovered full of Nile mud with the stumps of palm or apricot trees still in them. The western colonnades are in ruins, but we can see that they each consisted of twenty-two pillars, arranged in double rows. The back row were sixteen-sided, and the front row seven-sided at the back and square in front.

The top of the stone ceiling of this colonnade formed the floor of the court above, the middle platform, which is at a level of 21 feet higher up. It measures roughly 279 feet by 250 feet wide. On the west it is bounded by a double colonnade, each side consisting of eleven pairs of square pillars. Two steps at the north end of the colonnade descend to a hypostyle hall, in which are twelve sixteen-sided columns arranged in three rows, which support massive architraves and a flat stone ceiling. Three steps lead up to the shrine of Anubis, consisting of three small chambers with elliptical vaulted ceilings. On the north side of the court is a colonnade of fifteen sixteen-sided columns, and in the wall behind are four small vaulted chambers. The south side of the middle platform is supported by a retaining wall ornamented with wide, flat pilasters, surmounted by alternating hawks and urasi of colossal size.

To the south-west of this court, and at the same level, is the little shrine dedicated to Hathor, goddess of the dead. It has since been found that this was reached only from below by a flight of steps, of which a few traces still remain. The innermost chambers are hewn out of the rock, and are preceded by two covered vestibules, which are now in ruins. The first had sixteen-sided columns and four square pillars, with semicircular attached shafts, terminating in Hathor-headed capitals, the remains of which are now lying shattered on the ground. The second vestibule, at a slightly higher level, has four central columns, with round shafts and sixteen-sided columns on either side. The shrine proper is raised two steps, and consists of three chambers, each with several niches surrounding it.

Here we find conformity with the same law which prevails in hypæthral temples, and which M. Perrot has named "the law of decreasing dimensions." Thus from portico to sanctuary the dimensions of the building decrease in every way and the floor itself rises. The innermost room contained the sacred emblem of the goddess, perhaps a golden cow enclosed in a tabernacle or shrine. The sacred boat which bore the tabernacle was probably kept in the room immediately preceding. The various lateral niches were used, it is supposed, as store chambers, to serve for offerings, the divine vestments and all the sacred furniture.

We now ascend to the level of the upper platform, which is again 21 feet higher up. The terrace in front of the central court had a row each of square pillars and sixteen-sided columns, as remains show on the north side. A granite doorway leads to this central court, 83 feet by 121 feet wide, which it is now considered had a double row of columns around it. The ruins of the porch to the sanctuary are of Ptolemaic date, and lead to a hall with semicircular vaulted roof and two chambers beyond; the westernmost chamber is a restoration by Euergetes II., in which the reliefs and inscriptions compare very unfavourably with the masterly sculptures of Queen Hatshepsut. The western wall of this central court is built against the steep cliff of the mountain, and pierced with a series of niches. In the northern wall is a doorway leading to a vestibule which had three sixteen-sided columns in it. Opposite the door is a small niche, the upper part and ceiling of which had been displaced by falls from the cliffs above, and which I have rebuilt. To the west of the vestibule is an open court, in which is found the only altar that has come down to us from Egyptian antiquity. A door in the north wall of this court admits to the funerary chapel of Thothmes I., consisting of two chambers built into the cliff. The Hall of Amon, to the west, is approached only from the upper court, and part of its flat ceiling still remains in position.

On the south side of the central court are several chambers, now in ruins, and a well-preserved sacrificial hall with a portion of the semicircular vaulted roof still standing. This part of

the temple was not completely cleared until the season after I left, and I am unable to describe it completely.

All the excavations in Egypt are regulated by the Governmental Department of Antiquities. The permit granted to M. Naville on behalf of the Egyptian Exploration Fund, I believe, stipulated that the Society should undertake to completely uncover the whole temple, and also do any building work that might be necessary for maintaining or re-erecting the old walls.

This is not the usual method in which private excavations are carried on in Egypt. A series of trenches is often all that is required to explore an ancient site and discover all the antiquities that may be buried upon it. But in our case it was necessary to remove the rubbish and dust, accumulations of centuries, to a considerable distance from the temple ; and it was also found that when the support of the surrounding earth was taken away from some of the walls that they required strengthening.

Owing to the kindness of M. de Morgan, the then director of the Department of Antiquities, we had all facilities granted us for carrying on the work ; and he placed at M. Naville's disposal a quantity of Decauville trucks and quite half a mile of tram lines, with all the necessary curves and points for making a complete railway.

The general view of the temple taken before our excavations will show that the mounds rose very considerably towards the west ; it was, therefore, necessary to arrange a system of tram lines on three different levels, each of them having only a slight gradient, and some 20 feet above one another. The rubbish was taken in trucks from the highest mounds and tipped on to the next level ; from thence it was loaded up again and tipped down to a lower level, where another system of trucks carried it some quarter of a mile away from the temple to a natural hollow called by the Arabs "birket," or lake. During the two seasons that I was in Thebes a matter of 6,000 cubic metres of rubbish and stones were thus carried away from the temple, a feat that would have been impossible without the aid of a tramway.

This arrangement, necessitating the loading up of our trucks three times over, was criticised by some of the visitors that came to the temple, but I do not see how it could have been much improved upon. A steeper gradient would have been dangerous with such workmen as we had to deal with, who, in spite of all warnings, would push their trucks too fast and thus run them off the rails, damaging themselves and our rolling stock at the same time.

Here at Deir-el-Bahari the diggers, drawn from Theban villages, have many of them been tomb-robbers from their infancy, and consequently have lynx eyes for small antiquities. The actual digging is done by men with an implement like a short hoe or adze, called a "tooriyeh," with which they scoop the dust and rubbish into their palm-leaf baskets. Boys then carry these baskets to the trucks, which are drawn up close by, and bring them back to be filled again. Three or four men were in charge of each truck and pointsmen were stationed at various places. These latter posts were a good deal sought after, as the man in charge had only to push or pull the rail with a hooked stick. He could thus pass his whole day seated and smoking. We employed on an average 250 men and boys a day, with eight reises or overseers, one head reis to manage the railway—a clever Pyramid Arab—and a Coptic scribe who entered the names each morning and kept the account. The wages were for a day lasting from sunrise to sunset—boys, 1½ piastres (3¾*d.*) per day ; men, 2 piastres (5*d.*); and 3 piastres (7½*d.*) for the reises. Occasionally the order was given to search each man before he left the works, as a preventive against their stealing small antiquities, but we did not succeed in finding anything concealed upon them.

Another general view of the temple, taken after our excavations in 1895, shows the magnitude of the work and the degree of success that has been attained.

It may be interesting to note here that the great tomb cave in which the celebrated find of royal mummies was made is always spoken of as being at Deir-el-Bahari, but it is nearly half a mile to the south, between the hills of Sheikh Abd-el-Gournah and the cliffs of the Libyan mountains. In the twenty-first dynasty, during a time of political trouble, it was resolved to protect the royal mummies from the chance of robbery by interring them altogether in this tomb cave. Corpses of the ruling dynasty were also placed here and all left in peace until 1875, when some Arabs discovered the well-hidden resting-place. The fellaheen kept their secret until 1881, when they were traced, and Brugsch Bey had all the mummies conveyed to Gizeh. A few yards north of the court is a square well-shaft forming the entrance to the common tomb of Theban priests of the seventeenth to the twentieth dynasties, which yielded a rich treasure to the Gizeh Museum in 1891.

During our first season M. Naville and myself lived in an Arab house in the village of Gournah, a good mile from the temple. This was found to be very inconvenient, and as the work was estimated to take several years for its accomplishment, the Egypt Exploration Fund decided to build a house quite close to the temple, which should be the headquarters of the staff. I accordingly designed a building which had a central courtyard with a dining-room overlooking the temple, five bedrooms, two storerooms, kitchen and bathroom arranged around it. The foundations were of rubble stone laid in Nile mud mortar, the walls of mud brick, some of them being brought from the monastic buildings that we had to pull down to clear the temple. These in their turn had been pilfered from a twenty-fifth dynasty building some 500 yards away. We found a few of them bearing the name-stamp of an officer of the twenty-fifth dynasty, known from an inscription at Karnak as "the fourth prophet of Amon, the Prince of Thebes, the Governor of the South, Mentuemhat." The bricks measured 12 inches by 6 inches by 4½ inches thick, and probably only one in every hundred or thousand was stamped. The roofs were flat and ceiled with rafters and boarding on which was laid a layer of mud bricks on chopped straw, and the whole plastered over with mud mortar. The walls were roughly plastered inside with a mixture of lime, sand and chopped straw, the lime having been burned in a native kiln, which I had made close by. The floors were of ancient red brick, floated over and set with a mixture of powdered burnt brick and lime. The joinery, with a few exceptions, was entirely of native make, the doors and windows being hung on wooden pivots, the former being fastened with beechwood locks and keys. As the house has been used every season since it was built in 1893 by members of the staff of the Egypt Exploration Fund, it has well justified its existence. The great work of copying all the reliefs which cover the temple walls is not yet finally completed, and Mr. Carter, the artist, has already taken up his abode at Deir-el-Bahari for another season's work.

In considering some of the details of the temple, we may begin with the lower terrace, on a part of which are a few stones depicting the transportation of two great granite obelisks. Various fragments belonging to this most interesting scene have been discovered in the Coptic buildings which had to be removed, and it is now possible to piece them together sufficiently to show that the obelisks were placed on a great, boat-like barge. This was towed by thirty large rowing-boats, arranged three abreast and in lines of ten. There were thirty-two oarsmen in each boat, so that, adding officers and steersmen, the crew which towed these obelisks from Assuan to Thebes numbered quite 1,000 men.

A diagram showing a partial restoration of this scene, drawn by Mme. Naville, appeared in the "Archæological Report of the Fund" in 1895-96.

Whether these obelisks were destined for Karnak, this temple or elsewhere I cannot say. One of Hatshepsut's obelisks at Karnak is still standing ; it weighs about 300 tons, and the inscriptions mention that these two monoliths were quarried and erected complete in seven months. Professor Petrie believes the pair at Deir-el-Bahari to have been put up by Thothmes III., and identifies the top of one of them at Constantinople. He calculates the weight of each obelisk at the enormous figure of 800 tons.

We now ascend to the middle platform and examine first the sculptures on the southern half of the terrace. The twenty-two square pillars which supported the ceiling are of a slightly tapering form with delicately-rounded arrises. The scenes on the walls commemorate an expedition to the Land of Punt, which is supposed to lie on the west coast of the Red Sea, corresponding with the modern Somali coast. Incense, panther skins, ivory and ebony were among its chief exports to Egypt. A village in Punt is shown, the houses of which are built on piles over water, amongst palms and incense trees, and ladders lead up to the doorways. We see the Egyptian fleet setting sail, and above, its arrival in Punt. Further on the queen, followed by her guardian spirit, dedicates to Amon the spoils of the expedition. Cattle are shown feeding beneath delightfully conventional trees. Gold and electrum is weighed and incense is measured in the presence of the gods.

On the corresponding northern half of the same terrace the scenes refer to the birth of the queen, but unfortunately in every case the figure of Hatshepsut has been defaced, though that of her mother Ahmes has been respected. Her admirable portrait is probably the finest piece of work remaining in the whole temple. Though, like all the sculpture, it is in very low relief, the admirable modelling of the delicate and refined features, and the smiling expression, give to the face a beauty which bears witness to the skill of the Egyptian artist, and makes one regret that so little has been left of the original work.

A great feature in this temple are the so-called proto-Doric columns. Those in the hypostyle hall are sixteen-sided, measuring 2 feet 7 inches in diameter just above their shallow circular bases, and they are 15 feet 9 inches in height, tapering to an upper diameter of 2 feet 4 inches. The abacus is square and flush with the shaft, and a simple band of hieroglyphics appears on one face. Prototypes of this form are to be found in

the rock-cut tombs of Beni Hasan, which differ only in having fifteen of their sides fluted like a Greek Doric column and one left flat to receive the dedication inscription.

This hypostyle hall, which forms a vestibule to the shrine of Anubis, is in a very perfect state; the flat stone ceiling, resting on massive architraves, and the supporting columns are all intact. The ceiling is painted blue and powdered with yellow stars. The spacing of the columns is wider in the centre, so as to form a better approach to the chambers beyond.

The granite doorway leading to the central court is one of the most striking features of the upper platform. It is specially interesting in that it shows clearly the erasures around the cartouches which bore the queens' names, "Ma-ka-ra, Hatshepsut," but which now read "Ra-men-Kheper, Tehutimes," the names of Thothmes III. Where these alterations occur one can see plainly that the surface of the granite has been rubbed down to admit of new signs being inscribed. But, irrespective of erasures, Egyptologists are able to prove that the queen's cartouches must have been there by the fact that the surrounding inscriptions are in the feminine gender. That great doors were once hung here is shown by the pivot and bolt holes on the inside.

A somewhat similar granite portal on the further side of the central court leads to the Sanctuary, a narrow hall with a semi-circular stone roof. These curved vaults occur in several parts of the building, and are not true arches, but built with horizontal joints, forming really a series of corbels curved on the inside. Nevertheless, it appears quite certain that the Egyptians understood the principle of the arch, and used it in brick buildings. The so-called granaries of Rameses, behind the Ramesseum, are notable instances of arched constructions of the nineteenth dynasty; but last season Professor Petrie unearthed a mastaba, or built tomb, at Denderah, with three ring brick arching to it, which belonged to a prince named Adu, who lived under Pepy II. of the sixth dynasty—at least 4,000 and perhaps 5,000 years ago.

The great stone altar which stands in the middle of the Altar Court is one of our most interesting finds. It is a rectangular structure of fine white limestone, measuring about 16 feet by 13 feet. At the western end is a flight of ten steps leading to its upper surface, 5 feet 2 inches above the floor. It is crowned with the usual bold cornice so common in Egyptian architecture, consisting of a large bead and cavetto moulding, and a similar bead to that on the cornice is worked on each angle of the altar mitreing with the cornice bead. The proportions of the steps leading up to the altar are worth mentioning, having a rise of 6·2 inches and a tread of 19·1 inches; but the treads are not level being "kilted," or inclined as much as 1·85 inch. The height of each riser is thus only 4·25 inches. The Altar Court was evidently always open to the air, and its walls are consequently uninscribed and quite plain. They are built to a batter, as are most walls in the temple, and were finished with an overhanging cornice. I carried out some considerable repairs here, consisting of rebuilding portions of walls and altar and forming rough retaining walls against the loose and friable cliffs on the north.

In the middle of the north wall of the Altar Court is the doorway leading to the funerary chapel of Thothmes I., a chamber at right angles to the court and measuring 17 feet 3 inches by 5 feet 2 inches wide, and roofed with a curved ceiling of elliptical form with horizontal joints. At the north end is a stone seat, and above it is a much mutilated scene. It represented on the left a shrine, in which stood the symbol of the god Anubis, a skin on a pole. Before the shrine stood the queen, now completely defaced, and behind her Thothmes I., her father, whose cartouche reads "Aa-kheper-ka-ra." In the upper part of the scene were two jackals, also emblems of Anubis, each couchant on a shrine. In the centre is the cartouche of the queen, "Ra-ma-ka," or "Ma-ka-ra," as it is now read. At the north end of the chapel and on the western side is a niche for the reception of offerings.

In the passage between the southern enclosure wall and the retaining wall of the middle platform, not far from the Hathor shrine, an inclined plane cut in the rock was discovered, leading to the entrance of a large tomb. The rubbish was here quite untouched, and when the doorway was cleared disclosed a large shaft well cut in the rock and opening into a larger chamber. In the middle was a square space for a stone sarcophagus, but instead of the surroundings of an important burial there was only a poor wooden coffin with bones in it, which seems to have been disturbed. No inscriptions or ornament of any kind were to be seen except a few hieratic signs. M. Naville thinks it probable that this tomb was prepared by Hatshepsut for herself, but was never used owing to the hatred of her nephew, Thothmes III.

In this same passage a large foundation deposit was discovered in a rock-cut pit, about 3 feet deep. It was covered with mats, under which lay first a few pots of common earthenware, then about fifty wooden objects, models of an implement which, for the want of a better name, have been called winnowers. M. Naville says that they may be sledges used for threshing corn. Each bears the cartouche of the queen. Lower down were fifty wooden hoes, four bronze plaques, a hatchet, a knife, eight wooden models of adzes, and eight larger adzes with bronze blades; at the bottom were ten little pots of alabaster and ten baskets, stands for the pots. All these objects were, as usual, buried in fine sand.

In every Egyptian temple the sanctuary contained a shrine or naos, in which were hidden the emblems of the god to whom the temple was dedicated. They were generally made of wood, so that they could be moved and either placed on sacred boats or carried by means of staves, as was the ark of the Israelites.

All the wooden shrines have perished, except a very small one, but a foot high, which is now in the Turin Museum. During our first season we found one side of a large ebony shrine, the panel measuring 5 feet 7 inches, 3 feet 7 inches wide and 1 inch thick; also one leaf of the doors of the shrine, which is 2 feet 5 inches high, 12½ inches wide and ⅞ inch thick.

On the inside of the shrine one can see the mortises and part of the adjoining panels. As ebony can only be obtained in small sizes, the whole is pieced together of little bits, and held by pegs of the same wood. The angles or styles are cut out of solid pieces, 2½ inches square, to which are framed the top and two middle rails of the same width as the angles, but only 1 inch thick, thus dividing the whole into three panels. The bas-reliefs represent Thothmes II. making offerings to Amon-ra, the erasures being probably owing to Akhenaten. Underneath are a series of magical signs, arranged in pairs, and the symbols of stability and duration. At the bottom is a range of the so-called false or "Ka" doors.

Externally the panel is divided into six divisions, two of the rails being only thin pieces of ebony pegged on, forming what we should term a sham. Rows of the same emblems are arranged in the panels, and the styles or rails are beautifully carved with dedicatory inscriptions of Thothmes II., part of which reads, "He made a sacred shrine of great value of ebony of the mountaineers (of Nubia)." On each side of the horizontal lines it is stated that Thothmes is a worshipper of Amon-ra, who dwells in "Serui," the ancient name of the temple.

The small leaf of the double door is also made of irregular-shaped pieces of ebony, dowelled together and having eleven small ledges pegged on to one side, each of them about ⅞ inch by ¾ inch and rounded on the back. The pivot side of the door is also rounded and the bolt side rebated for the other leaf. Four bronze staples for the bolts are still in position.

A description of this temple, however slight, would be incomplete without a reference to its celebrated architect, Senmut. It seems that though Hatshepsut, like Queen Elizabeth, was not beloved of her relations, yet she had the same power of drawing to herself great men. Of such a man, Senmut, the architect of her temple, we have many records. To quote the *Edinburgh Review*, "The many sidedness of Michel Angelo was nothing compared to that of Senmut—the queen's architect—who himself superintended the quarrying and carving of the queen's obelisks; was tutor to the queen's daughter Neferura; he was keeper of the Temple of Amon; keeper of the granaries of Amon; royal seal-bearer; keeper of the palace; keeper of the heart of the queen (to which title Petrie compares the keeper of the king's conscience or Lord Chancellor); priest of Aahmes; keeper of the queen's cattle." Besides his great work at Deir-el-Bahari, he directed the erection of Hatshepsut's two granite obelisks at Karnak and superintended architectural work at the temples of Karnak, Mut Luxor and Erment. A kneeling statue of him was discovered by Miss Benson in 1896 at her excavations at the Temple of Mut. The inscription states that it was "presented by favour of the queen," and some further interesting particulars of his life will shortly appear in her book on this temple.

My brother had the good fortune to discover his tomb high up on the north-east of the Gournah hills. It had been very magnificent, but the painted facing of the walls is now almost entirely destroyed.

A clear white glass bead, inscribed Senmut, was found at Deir-el-Bahari, as well as a fragment of a statue of him. My brother has a carefully-worked piece of black marble inscribed with his name, which appears to have been a paint muller, and may have been used by him for mixing up his Indian ink.

It is recorded that he was a man of the people, for "his ancestors were not found in writing," and his portrait-statue gives no very high-bred features, but an ugly, capable, complacent face.

In conclusion, I must acknowledge my indebtedness to the various publications of the Egypt Exploration Fund, by M. Naville, which I would refer you to for further information on this interesting and beautiful temple; also to Professor Flinders Petrie's "History of Egypt," and Professor Steindorf's edition of Baedeker's "Guide to Egypt," 1898.

Mr. R. PHENÉ SPIERS: I have been looking forward with considerable interest to Mr. Newberry's paper to-night, to see how far I should recognise old acquaintances. It is more than

thirty-two years since I stood on the site of the temple which Mr. Newberry has described, and were it not for the fact that I made many drawings there, which have from time to time refreshed my memory, my recollection of it would be more like a dream. The series of views of the excavations and of the remains now exposed have shown us that we owe a debt of gratitude to the Egyptian Exploration Fund, to M. Naville and to Mr. Newberry. At the same time I am not quite able to agree with Mr. Newberry that what he has shown us was "brought to light" by M. Naville, if by that remark he means the discovery of the remarkable plan of the temple. Mr. Newberry has quoted the several authorities who have published the results of their researches before M. Naville in 1893, but he has by inadvertence neglected to quote the one authority who more than any other revealed the actual arrangement of the temple. It is possible that between 1866 and 1893 many of the walls and columns exposed in the former year had been covered over again by the fleeting sand, but it is quite certain that many of them said to have been buried 20 feet or more were seen by me. The authority to whom I refer and whose name is not on Mr. Newberry's list, is M. Emanuel Brune, grand-prix of the Ecole des Beaux-Arts of Paris of 1863, who in 1866 made a complete survey of what was then to be discerned, and in 1867 sent in to the Institute of France his drawings of the plan as found, and a restored plan and perspective view which created quite a sensation at Paris, not only on account of the research displayed, but of the splendid drawings in which it was set forth. These drawings were seen by M. Mariette, who borrowed them for the purposes of publication, and published them in 1877; the plan of the buildings as found being put forward in the text as his own work, referring to the restoration drawings only as being M. Brune's. This plagiarism was not the only one practised by M. Mariette; in 1875 he had already published Brune's plan of Karnak as his own and without Brune's name attached to it, and it was not till 1877, when he published his work on Deir-el-Bahari, that he acknowledged he had reproduced M. Brune's plan. Fortunately, M. Brune's work was well known in Paris, and MM. Perrot and Chipiez, in their "History of Ancient Art: Egypt," published in 1882, note p. 425, say:—"The plan which forms plate 1 in the said work" (referring to Mariette's "Deir-el-Bahari") "was drawn in 1866 by the architect M. Brune, who is now a professor at the Ecole des Beaux-Arts. M. Brune succeeded, by intelligent and conscientious examination of the remains, in obtaining the materials for a restoration which gave us for the first time some idea of what this interesting monument must have been in the great days of Egypt."

In 1866 the north angle of the upper terrace was covered to the depth of 20 feet, and therefore the one important discovery made by M. Naville—viz. that of the great altar—was inaccessible. But M. Brune had not the assistance of a single spade. Mr. Newberry has informed us that 250 workmen have been employed for nearly two years. Naturally, therefore, some fresh discoveries might be expected, otherwise all the other architectural features are in Brune's plan, including the hypostyle hall—where, by the way, I worked for two days. Fortunately, I have in my possession two tracings which I made from M. Brune's sketches when we were imprisoned doing quarantine in the lazaretto of Syra in July of the same year, one taken from his sketch plan, the other from an imaginary restoration which he drew out in Thebes. In claiming for my old comrade of the atelier at Paris and travelling companion in the East (who died, I am sorry to say, ten years ago) the credit of having been the first to give some idea of the splendour of this temple, I do not wish to detract from the great services rendered by the Egypt Exploration Fund, M. Naville and Mr. Newberry, because they have uncovered and made known the bas-reliefs and sculptures which decorate this temple; and M. Naville's fame as an Egyptologist need not have been dimmed by the acknowledgment of the discovery of those architectural dispositions which were measured and drawn out by M. Brune. I have much pleasure in proposing a vote of thanks to Mr. Newberry for his most interesting paper and for the admirable illustrations with which it has been set forth to us, and I am sure we are all proud to learn that one of the members of this Association was entrusted with the task of working out the drawings, and, what is more important, taking all those precautions necessary to preserve the remains from still further ruin.

The vote of thanks to Mr. Newberry was seconded by Mr. Alex. Payne, and supported by Messrs. C. H. Brodie and Alexander Wood, M.A.

A vote of thanks was also passed by acclamation to the Egyptian Exploration Fund for the loan of diagrams, which were exposed on the walls during the lecture.

A Meeting of the Society for the Promotion of Hellenic Studies was held on Thursday, when the following papers were read:—"A Characteristic of Thucydides," by G. Beardoe Grundy; "A Vase with Death of Polyxena," by H. B. Walters.

INSTITUTION OF CIVIL ENGINEERS.

THE Institution of Civil Engineers held the first meeting of its eightieth session at its rooms in Great George Street on the 1st inst., when the new president, Mr. W. H. Preece, C.B., F.R.S., took the chair.

The President, in his inaugural address, expressed his gratitude for the honour done him, and said he was very proud not alone for the sake of that branch of the profession to which he specially belonged, but also because he was a member of the great Civil Service of this country. Twenty-eight of his forty-six years of professional work having been spent in the service of the Crown, he could speak with some authority and experience when he asserted that that service deserved a recognition for zeal, industry and the conscientious determination to do its duty far greater than that usually accorded it by Parliament, the public and the press. Since 1859 the members of the Institution had increased from 894 to 7,088, who were scattered over different parts of the world, over 70 per cent. being home members, over 20 per cent. colonial, and about 8 per cent. foreign members. It was not alone in numbers, however, that growth was shown. It was more so in the business of the engineer. The field of the profession had extended in all directions by the advances of practical science, and by a process of evolution and agglutination. The introduction of the steam-engine, the development of the railroad, the invention of the paddle and the screw, and the evolution of the ocean greyhound; the conversion of iron into steel and the demand for ores; the opening of coal and oil fields and the production of gas; the sanitation of our dwellings and our towns, and the demand for pure air and pure water; the applications of electricity and the annihilation of distance; the rifling of ordnance, the improvement of explosives and the armouring of great fighting, floating, moving machines; the enormous growth of manufactures and their distribution over the face of the earth; the pursuit of wealth, the roving propensities of our race and the industrial competition of nations—all these had contributed to break up the profession into special branches and into individual groups, with their separate organisations and with their independent homes. Thus they had the railway engineer, the mechanical engineer, the naval architect, the mining engineer, the sanitary, the gas, the hydraulic, the electrical, the chemical, the marine engineer—species of one genus; the civil engineer, whose home was in that building, whose Institution, like a good mother, tried to keep them all under the protection of her wings, and who was prepared to make any sacrifice to advance the knowledge of engineering, and to maintain the solidarity and reputation of the profession. The Engineering Conference held by the Institution in 1897 was undertaken in the furtherance of that aim, with results so successful as to call for its repetition in the approaching spring of 1899. The foundation of engineering was science, which was a knowledge not only of the facts of Nature, but of the development of her laws. It was, in the language of Huxley, organised common sense. The engineer must be an educated man, educated not necessarily so much in the languages, arts and history of the past, as in the changes and properties of ever present matter, and the forms and behaviour of never-failing energy, changes and transformations directed by his will, controlled by his knowledge and applied by his hands. Tredgold's great definition wanted modification. It should read, "the profession of an engineer is to apply the great principle of work to the use and convenience of man," and his title should be rather that of energeer than engineer. A knowledge of matter and of energy was the foundation of all the engineer's action, and this, combined with the power of thinking so as to enable the brain to direct and assist the hand, was the root of technical training. There was a fashion for technical education just now in Great Britain, and enormous sums of money were being spent. It was well that the country had awakened from its conservatism and apathy, but was it putting its schools in order on a true issue? Our trade was suffering even in our own colonies from the competition of our Continental neighbours, who were said to be beating us by their technically superior hand labour. But was this the true cause? Were we not rather suffering from the superior commercial skill of the principals at home and the accomplished polyglot traveller abroad, as well as from a financial system that was more moral and sound than that rampant in England through the gross abuses of the Limited Liability Act of 1862? In Germany financial support was readily subscribed for a new industry by the generous and enlightened policy of its banks; in England a syndicate, a pioneer company, and, finally, an appeal to the public for an enlarged limited company were required. The industry was established, but with a capital overloaded by the harpies sprung from the operation of that Act. The same industry could be established in Germany with probably half the capital, the manufacture would be supervised with greater skill, and it would be developed as a business by better-trained agents, for educational methods had begun at the wrong end. We ought to teach the masters first and then the men; moreover, we had to teach the teachers and

those who had control of the purse-strings. The county councils of England were scarcely qualified as yet to discharge the very serious duty of properly dealing with a question so few of them understood, though many of them had tackled the matter manfully, especially the London County Council through its Technical Education Board. We were suffering from a lack of competent teachers. A teacher who had had no training in the practical world was worse than useless, for he imparted ideas derived from his inner consciousness or from the false teaching of his own abstract professor, which led to mischief.

Day by day we were startled by some new development of energy in the form of electricity. The president said he learned from Faraday to regard electricity as the result of the play of the atoms and molecules of matter; that it was a mere form of motion, and that its influence through space was due to the existence and operations of a medium—since called the ether. Maxwell crystallised Faraday's views into mathematical language, and deduced the magnificent generalisation that light and electrical waves were of the same kind, moving through the ether with the same velocity and differing from each other only in degree Hertz proved the existence of these waves and measured their lengths, and Marconi had now applied them to the practical purposes of telegraphy. The first practical application of the science of electricity was for the protection of life and property. Franklin, in 1752, showed how to secure ourselves and our buildings from the disastrous effects of a lightning stroke. Very little had been done since to improve on his plan. A mischievous and baseless delusion was prevalent that protectors actually attracted lightning, and might be sources of danger. Every exposed building should be fitted, but a well-protected dwelling-house was the exception, not the rule. Even when protectors were fixed apathy led to their imperfect maintenance. Their failure to act was always traceable to the neglect of some simple rule. Carelessness was the direst disease we suffered from. Telegraph and telephone wires which spread all over our towns and country were very much exposed to the influence of atmospheric electrical effects. Every instrument was now protected. Every telegraph-pole had a lightning-conductor. Accidents were rare, and the system itself was a public safeguard. In some countries like California and South Africa thunderstorms were very frequent and very severe, but their effects had been tamed. The engineer had answered Job's conundrum, "Canst Thou send lightnings, that they may go, and say unto Thee, Here we are?" in the affirmative. He (Mr. Preece) sat on June 12 last in a cable hut on the Welsh coast, near Nevin, with a telephone to his ear, and heard flashes of lightning in Ireland, Scotland, England and Wales on the same afternoon. The sound emitted by a telephone receiver when a discharge took place in the neighbourhood of a telephone circuit was distinctive and characteristic. It was a signal as clear and as comprehensible as the words, "Are you there?" or "Here you are." In 1837 Cooke and Wheatstone showed how electricity could be practically used to facilitate intercommunication of ideas between town and town and between country and country. The first line was constructed in July of that year upon the incline connecting Camden Town and Euston Grove Station, the resident engineer being Sir Charles Fox, father of the senior vice-president. Five copper wires were embedded in wood of a truncated pyramidal section and buried in the ground. The instrument used possessed five needles or indicators to form the alphabet. A portion of this original line was recently recovered *in situ*. He (Mr. Preece) called it the "fossil telegraph," and used it to complete a special circuit between Buckingham Palace and the General Post Office to enable the Queen on her Diamond Jubilee day, as she started on her procession through London, to telegraph her simple message, "From my heart I thank my beloved people. May God bless them!" to all our princes, governors, captains and rulers scattered over the whole globe. To north, south, east and west, over every quarter and every continent, under every ocean and every sea, these words flew with the speed of thought. When Her Majesty returned to Buckingham Palace acknowledgments and replies had arrived from every colony, the first to come being from Ottawa, Canada, sixteen minutes after the message was despatched. The pioneer line of 1837, 1½ mile long, had since spread over the face of the earth to the extent of 1,111,366 miles. In this country we had always been in advance of other countries in telegraphic progress, and that was greatly due to the inventive genius of Cromwell Varley, a member of the Institution. With regard to submarine cables, no one had done more to improve their working than Lord Kelvin. His recording apparatus was almost universally adopted on long cables. By the duplex method of transmission the capacity of cables had been practically doubled, and this had been still further improved by applying to cables the system of automatic working which was such a distinguishing feature of our Post Office system. As for telephones, speech was now practically possible between any two post offices in the United Kingdom. We could speak between many important towns in England and in France. It was theoretically possible to talk with every capital in Europe, and there was now being considered the submersion of special telephone cables to Belgium, Holland and Germany. It was practically possible for every house in the United Kingdom to speak to every other house. The progress of the use of the telephone in Great Britain had, however, been checked by financial complications. It fell into the hands of the company promoter. Telephony was an Imperial business, like the post and the telegraph, and ought to be in the hands of the State. The purchase of the telegraph by the State had not been a bad bargain. Without the telegraph the regulation of the traffic on a railway and the general business of the line could not possibly be conducted. The regulations of the Board of Trade, regarded often as unnecessary interference by railway men, together with the careful engineering inspection before the opening of a line, and a judicial inquiry in case of accident, had tended more than anything else to add to the security of railway travelling. The introduction of electricity into our houses had added materially to the comfort and luxury of home, and was capable of indefinite extension. It was, however, in supplying us with light, without defiling the air we breathed in our dwellings with noxious vapour, that electricity had proved a true benefactor to the human race. It was on board ship that the electric light had been pre-eminently successful. The introduction of electricity into our lighthouses had not been such a unqualified success as in the case of our ships, chiefly owing to the prime cost of its installation and the annual expense of maintenance. Lord Kelvin proposed that lighthouses should signal their individuality to passing ships by flashing their number in the Morse alphabet. The same end was obtained with less mental exertion by occulting and group-flashing systems. We, however, wanted improvement in fogs and storms. Here electricity stepped in. As he pointed out in 1893, the waves in wireless telegraphy are transmitted by the ether; they are independent of day or night, of fog or snow or rain, and therefore, if by any means a lighthouse could flash its indicating signals by electro-magnetic disturbances through space, ships could find out their position in spite of darkness and of weather. Fog would then lose one of its terrors, and electricity become a great life-saving agency. They were nearing that goal. The President also referred to electric traction, electro-chemistry and other branches of electrical science, concluding that every engineer must ultimately become an electrician; and that electricity would be the most general, the most useful and the most interesting form in which he applied the fundamental principles of energy to the wants, the comforts and the happiness of mankind.

On the motion of Sir Frederick Bramwell, seconded by Mr. Edward Woods, Mr. Preece was voted cordial thanks for his presidential address, which was followed by the presentation of medals for the session 1897-98 and by a reception.

LONDON BUILDING REGULATIONS.

AT the Surveyors' Institution a few days ago before the tribunal of appeal, consisting of Mr. Arthur Cates, Mr. A. A. Hudson and Mr. J. W. Penfold, an appeal was heard from Mr. H. W. Hill, Old Bond Street, against the decision of the building committee of the London County Council to sanction the erection of certain buildings in Stanbrook Court, Old Bond Street. Mr. Berry, of the solicitors' office of the London County Council, appeared for the London County Council, and Mr. McMorran, Q.C., for the appellant. The letter of the London County Council stated that they had decided not to sanction certain deviations from the plans certified, but the appellant contended that the plans on which the building was erected had been passed by the committee. It appeared that in May 1897 Mr. Hill, who was rebuilding the premises, had received a notice from the County Council, under the Factory and Workshops Act, to construct a new staircase and other works to provide means of escape in case of fire. For this purpose he acquired the premises in the rear of Bond Street, 5 and 6 Stanbrook Court, and sent to the Council plans which were eventually passed without any restriction. Having this authority Mr. Hill proceeded to erect the buildings, but afterwards received notice from the district surveyor that they contravened section 43 of the London Building Act. The buildings were at that time half-way built, and as the whole, very much through the action of the Council, had cost 40,000*l*., the buildings were proceeded with, and this appeal made. It was agreed that the builders had been under the impression that they had had their plans approved; but the Council contended that the approval was only conditional on their complying with all the conditions of the Building Act. The appellant relied on the letter approving his plans, whilst the Council

contended that section 43 of their Act had been contravened. After hearing some evidence the Chairman stated that, having inspected the building, they considered, taking all circumstances into consideration, the appeal should be allowed, but they made no order as to costs. At the same time he suggested that the consents of the Council be amended. Mr. Berry stated that this had already been attended to.

MANCHESTER SOCIETY OF ARCHITECTS.

IT is the custom of this Society to hold a conversazione about every three years, to which they invite members of other kindred societies for the purpose of mutual enjoyment and intercourse. They held such a social gathering in the City Art Gallery, Mosley Street, on the 27th ult., the whole of which building had been placed at their disposal by the city Corporation. All the galleries were thrown open to the visitors, and, in addition, there was an exhibition of architectural drawings and of several exhibits from the recent arts and crafts collection. The Æolian orchestra, under Mr. G. W. Butterworth, discoursed a choice programme of music. A very large number of ladies and gentlemen accepted the invitations sent out, and they were formally received by Mr. R. J. Bennett, the president of the Society. Amongst the gentlemen present were Sir Bosdin T. Leech, Sir E. Leader Williams, the Dean of Manchester (Dr. Maclure), Colonel Eaton and others.

TESSERÆ.

The Torre Neuva, Zaragosa.

THE planning of the various stages of this steeple is very ingenious: the general outline is octagonal, but the face of the sides is in some cases sunk or set back at an angle to the general face of the work, and at the angles of the upper part corbelled out so as to form octagonal angle turrets. In addition to the play of light and shade aimed at in this way, the whole face of the work is covered with arcades and diapers formed by recessing the panels about an inch and a half back from the face of the bricks which form the dividing lines between them; semicircular bricks are also used with good effect for corbellings, being arranged one over the other like so many small cheeses. Undoubtedly the kind of ornamentation here adopted is one which seems to be specially suited for brickwork, being done with very little trouble or cost; it has, however, a rough character, which harmonises with the rough brickwork of which all the buildings in Zaragosa are constructed, but which would not do so well with that smooth work which we seem invariably to prefer at the present day. Sometimes, however, this panelling of the brickwork is managed with marvellous elaboration of detail, and with really very striking effect; and of this no better example can be seen than the face of the wall of the eastern face of the cathedral church. Here there is a plain unbroken face of wall 60 or 70 feet in length, of great height and pierced with pointed windows at two levels. The wall for about 8 feet from the ground is perfectly plain, above this it is covered with elaborate arrangements of patterns enclosed within horizontal lines of brickwork. These patterns generally have their leading lines formed by single lines of bricks, and consist everywhere of those elaborate star-shaped panels which were always so favourite with the Moorish artists and workmen. The ground of the panels is everywhere sunk about an inch and a half, and then generally filled with glazed tiles of various colours and size and about five-eighths of an inch thick. Sometimes, however, the grounds of the panels are of plaster, in which are set a few single tiles or small patterns of tiles and also some circular tiles with a concave sinking in the centre of each. The openings for the windows have a very elaborate veneering of patterns arranged in continuous consecutive lines round the jamb and arch, but they have unfortunately lost their traceries, which must have been of stone. The bricks used in this work are 13 inches long by 6¾ broad and 1¾ thick, and the mortar joint is about ½ inch thick. Their colour is so much obscured by dirt and age that it is difficult to say exactly what it is, but both buff and pale red bricks are used. The tiles inlaid in the panels are of the peculiarly fine colour generally seen in Moorish work; they are blue, green and white, and all are glazed. The blue is very deep and dark, the green light and bright, and both are varied a good deal in their colour in the way commonly seen in old Moorish work. Nothing can well exceed the elaborate skill with which this work has been done, or the pains and care with which the complicated inlaid patterns have been arranged.

Ancient Irish Tenures.

The heads of septs generally held their estates by tanistry, and the inferior tenants by gavelkind. When each principal owner went into possession of his estate a successor was elected to him, who was called the Tanist, and whom the person in possession had no power to disinherit or bind in any way. When on this owner's death the Tanist became owner, another Tanist was elected. He was not necessarily any relation, though he should be of the sept of his predecessor, the only limitation to his election being that he should be the oldest and most worthy of the blood and surname. Thus each owner was tenant for life, the Tanist being presumptively the next in remainder. By the custom of gavelkind, on the death of any tenant the whole district was newly divided among all the remaining members of the sept who lived in it. The apportionment was made by a person chosen for the purpose, called the Confinny. He had a discretion as to the quality and place he allotted to each, being merely bound to allot the best portions to such as he judged the oldest and most worthy. On the death of each tenant, all his male children, legitimate and bastards alike, but no female, became entitled to get allotments. Under this custom the tenants had no tenure of any certainty—even for a year—their estates, both as to quantity and duration, depending entirely on the mortality of their neighbours.

Memorial Brasses.

On the brasses of civilians the robes are, with rare exceptions, flowing and graceful. In the sixteenth century there was but slight difference between the male and female attire of persons in private life. Of course the dresses of professional men have always been characteristic. Civilians were, with hardly an exception, always represented on brasses bareheaded. Happily for the good people in those times they did not know the hideous and inconvenient hat which continues to torture those who live in towns, but from which men in the country have presumed to free themselves. The dresses actually worn by the deceased are probably sometimes represented on the brasses of ladies. We see every variety of costume, from the simple robe of the time of Edward II. and III., down to the extravagant dresses of Elizabeth's reign. On the early brasses the wimple under the chin marked the rank of the wearer. Till about the year 1550 ladies are not infrequently represented with heraldic devices covering their kirtles and mantles, but such ornamentation was never really worn by them. The different fashions of wearing the hair represented are most fantastic. St. Paul tells us that "if a woman has long hair it is a glory to her;" but these English matrons too often forgot that simplicity which gives to this beauty of nature its chief charm. The butterfly head-dress of the fifteenth century extended 2 feet at the back of the head, and there is the horn head-dress, spreading a foot on either side of the head. The fashions among women then appear to have been grotesque as they have been in our own day. Children are represented either behind or beneath their parents; sometimes they wear the tabard, a short coat, with heraldic figures upon it. Sometimes they wear a dress which marks their occupation, and in a few instances the name of each child is placed below it. Skeletons and emaciated figures, sometimes in shrouds, were represented on brasses after the fifteenth century. Crosses, with or without figures of the deceased, are very frequently to be met with, and their form is exceedingly elegant. The beauty of some of the designs for the canopies of these brasses it would be impossible to surpass.

Edwardian Influence in Western France.

About three miles from Bordeaux are the ruins of the castle of Blanquefort, long the residence of Edward the Black Prince, which appears to have been built for him. Some of the chambers are vaulted in the Decorated style, and under one of the corbels is a British lion. The embrasures in the outer walls have small round openings, with eyelets over them, apparently for cross-bows. Twenty miles to the north-east of Bordeaux is Libourne, one of the principal towns founded by Edward I., which still retains its regular plan, but has lost nearly all other traces of antiquity. The church is plain and late Flamboyant, and the town hall is of the same style. This flourishing commercial town was the ruin of its neighbour, St. Emilion, with its Grotto. This roof is of the same early character as the other vaults. The parish church is dedicated to the Holy Trinity. The nave is of Transition Norman character, of three bays, with domical vaults; the arches pointed, the windows round-headed, and the west doorway good late Norman, with sculpture; the aisles are early French; the choir and apse are good Flamboyant work, with the original painted glass; the vaults have also preserved the old painting. There are remains of two other churches, both in the style of the fourteenth century; that of the Cordeliers has the walls and windows nearly perfect. The castle is a square Norman keep, with corner turrets. It is said to have been built after 1224, but the small narrow windows are all round-headed and the whole character is that of the twelfth century. It seems much more probable that there is some error in the histories of this town than that its buildings should be so much behind all others of similar character. That is,

however, matter of opinion; some persons consider that the Romanesque style continued in use in the South of France to a much later period than in the northern provinces or in England. There is certainly great resemblance between the south of France and Italy in many respects, and this may be another instance of that similarity. A few miles beyond St. Emilion is St. Foy, another of the towns founded by Edward I., on the same regular plan, with a square market-place in the centre, surrounded by arcades wide enough for two carriages to pass and high enough for a loaded waggon or diligence to pass under. All the streets are in straight lines crossing at right angles, with narrow lanes between the streets at regular intervals. The houses are chiefly modern, but a few are of the sixteenth century, and there are turrets at the corners of several of the streets. The church is modern, but the west end is of the fourteenth century with a good doorway and arches on each side of it. The suite of mouldings of the doorway is unusually rich for France, as French architecture in general has a remarkable paucity of mouldings compared with English, but this is more the case with their windows than their doorways.

Titian's "Bunch of Grapes."

The highest finishing is labour in vain, unless at the same time there be preserved a breadth of light and shadow; it is a quality therefore that is more frequently recommended to students and insisted upon than any other whatever, and perhaps for this reason, because it is most apt to be neglected, the attention of the artist being so often entirely absorbed in the detail. To illustrate this we may have recourse to Titian's "Bunch of Grapes," which we will suppose placed so as to receive a broad light and shadow. Here, though each individual grape on the light side has its light and shadow and reflection, yet altogether they make but one broad mass of light; the slightest sketch therefore where this breadth is preserved will have a better effect, will have more the appearance of coming from a master-hand—that is, in other words, will have more the characteristic and generale of nature than the most laborious finishing where this breadth is lost or neglected.

CORRESPONDENCE

The Sanitary Inspectors' Association.

SIR,—In your report of the annual meeting of this Association, which appeared in a late issue of your Journal, reference is made to one of the auditors having remarked that something would have to be done to increase the income or decrease the expenditure, otherwise the Association would soon be in a state of bankruptcy. A report of this kind is calculated to injure the Association, and in order to prevent a wrong impression being circulated I should be glad if you would kindly insert this letter in your next issue.

The financial statement for the past year shows that we have a capital account balance in our favour of considerably over 3,000*l.*, and this by no means looks like our being in a bankrupt state. Of course we are bound to admit that the annual expense which has been incurred by the Association in promoting the interests of not only the members of the Association, but also of every sanitary inspector in the kingdom has been a severe tax upon our funds, and, as in the case of all similar associations, great care has to be taken to make the income and expenditure balance (which this year it does not quite do, and to this the auditor referred). With the large membership which is constantly being augmented, there need be no fear of the Association ever becoming in a bankrupt state.—We are, faithfully yours,

T. J. MOSS FLOWER, Chairman of Council.
EDWARD TIDMAN, Hon. Secretary.

Connaught Mansions, 34 Victoria Street, Westminster:
October 27, 1898.

Roman Remains in Hayling Island.

SIR,—Antiquarians within reach of this place may be glad to know that the foundations of the Roman building in "the Towncil Field" here have been to a considerable extent laid bare and, through the courtesy of the occupier of the land, may be seen for a few days before the ground is required again for farming purposes. Few objects have been found save nails, bits of coarse pottery and the débris usually met with in such operations. Working alone and depending entirely on my own spade and pickaxe, I have not been able in the time at my disposal to excavate the site as thoroughly as might be wished, but the general outline of the edifice may be recognised.—I am, sir, yours faithfully, TALFOURD ELY.

Stoke, Hayling Island: October 29.

The British School at Athens.

SIR,—In your report of the annual meeting of the British School at Athens you say that "Professor E. A. Gardner, former director, went in May to advise the Greek Government with regard to the consolidation of the Parthenon." I think a line must have dropped out. I was in Athens in May with a party of students; but of course it was Mr. F. C. Penrose who went out to look after the Parthenon.—I am, yours truly,

ERNEST A. GARDNER.

University College, Gower Street, London, W.C.:
October 31, 1898.

Dry Rot.

SIR,—Can any of your readers tell me what is the best thing to do to prevent the spread of dry rot which has shown itself in a house where new rooms have been added? SENEX.

Oakfield, Forest Row, Sussex:
October 30, 1898.

GENERAL.

M. Carolus-Duran was on Saturday elected successor of the late Puvis de Chavannes as president of the Société Nationale des Beaux-Arts. He has appointed the following presidents of sections:—Painting, M. Roll; sculpture, M. Rodin; engraving, M. Waltner; "objets d'art," M. Cazin.

M. Gérôme, the French painter, but who has recently undertaken works of sculpture, has completed his model of the memorial of the Duc d'Aumale which is to be erected at Chantilly. His assistants are enlarging it in order that the casting in bronze can be undertaken.

The Hermione Lectures, established at Alexandra College, Dublin, in memory of the late Duchess of Leinster, commenced on Wednesday. The lecturer this year is Miss Jane Harrison, LL.D., D.Litt., and the subject the "Parthenon Marbles."

The Académie des Beaux-Arts on Saturday announced the bestowal of the grands prix de Rome as follows:—Painting, MM. Gibert and Laparra, MM. Benner and Guétin; sculpture, M. Alaphilippe, MM. Boucher and Terroir; architecture, M. Chifflot, M. Auburtin; engraving, M. Corabœuf, MM. Quidor and Busière; musical composition, M. Malherbe.

The Swiney Prize, consisting of a cup designed by D. Maclise, R.A., and a sum of 100*l.*, will be awarded by the Society of Arts in January next for the best published work on jurisprudence.

The Members of the Stock Exchange propose to subscribe 500*l.* for a painting to fill one of the panels in the Royal Exchange.

The Museum at Olympia has, according to the *Standard* correspondent, suffered great damage through the excessive rains. The celebrated marble statue of Hermes, by Praxiteles, is well placed, and is itself in no danger; but the Minister of Public Worship has ordered repairs to be done to the Museum, which is in an unsafe condition, notwithstanding that within ten years defects have been thrice remedied.

The Late Mr. James Pyke Thompson has bequeathed to the Cardiff Museum and Art Gallery a gift of pictures, prints and porcelain valued at £4,000. The oil-paintings include a unique example of George Romney's work, entitled "The Bleaching Ground"; "Cardigan Bay," by David Cox; and "Gipsies Resting," by G. F. Poole, R.A. Among the water-colours are eight sketches by Cox and a fine drawing of "Ewenny Priory," by J. W. M. Turner.

The Foundation-stone of the new blocks of St. Marylebone Workhouse has been laid. The work will cost £52,100.

Colonel George Waring, the sanitary engineer, and who wrote largely on sanitary science, died on Saturday in New York, aged sixty-five. He examined the camp sites in Cuba, and developed yellow fever after returning.

The Offer of Mrs. Hopkinson, Mr. Bertram Hopkinson, B.A., of Trinity College, and Miss Ellen Hopkinson to give 5,000*l.* for an extension of the engineering laboratory, Cambridge, to be erected in memory of the late John Hopkinson, M.A., and the late John Gustave Hopkinson, has been gratefully accepted.

The Duke of Cambridge on Monday laid the foundation-stone of the Town Hall, Colchester, of which Mr. John Belcher is architect.

Mr. Lewis Angell reports that works of the value of 574,224*l.* are either in execution or preparation in his department as borough engineer to the Corporation of West Ham.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

ABERAVON.—Dec. 1.—Plans are invited, with estimated cost, for the extension of the covered market. A premium of twenty guineas will be awarded to the architect whose plans shall be selected. Mr. Jas. Roderick, borough surveyor, Aberavon.

SWINDON.—Nov. 7.—The Guardians of Highworth and Swindon Union invite designs and plans from architects for making additional accommodation at the workhouse infirmary. Architects intending to compete will please send in their names to Mr. J. P. Kirby, clerk, 42 Cricklade Street, Swindon.

CONTRACTS OPEN.

ALNMOUTH.—Nov. 9.—For an addition at Croft House. Mr. M. Temple Wilson, architect, Alnwick.

ALTRINCHAM.—Nov. 11.—For erection of offices, council-chamber, fire station, caretaker's house, &c. Messrs. Hindle & Davenport, architects, 16 Market Street, Altrincham.

ARBROATH.—Nov. 14.—For erection of a post office. Mr. George Morham, 39 George Street, Edinburgh.

BARRASFORD.—Nov. 18.—For alterations and additions to the parochial schools. Messrs. Armstrong & Knowles, 38 Grainger Street, Newcastle-on-Tyne.

BEDWORTH.—Nov. 7.—For erection of miners' central offices, with residence adjoining. Mr. Thos. F. Tickner, architect, 7 Bishop Street, Coventry.

BELFAST.—For erection of stores and stabling, Queen's Bridge. Mr. W. J. Moore, architect, Whitehall Buildings, Ann Street, Belfast.

BELFAST.—For erection of block of dwelling-houses, Falls Road. Mr. W. J. Moore, Whitehall Buildings, Ann Street, Belfast.

BINGLEY.—Nov. 8.—For additions to the Crossflats Board schools. Mr. Wm. Rhodes Nunns, architect, Market Street, Bingley.

BIRKENHEAD.—Nov. 14.—For erection of public baths in Corporation Street and Prince Street. Mr. Charles Brownridge, borough engineer, Town Hall, Birkenhead.

BIRMINGHAM.—Nov. 11.—For providing an escape staircase at the workhouse, for work in connection therewith, and for lavatory fittings. Mr. Ward, architect, Paradise Street.

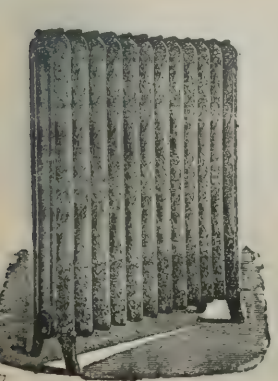
BISHOP AUCKLAND.—For erecting a corrugated iron roof with pillars to support same. Mr. Farr, coachbuilder, Bishop Auckland.

BLACKBURN.—Nov. 10.—For erection of a conservatory in the Corporation Park. Mr. William Stubbs, engineer, Municipal Offices, Blackburn.

BLACKBURN.—Nov. 11.—For erection of farmhouses and buildings, Yate Bank. Messrs. Sames & Green, architects, 65 Northgate, Blackburn.

BRADFORD.—For erection of a doctor's residence. Mr. John Jackson, M.S.A., architect, Barry Street, Bradford.

BRADFORD.—Nov. 10.—For erection of stabling. Messrs. Thompson McKay & Co., Limited, 7 Leeds Road, Bradford.



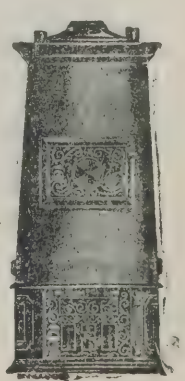
BRIDGEND.—Nov. 24.—For erection of a chapel at Parc Gwyllt Asylum. Messrs. Giles, Gough & Trollope, architects, 23 Craven Street, Charing Cross.

BURNLEY.—Nov. 7.—For erection of three dwelling-houses, &c., at Bank Parade. Mr. Robert Neill, architect, 9 Grimshaw Street, Burnley.

CARDIFF.—Nov. 9.—For supply and erection of iron sheep and cattle troughs and wood troughs in cattle stalls and pens in Roath Market. Mr. W. Harpur, borough engineer, Town Hall.

CARDIFF.—Nov. 15.—For erection of a fish market and offices at the Hayes. Mr. W. Harpur, borough engineer, Town Hall, Cardiff.

CARMARTHEN.—Nov. 18.—For erection of a stone bridge of three arches and approaches thereto over the river Towy at Dryslwyn. Mr. Thomas Codrington, Shire Hall, Carmarthen.



BERRY, CAMPBELL & CO.

WARMING & VENTILATING ENGINEERS,

62 WATLING STREET, QUEEN VICTORIA STREET.

Heating by Hot Water, or High or Low Pressure Steam, expeditiously carried out on the most approved principles. Special attention given to Private Residences.

ESTIMATES FREE.

CHATHAM.—Nov. 9.—For the following works at the Medway union workhouse:—(1) Erection of additional rooms and alterations to the quarters of the superintendent of the casual wards; (2) erection of a new infirmary ward, new lavatories and various alterations in the infirmary. Mr. G. E. Bond, architect, High Street, Rochester.

CORK.—Nov. 14.—For erection of offices for the Cork Electric Tramway and Lighting Co., adjoining the power-house, Albert Street. Mr. Robert Walker, architect, 17 South Mall, Cork.

COVENTRY.—Nov. 9.—For erection of schools at Radford. Messrs. George & Isaac Steane, architects, 22 Little Park Street, Coventry.

COVENTRY.—Nov. 12.—For erection of buildings at their proposed two new pumping stations on the side of the main road from Coventry to Daventry. Mr. James Mansergh, 5 Victoria Street, Westminster.

DARLINGTON.—Nov. 7.—For extensive additions to works in Kinross Street and Upper John Street, for the North of England School Furnishing Company, Limited. Secretary, North of England School Furnishing Company, Limited, Darlington.

DRIFFIELD.—Nov. 17.—For erection of the new church of St. John's. Messrs. Hicks & Charlewood, architects, Driffield.

DRIGHLINGTON.—For alterations to the Valley inn. Mr. A. D. Kaye, architect, 71 Albion Street, Leeds.

DULWICH.—Dec. 1.—For additions and alterations to the school premises, East Dulwich Grove. Mr. Arthur J. Gale, architect, 4 Serjeants' Inn, Fleet Street, E.C.

EASTBOURNE.—Nov. 7.—For alterations to the existing boundary wall and the provision of wrought-iron fencing to the storm-water reservoir, Sidley Road. Mr. R. M. Gloyne, borough engineer, Town Hall, Eastbourne.

EDINBURGH.—Nov. 7.—For erection of hotel at Princes Street Station. Messrs. Peddie & Washington Browne, architects, 8 Albyn Place, Edinburgh.

ELGIN.—Nov. 8.—For reconstruction of the Elgin Brewery. Mr. George Sutherland, architect, Elgin.

ESSEX.—Nov. 10.—For erection of a classroom at the Cressing National school. Plan and specifications may be seen at Cressing Vicarage.

EXMOUTH.—Nov. 12.—For rebuilding the White Hart inn, Back Street. Mr. Proctor Sherwin, architect, Manchester Street, Exmouth.

EXMOUTH.—Nov. 7.—For alterations and portion of new roof at The Lawn. Mr. Ernest E. Ellis, 20 Morton Road, Exmouth.

HALIFAX.—Nov. 7.—For erection of conveniences at Portland Road Board school. Mr. W. H. Ostler, clerk, 22 Union Street, Halifax.

HALTWHISTLE.—Nov. 7.—For erection of the Mechanics' Institute. Messrs. Oliver & Dodgshun, architects, Carlisle.

HITCHIN.—Nov. 8.—For erection of a town hall and offices on a site at the corner of Brand Street and Grammar School Walk. Mr. E. W. Mountford, 17 Buckingham Street, Strand, W.C.

HOLBROOK.—Nov. 16.—For works at Holbrook schools. Mr. Edward Fernley Bisshop, architect, 32 Museum Street, Ipswich.

HORSHAM.—Nov. 9.—For additions and alterations to the Sussex Oak Inn, Warnham. Mr. C. H. Burstow, architect, 6 West Street, Horsham.

IRELAND.—For sanitary work required at cottages, Whitehead, co. Antrim. Mr. John Russell, architect, 16 Waring Street, Belfast.

KEIGHLEY.—Nov. 11.—For erection of a workshop and foundry, adjoining Goulbourne and Starkie Streets. Messrs. Barber, Hopkinson & Co., architects, Craven Bank Chambers, North Street, Keighley.

KENT.—Nov. 13.—For additions to the hospital at Skym Corner, Bromley Common. Mr. John Ladds, architect, 7 Doughty Street, Mecklenburgh Square, W.C.

LAUNCESTON.—Nov. 12.—For erection of cattle, sheep and pig market. Mr. Otho B. Peter, architect, Launceston.

LLANELLY.—Nov. 8.—For erection of an infant school at Pontyberem and a classroom in connection with the mixed department. Mr. J. B. Morgan, architect, New Road, Llanelly.

LONDON.—Nov. 15.—For erection of public conveniences at Blackwall Tunnel (north side), for the London County Council. Particulars at the Architect's Department, General Branch, 13 Spring Gardens, S.W.

LONDONDERRY.—Nov. 10.—For erection of fifteen houses at Phillip Street, Strand. Mr. Edward J. Toye, architect, Strand, Derry.

WIGAN.—Nov. 14.—For erection of a county court and inland revenue offices for the Commissioners of H.M. Works and Public Buildings. Messrs. Hunt & Steward, 45 Parliament Street, London, S.W.

AN EXPLANATION AND APOLOGY.—In our issue of *The Architect* for September 23 we made certain statements with reference to proceedings by the London County Council in regard to a building in Victoria Street, Westminster, of which Mr. C. J. C. Pawley is the owner and architect. We also made editorial comments reflecting upon the professional ability and reputation of Mr. Pawley. We find that the statements in question were inaccurate, and that we were not justified in making them, nor were we justified in our editorial comments reflecting on the ability and reputation of Mr. Pawley. That gentleman has instituted proceedings against us in respect of these matters, which he has consented to stay on payment of his solicitor's charges, on our making a donation of ten guineas to the Abbey Mansions Accident Fund, and on our apologising. We therefore beg to apologise and to express our regret to Mr. Pawley for having made the erroneous statements in question and for the reflections cast upon him, for which we admit there was no justification.

TENDERS.

Watson, Ascot	£625 0 0

THE "PRESTO" POCKET CAMERA.

Messrs. Marion & Co., of Soho Square, who enjoy a world-wide fame for photographic apparatus and appliances of all kinds, may undoubtedly take credit for having introduced the smallest, lightest and least expensive camera yet brought out. It is called the "Presto," and is convertible at will into a glass-plate or a film camera. It is an American invention, and its weight, including a charge of twenty-five films, is only six ounces, while its dimensions and shape adapt it admirably for carrying comfortably in the pocket, which can hardly be said of most of the pocket cameras hitherto offered. There is no mechanism to get out of order, the lenses, which are of the fixed focus type, are all subjected to careful test, and the pictures taken by the "Presto," albeit necessarily small (they are about 1¼ inch square) are of remarkable sharpness, and lend themselves admirably to enlargement. Everything about the "Presto" camera is of such extreme simplicity that it will be welcomed as a boon by cyclists and others, to whom its portability will at once recommend it, and its price, loaded ready for use, is only 10*s.* 3*d.* free by post.

ELECTRIC NOTES.

AN electrified bridge which recently shocked a number of men and horses in Chicago is stated by Mr. A. G. Riter, city bridge engineer, to have received its charge from a broken live wire. This came in contact with the ironwork of a draw-span, which transmitted the current to wet woodwork, and in this way caused the trouble. The structure was what is known as the Harrison Street bridge, and while the electricity wandered about for a short time only, it caused enough annoyance to show the importance of preventing such currents from straying.

AT last week's meeting of the Winsford Urban Council the question of lighting the district by means of electricity was discussed. It was reported that the first installation to light the whole of the main streets would cost 7,700*l.* A member gave notice that in a month's time he would move that application be made to the Board of Trade for a provisional order granting powers to the Urban Council to undertake public electric lighting.

SOME dissatisfaction has recently been expressed in Edinburgh at the want of pressure in the electric-lighting mains. This, it appears, has been caused by the extraordinary demand for the light, which has necessitated new machinery being pushed forward at high pressure, and considerable alterations made to the accessories and the boilers. This work is expected to be finished in a few days, when the pressure will be kept up constantly to its normal strength.

AT a special meeting held at Rhyl, under the presidency of Mr. J. H. Ellis, the general purposes committee recommended that, "In the face of notices of intended applications for electric light for Rhyl served upon the Council, and recognising that the time has come for the Council to take action themselves to supply the district with electric light, this committee be empowered to engage an engineer for taking immediate steps to formulate a scheme, combining provision for a dust destructor, with power also to engage legal assistance as may be necessary for compliance with the Act and the rules with respect to applications to the Board of Trade for a provisional order under the Electric Lighting Act, 1882 and 1888." The proposal was carried after some discussion.

AT a meeting on Monday of Arbroath Town Council as the Gas Corporation it was unanimously resolved, on the motion of Provost Grant, to apply to the Board of Trade for a provisional order, to be confirmed by Parliament, to authorise the Corporation to supply electricity for public and private purposes within the burgh. Itwas remitted to the committee of management to define the area of supply, with the names of the streets in which the electric lines should be laid down, and to prepare a statement of the sums proposed to be expended.

TRADE NOTES.

THE Holmes Wood New School, Rufford, near Preston, is being warmed and ventilated by means of Shorland's patent Manchester grates.

MR. EDWARD TURNER, of Newcastle-under-Lyme, who recently renewed the nave of the parish church in that town in commemoration of the Queen's Diamond Jubilee, has accepted the tender from Messrs. Jones & Willis, of Birmingham, to provide pews in the aisles to correspond with the seating of the nave, the design being that of Mr. J. Lewis, of Newcastle. The total cost will be about 600*l.*

BUILDING AND BUILDERS.

AT a meeting of the Berwick Town Council a letter was read from the Local Government Board, sanctioning the proposal to borrow 7,000*l.* for the erection of a new lock-up and police station.

THE carpenters and joiners of Wakefield have decided to give notice for an advance in wages of ½*d.* per hour, making 8*d.* per hour. They are also asking for a code of working rules.

AFTER long consideration, the Haworth District Council have decided to sewer their district, and have made application to the Local Government Board for 10,000*l.* for the purpose of carrying out the works.

THE Glasgow Corporation contract for 1,000 tons of water pipes, which was recently awarded to a Philadelphia firm, has come back to the Glasgow firm who first offered, the American producers being unable to guarantee delivery.

THE death is announced of Mr. James Muirhead, of the Cart Forge, Crossmyloof, Glasgow, who was the oldest iron-founder in the West of Scotland. Deceased, who was born in 1807, began business in 1824, and founded the Cart Forge in 1848.

THE contract for the new Admiralty Docks and the harbour works at Gibraltar has been given to Messrs. Topham, Jones & Railton, of Westminster. The works are expected to cost between 2,000,000*l.* and 3,000,000*l.*

THE foundation-stone has been laid of the Victoria Diamond Jubilee extension of the Stockport Infirmary The extension is the result of a public subscription at the Jubilee for the infirmary and the Sick Poor Nursing Association, and is costing over 10,000*l.*

AT a meeting of Aberdeen Town Council on Friday it was resolved to proceed with extensive new sewerage works for the city. The estimated cost of the scheme is 99,765*l.*, from which has to be deducted the cost of a portion already sanctioned—4,925*l.*—thus making the actual outlay 94,840*l.*

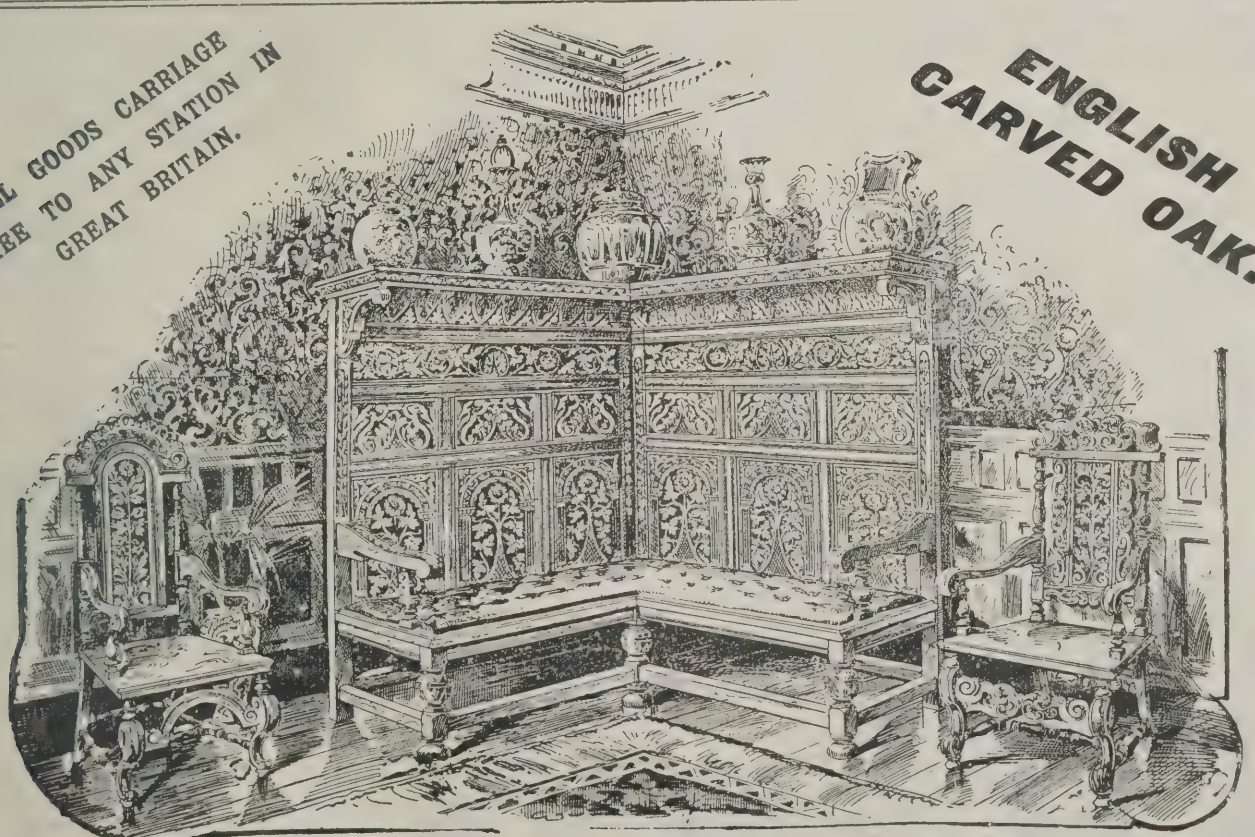
ON Friday afternoon, as James Macnab, 21 years of age, plasterer, was working at a new house in Main Street, Tweedmouth, the scaffolding gave way. Macnab fell from a height of about 30 feet, and was impaled upon the spikes of some iron railings which pierced his heart and caused almost instantaneous death.

ST. JOHN'S SQUARE CHAPEL, Clerkenwell, from which is carried on the main work of the London Central Wesleyan Mission, is being enlarged at a cost of about 10,000*l.* The foundation-stone was laid on Wednesday.

WHILE some alterations were being carried out on Wednesday in an old beer-house at Byker, Newcastle, involving the removal of the front, the premises collapsed, and Mathew Fitzgerald, a labourer, was killed.

THE Caledonian Railway Company have decided to extend the Glasgow Central Station by erecting a new station to the south of Argyll Street, property and land for which have already been purchased, and also to erect a new bridge across the river to Bridge Street Station, to the west of the existing bridge. No definite plans have yet been adopted by the directors, but a Bill for carrying the project into effect is being formulated for presentation to Parliament next session.

THE Catholic community in Carnarvon have decided, in consequence of the growth of Catholicism in the district, to erect a pro-cathedral at a cost of 10,000*l.* The scheme has the support of Bishop Mostyn, and many wealthy Catholics in North Wales have promised large subscriptions.



THE Wolverhampton Board of Guardians, over whom Mr. J. Cope presided, were occupied for a considerable time on Friday last with again considering the plans for the new workhouse which is to be erected at Wednesfield. Mr. Aldwinckle, the assessor, wrote supplying more details as to the plans, and the clerk (Mr. E. Pritchard) informed the board that that morning the new workhouse committee had held a meeting, when the members passed a resolution confirming their recommendation to the board to employ as architect for the new workhouse Mr. Arthur Marshall, of Nottingham, whose plans bore the motto "North and South," the estimated cost for carrying out the work being 129,000*l.*, though it was believed, according to a statement of the clerk, that the amount could be reduced by 12,000*l.* After considerable discussion the recommendation of the workhouse committee was adopted unanimously.

A LARGELY attended meeting of members of the Leeds branches of the Amalgamated Society of Engineers was held on Tuesday in the Albert Hall, Cookridge Street, to consider the offer of the masters, made through the committee of the Employers' Federation, of an advance of wages of one shilling per week. This offer was made at a conference held in London on Wednesday last between the employers' committee and delegates from the Leeds branches of the men's society, who were accompanied by Mr. Barnes. The men had sought an advance of two shillings, but when, on Friday last, the local executive met to receive the report of the delegates the tone of the proceedings was favourable to the acceptance of the smaller advance offered. At last night's meeting a ballot was taken on the matter, and by a large majority the men decided to accept the employers' proposal.

ONE of the finest old churches in Central France has fallen in, and is now a complete ruin. It is the parish church of Montluel, in the Rhône Department, and was built in the purest style of the thirteenth century.

VARIETIES.

A CLERGY-HOUSE has been built for St. Mary's, Doncaster, at a cost of 1,200*l.*

THE new schools just erected in connection with the Congregational Church, Colne, were formally opened on Saturday. The cost of the new building is about 2,200*l.*

THE first portion was opened last week of a new borough sanatorium at Brighton, which is 10 acres in extent and over 300 feet above the mean sea level. The new buildings will cost about 19,775*l.*

THE parish church of East Acklam, near Malton, Yorks, is being closed for the winter owing to the unsafe state of the edifice. The foundations of the west end of the church have been found to be in a very unsatisfactory condition, and large cracks are visible in the walls.

ST. MILDRED'S CHURCH, Bread Street, was reopened on the 27th ult., after having been shut since June 1896, to undergo repairs. The service was attended by the Lord Mayor and Sheriffs in state, the Master and Wardens of the Court of Cordwainers and by representatives of the Court of Common Council, namely, Messrs. Hawtrey, Coates and Steinberg.

THE session of the Auctioneers' Institute will commence on Tuesday next, the 8th inst., when Mr. Alexander Macmorran, Q.C., will read a paper in the Lecture Hall, 57 Chancery Lane, upon "The Effect of Recent Decisions on the Liabilities and Rights of Owners in respect of the Drainage of Buildings." The chair will be taken by the president, Mr. Edward Dobson, at 7.45 P.M.

AN extensive addition to the Cheshire County Lunatic Asylum, near Chester, was formally opened on Monday. The extension, which has cost about 90,000*l.*, provides accommodation for 400 additional patients, and includes a new administration block. The whole institution is handsomely equipped, and lighted throughout by electricity.

AN extraordinary scene was witnessed recently at Feltwell, in Norfolk, where the tower of St. Nicholas's Church has been under repair, and girt round with scaffolding. Suddenly, while the workmen were at breakfast, the tower swayed and then fell with a tremendous crash into the churchyard, wrecking gravestones, filling the place with rubbish, and sending up clouds of dust. The belfry contained a fine peal of bells, which were scattered in all directions.

ST. MICHAEL BASSISHAW, Basinghall Street, London, one of Wren's churches, is marked for destruction. The original church dated from 1676-79, with the exception of the tower, which survived the great fire of London, and was patched up to help to lessen the cost of rebuilding, recorded at 2,823*l.* The church has been closed for some time, the parish having been united with that of St. Lawrence Jewry.

ON the roof of a brewery at Maidstone is to be seen one of the most remarkable vanes in England. It represents an old brown jug and beaker. The jug, which is made of copper, stands 3 feet 6 inches in height, is 3 feet in diameter, and is capable of holding 108 gallons. The beaker, also of copper, has a holding capacity of 8 gallons.

JUST after two o'clock on the 29th ult. the premises of the *Guardian* office, Lancaster, partially collapsed with a great crash into the street. Building operations were going on adjoining, and the Corporation also intended to pull down the *Guardian* office subsequently. One-half of the building, containing a valuable stock, collapsed from roof to cellar. No one was on the premises when the accident happened.

THE Mayor of Durham opened on the 13th ult. extensive new schools at St. Godries, Durham, for some 700 pupils. The material employed on the exterior is red-pressed brick with slated roof. The building consists of two storeys, the upper one being the boys and girls' department, and the lower one the infants. Mr. Charles Walker, of 26 Eldon Square, Newcastle-on-Tyne, is the architect.

ON October 29 a new Catholic school was opened at Birtley, co. Durham. The building is finely situated, and commands an extensive view of exceedingly pretty country. It is of the most modern construction, the rooms being lofty and well ventilated, and amply provided with every requisite for giving instruction. Accommodation has been provided for over 300 scholars. The works have been carried out by Messrs. J. Burnett & Son to the design of Mr. Charles Walker, architect, of 26 Eldon Square, Newcastle-on-Tyne.

A FIRE occurred early on Saturday morning in Viewforth Free church, Gilmore Place, Edinburgh, by which the once handsome building was in the space of a few hours practically gutted. No satisfactory solution of the cause and time of the outbreak has as yet been arrived at, but there is little reason to doubt that it had its origin in the motor-room or its vicinity, and, the motor being an electric one, it is regarded as probable that the conflagration was in some way associated with its working —possibly through a fusion of the wires.

PRICE LIST AND ESTIMATES ON APPLICATION.

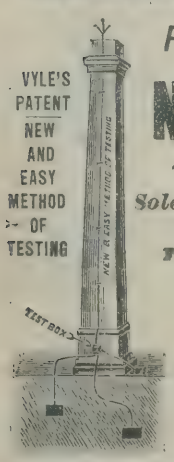
THE formal completion of additional waterworks designed by Mr. James Wilson, C.E., Edinburgh, took place recently at Parkhill, near Port Glasgow. The works consist of a pure water tank capable of holding 500,000 gallons, and two new filters of about 800 square yards, the cost being 4,000*l.* The contractors were Messrs. D. Cunningham & Sons, Kilbarchan. The ceremony of formally laying the last copestone was performed by Provost Rodger. It is calculated that in this department the requirements of the burgh have been met for the next twenty years.

MESSRS. DOUGLAS YOUNG & CO. will offer for sale by auction on Thursday next, the 10th inst., the extensive Hooley estates situated in Wiltshire and Essex. The villages included in the sale are quaint specimens of rural simplicity, most of them having been in existence for centuries, but in their present state they form types of model neatness. Enormous sums must have been spent upon improvements, for old, dilapidated cottages are transformed into good sanitary dwellings, new cottages have been built, and the farm buildings thoroughly repaired. The farmhouses are of quite a superior class, and present the appearance of important country residences standing in their own grounds and occupying exceptionally well-chosen sites.

AN important scheme for the provision of new municipal offices at West Bromwich is about to be commenced, the same involving an expenditure of 5,500*l.* In addition to the offices required by the Corporation servants, a new reception-room (45 feet by 35 feet) and a council chamber (40 feet square) are included. For the use of the School Board there will be three offices, a strong-room and store-room, and the Board will have the use of the council chamber and one committee-room for their meetings. The new market hall is to be converted into a free library, with a lending department 74 feet long by 23 feet wide, a reading-room 48 feet by 40 feet, and a news-room 54 feet by 40 feet. Provision will be made for the reference library, committee-room, librarian's-room, and also for subscription library. The building will be wired ready for electric lighting.

SOME time ago the Edinburgh Town Council, on a motion by Councillor M'Michael, resolved to erect a new bridge over the Water of Leith at Bonnington. Negotiations were afterwards opened with the Corporation of Leith, a portion of the bridge being in that burgh, and a deputation from Edinburgh, consisting of Councillors Dunlop, Cameron, M'Michael and Waterson, had an interview with the Leith Town Council on the subject. The Leith representatives present were Provost Bennet and Councillor Baxter, and they acquiesced in the Edinburgh proposals. The only point remaining to be adjusted is the proportion of cost which each municipality should be asked to bear. The proposals, which involve an expenditure of over 5,000*l.*, include the widening and levelling of the roadway up to the railway station.

ON October 27 the commencement was made of a new Catholic church at Hanley, co. Durham, a town of recent growth in the centre of a very populous mineral district. The designs for the church show accommodation for about 700. The buildings are to be in the Early English style, stone and slated. The body of the church consists of single span nave and transepts, with west end gallery, and provision for possible galleries in both transepts. The main and two side altars are in separate apses. There are separate sacristies for clergy and servers in communication with the presbytery and the east end of the church, and confessionals and baptistery are offshoots from the main building. The whole is to be heated by hot-water apparatus. The architect is Mr. Charles Walker, of 26 Eldon Square, Newcastle-on-Tyne.



A NEW Catholic school at Marton, co. Durham, was opened on October 28. The buildings are to accommodate about 100 infants and 150 mixed children. They are of red brick, slated, and consist on the ground floor of a main building containing schoolroom, cloak-rooms, &c., and with two side wings, divided into classrooms and screened from the schoolroom by movable glazed partitions. The south wing is devoted to babies and infants. Owing to the ground levels a portion of the buildings is cellared and to be used for dinners, playrooms and heating apparatus. The whole is heated by hot-water apparatus. The works have been carried out by Mr. J. B. Stoll, contractor, of Sunderland, under the supervision of Mr. Charles Walker, of 26 Eldon Square, Newcastle-on-Tyne.

THE new club-house recently erected at the junction of Devonshire Street and Scott Street for the Keighley Liberal Club, although in occupation for some time, was formally opened on Saturday by Mr. Asquith. The new building, whose gable is surmounted by a conical tower, is of two storeys, and the whole of the commodious club premises proper are situated on the ground floor. Besides news and smoke-rooms, library and bar, there is a good billiard-room, in which there is space for four tables and an ample margin. In point of lighting, ventilation and upholstering, the room is admirably

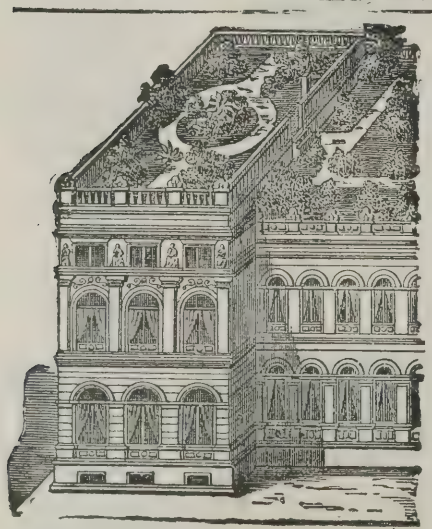
arranged. All the rooms are lofty. Accommodation for the curator is provided on the first floor, the principal part of which is taken up by a lecture-hall, 41 feet by 37 feet, capable of accommodating 800 persons, and a smaller room for use by the Women's Liberal Association. The cost for land and building has been between 5,000*l.* and 6,000*l.*

THE new vestry which has been added to St. John's Church, Carlisle, as a memorial of the Queen's Diamond Jubilee was dedicated on the 13th ult. It has been built at the north-east end of the church, and abuts on to Close Street, from which it is entered. The plans of the building were drawn by Mr. Henry Higginson, architect, and the addition has been built in harmony with the church, care having been taken not to depart from the original character of the building. The vestry is 33 feet long by 22 feet broad, with an average height of 18 feet, and it replaces an old vestry which was only 12 feet by 10 feet. The room is divided into two parts by a folding screen, one part being intended for the clergy and the other for the choir. When the screen is open the room is large enough to seat about sixty people, and it will thus be very useful for all kinds of parochial meetings, which have now to be held in the schools. The internal fittings are all of pitch pine, the roof is an open one, and wooden blocks have been used for the floor. Lavatory accommodation has also been provided. The building is lighted by a three-light lancet window in the north wall and a single-light window in the east wall, the lights being glazed with cathedral glass in diamond quarries.



THE stability of Ayr "Auld Brig" has been further seriously threatened. The flood in the Ayr on Tuesday night of last week was the highest that has been known for many years, and it was feared that the effect on the bridge in its damaged state would be to still further place it in jeopardy. These fears have to some extent been realised. The huge block of masonry forming part of the middle arch, which had been detached by the previous flood, was completely washed away, leaving a triangular gap from the foundation upwards, and exposing the interior rubble masonry to the action of the water. What is the exact state of matters at the foundation of the pier has not yet been ascertained, as the river is still in too flooded a state to allow of an examination, but there can be no doubt that unless something is done at once the bridge is doomed. As showing the tendency of things, a fresh crack has made its appearance in the parapet above the arch which stands over the damaged part of the pier, and it would seem as if the collapse of the structure was inevitable.

A SERIOUS outbreak of fire occurred in the early hours of Tuesday morning at the premises of Messrs. J. Duckett & Son, Limited, sanitary ware works, Accrington Road, Burnley. Some night workmen who were engaged looking after the kilns first observed the outbreak, which occurred in the brick-making room situated immediately over the boiler and engine house. Owing to the inflammable nature of the building and materials the flames spread rapidly, and though the fire brigade was on the scene six minutes after the alarm was received they found the central portion of the building one mass of flames. The supply of water from the mains was somewhat inadequate, but this defect was remedied after the lapse of about half an hour. The firemen devoted themselves to keeping the flames from spreading to the adjoining drying and moulding rooms, and in this they were successful. The central portion of the building, however, in which the entire machinery and plant were contained, suffered great damage, the firemen being engaged playing on it for three hours before the flames were subdued. The cause of the outbreak is unknown. The damage to the building, machinery and stock is estimated at 10,000*l.*, and is covered by insurance. About 200 workmen are employed by the firm.

AT the meeting of the Wolverhampton Board of Guardians a report from the assessor and the new workhouse committee was read with regard to the selection of plans by the assessor for the new workhouse. The decision of the assessor as to the merits of the plans sent in for the new workhouse is as follows. He considers the best plans sent in are those of Messrs. Marshall & Taylor, of Nottingham, who estimate the total cost at 129,673*l.* The next three best plans submitted are those of Mr. M. Johnson, Wolverhampton, and Messrs. Mangnall & Littlewoods, Manchester (joint plans), 119,740*l.*; Messrs. Mangnall and Littlewoods and Mr. M. Johnson (joint plans), 126,000*l.*; and Mr. W. Doubleday, Birmingham, 100,000*l.* In all probability the designers of the three last-named sets of plans will each be awarded 100*l.*, as stipulated in the advertisement. The other two plans sent in were by Mr. R. E. W. Berrington, Wolverhampton, with an estimated cost of 90,000*l.*, and Mr. F. T. Beck, Wolverhampton, 126,000*l.*

THE old Nag's Head inn, at Jedburgh, which is being taken down to supply a site for the new public library, is the building in which, tradition says, Robert Burns was presented with the freedom of the royal burgh. In the diary of his border tour, Burns, writing of his stay in Jedburgh, says :—"Was waited on by the magistrates and presented with the freedom of the

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing ; Samples, Prices, &c. re Sheet Asphalte, free.

OLD FORD, BOW, LONDON, E.
Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.

burgh." This was in May 1787. There is no corresponding entry in the burgh records, but recently the ticket of another burgess, an undoubtedly authentic document, granted about the same period, was discovered, and a search of the records showed that this also was not entered there, so that those who were fain to believe that Burns was a burgess of Jedburgh are now satisfied of the accuracy of the poet's statement. In dismantling the principal room of the inn a series of paintings were discovered on the plaster near the fireplace. They are six in number, some of them highly coloured views of mansions and woodland. It is suggested that this may have been the work of French army officers, who were prisoners in Jedburgh in the early part of the century. These prisoners were allowed on parole freedom of movement within certain boundaries, and there are several relics of their stay in Jedburgh—one of them a painting of Jedburgh Abbey, which is highly prized by its possessor. The paintings in the old inn are evidently the work of amateur artists, but that fact really gives support to the view that the soldiers may have sought to relieve the tedium of their enforced stay in the border burgh by reproducing from memory the home scenes to which they were longing to get back.

THE CROWN THEATRE, PECKHAM.

THE new theatre which opened its doors to the public for the first time on Monday evening is one of which Peckham may be justly proud. It certainly takes a place in the first rank of the now numerous theatres of Suburbia, and can indeed hold its own in comparison with the majority of those within the charmed circle of the West End. The exterior is designed in Spanish Renaissance. The material used is terra-cotta and red brick. The site covers an area of 14,000 square feet, and with a view to spectacular productions, which are to be made a specialty, the stage has been placed from west to east, so as to give the greatest possible width, the main entrance occupying the western corner, and the auditorium wall abutting on the main thoroughfare. The prevailing scheme of colour adopted in the decoration of the elegant interior, which will accommodate 2,500 persons, graduates from deep blue to neutral green, with old rose draperies and upholstery. The box and circle fronts are picked out in ivory and gold and modelled in low relief. The crush-room is panelled in oak with mosaic floor, the saloons are decorated with antique Flemish carved oak wainscot, and the foyer is treated in modern Renaissance style. The auditorium ceiling, painted by Mr. Charles Buchel, is extremely effective, the decorative treatment being emblematical of our Queen-Empress and her dominions. In four panels the Colonies—India, Africa, Australia and Canada surrounding "the sun which never sets"—are depicted with cupids holding the crown over each, the remaining panels representing Art, Poetry, Music and the Drama. Over the marble and modelled plaster proscenium—the width of which is 62 feet and the depth 58 feet—is an attractive painted frieze by the same artist, 37 feet in length, representing "Peaceful Britannia," with Music, Poetry, Literature, Art, Science, &c., on either side. The mural decoration consists of a wall-paper, specially designed by Mr. Albert Breden, having the "crown" intertwined with a flowing design. The handsome fronts of the private boxes also help the decorative effect, being rich and imposing in design. The arrangement of the seating is perfect, and insures to every visitor an absolutely unimpeded view of the stage, which is of large dimensions, being 138 feet across and 40 feet deep, and the grid is 62 feet above the stage level. The mechanical appliances are thoroughly up to date. The house is lighted throughout by electricity. The tiers and staircases are of fireproof material, and there are no fewer than twelve exits. Adequate ventilation is secured by exhaust fans, and for warming the entire building there is an adequate low-pressure system with radiators. The theatre, which was designed by Mr. Ernest Runtz, of Walbrook, has been built by Messrs. Coles & Son, of Camberwell, just within the twelvemonth.

NORTHERN ARCHITECTURAL ASSOCIATION.

A LARGE number of members of the above Association paid a visit on the 22nd ult. to Messrs. R. Robinson & Co.'s new premises now in course of erection in Clavering Place, Newcastle. The building, which is an extension of the fine premises erected ten years ago after the great fire by which the old works were completely destroyed, will when completed just about double the size of the firm's works, and will be the largest printing and binding establishment in the North of England. The visitors were shown over the works by Mr. F. W. Rich, the architect in charge. Amongst the company were Messrs. J. Oswald, William Glover, Joseph Kirkett, A. B. Plummer (secretary), H. G. Badenoch, C. E. Herring, R. Burns Dick, Bruce and others. There were also with the party a number of students. The contractors in connection with the work are Mr. John Ferguson, brick and cement-work; Mr. Hewitson,

MACKIE'S PATENT "DEFIANCE" HYDRAULIC WATERTIGHT FLOOR SPRING AND CHECK.

Size of Plate, 12 × 8 in.
Size of Box, 10¾ × 6 × 3½ in.

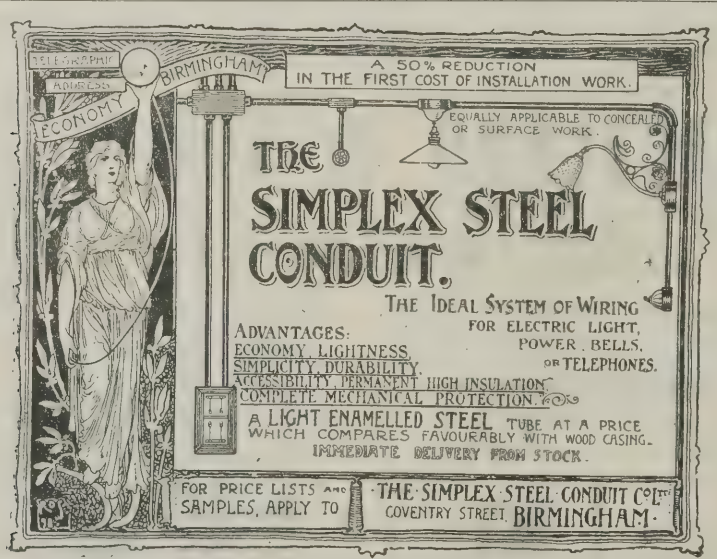
906 80/-
With top centre and brass shoe any size.

This Floor Spring is suitable for any sized door, and can be regulated to suit any force required.

The box is watertight and weatherproof, a distinct advantage when fixed in Banks, Board Schools, Libraries, and similar places, where the floors are frequently washed down.

It is also sent complete with an outer box to fix into floor, to facilitate the spring being taken out when necessary.

Working Models of these and other Specialties may be seen at our newly-fitted London Showrooms, 57 HOLBORN VIADUCT E.C.
Architects and Buyers are respectfully invited to inspect same.



slating; Mr. Mansfield Gibson, plumbing; Mr. William Ferguson, plastering; and Mr. Laidler, painting. Great difficulty and cost were incurred in finding a proper foundation for so heavy a building, particularly as the site is on the steep bank side overlooking the Close. The foundations were carried down about 30 feet, and the ground for over two-thirds of that depth was found to be nothing but loose débris of all kinds, accumulated there for ages. The outer wall or shell of the building is of neat brickwork, with buttresses tapering off with each storey. There are five floors, forming rooms which represent the whole width of the structure. The floorings and supports are a network of steel pillars, joists and girders, all rivetted together, and to this fabric the walls are tied at intervals. Above the joists the floorings are of strong wood. An excellent feature of the building is its ample lighting. Each storey has windows all along the east, south and west sides. On the north side the new building is joined on to the old one. As a safeguard against fire the "Grinnell" automatic sprinkler will be fitted throughout the establishment, and a special water tower is being built up to the main building.

SCOTTISH BUILDING TRADES FEDERATION.

THE fourth annual meeting of the Federation was held in Edinburgh on the 27th ult., Mr. J. B. Hay, builder, Dundee, president, in the chair. Representatives were present from all parts of the country. The report of the executive, which was submitted by the secretary, Mr. James L. Selkirk, C.A., Glasgow, set forth the principal matters which had engaged their attention during the year. These included the formation of branches of employers in various towns not already organised, the starting of a monthly trade organ called the *Federation News*, the first number of which had just been issued; the forming of a federation insurance company, and the initiating of a special fund to meet important emergencies that may arise from time to time. A general expression of opinion was elicited on these various questions, and so far as was necessary, remits were made to the executive thereanent. The progress of the Federation during the year was regarded as most encouraging, and an earnest desire was expressed that many additional towns and districts would be organised during the next year. Thereafter members of executive were elected in room of those retiring with Mr. James Leslie, contractor, Aberdeen, as president; Messrs. T. Kay, wright, Glasgow, and Alexander Beveridge, builder, Perth, vice-presidents, and Mr. James L. Selkirk, C.A., Glasgow, secretary and treasurer.

THE SUPERANNUATION OF MUNICIPAL OFFICERS.

A CONFERENCE of municipal officers, convened by the Municipal Officers' Association, was held on Monday at Sion College, Victoria Embankment. Mr. C. W. Tagg (vestry clerk, Camberwell) occupied the chair, and explained that they had met to consider what steps should be taken to get their Superannuation Bill through Parliament next session. It had been objected that this would place another burden on the ratepayers. He contended, however, that it was a measure of justice to be equally shared between the officer and the ratepayer. The Poor Law Officers' Superannuation Act had now been in force six months, and for that period showed a balance in favour of the ratepayer of 15,000*l*. The salary of municipal officers throughout the country averaged a little over 100*l*. per annum, and out of that sum it was impossible for them to provide enough to retire on. He regretted that the local authorities did not support their Bill to a greater extent. In his opinion the superannuation allowance they asked for was a reasonable one; moreover, it was not a question of a pension but of deferred pay. Mr. Matthew Hale moved and Dr. Dudfield (medical officer, Paddington) seconded a resolution pledging the meeting to do all in its power to secure the passing of the Local Authorities Officers' Superannuation Bill in the next Session of Parliament. Mr. Lowles, M.P., in supporting it, said he would do all he could in the House of Commons to support the Bill to be reintroduced by the Association. He did not think municipal officers should be left to shift for themselves in their old age unless they were paid a higher stipend in their earlier years. It was because he wished to keep our municipal life pure and the officers free from corruption that he advocated their being treated in as handsome a manner as possible and all their reasonable claims satisfied. Mr. Halsey (chairman of the Surrey County Council) and Mr. Rutherglen (clerk to the Kensington Guardians) also spoke in favour of the resolution, which was carried unanimously after a few more remarks from the chairman, who emphasised the importance of securing for the Bill the support of the local authorities. A resolution was

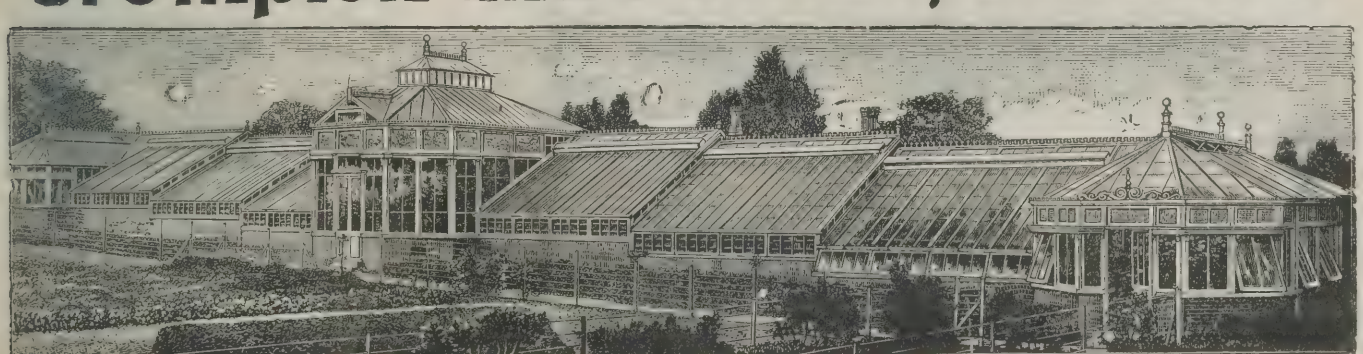
subsequently passed, on the motion of Mr. F. Cliffe, advocating that the Superannuation Bill, when next introduced into Parliament, should also be extended so as to apply to Scotland.

LONDON WATER SUPPLY.

In connection with the proposals of the water committee of the London County Council to ask Parliament for powers to buy the undertakings of the metropolitan water companies and to bring an additional supply of water to London from Wales, a special report has been prepared by the finance committee dealing with the financial bearing of the scheme. In this report, which is signed by Lord Welby, the committee state that they are not in a position to make for themselves an estimate of the expenditure involved by these proposals. They point out that the subjects of purchase and of additional supply had been discussed at length before Lord Llandaff's Commission and in the reports of expert officers of the Council, and they did not think that fresh investigations on their part would add materially to the information before the Council or would justify them in asking for further time to make their report. Indeed, the data for framing a trustworthy estimate of the cost of purchase did not exist, and they would not put forward calculations based upon assumptions for which they had not a warrant. There were, however, figures which represented facts, and upon which therefore reliance could be placed. The net income of the companies, after payment of prior liens, was an ascertained fact, and the comptroller to the Council estimated, in evidence before Lord Llandaff's Commission, that the purchasing authority would in 1901-2 enjoy a net income of 1,030,000*l*. That estimate assumed a progress in gross profits during the five years from 1896-97 corresponding to that which obtained during the preceding seven years. It assumed also that the water rates would continue to be levied as at present. The committee thought the comptroller had in this calculation proceeded upon a sound financial basis, and that the Council might bear the figure 1,030,000*l*. in mind when discussing the proposals of the water committee. Lord Llandaff asked what was the amount of capital the interest and sinking fund on which could be met by a net income of 1,030,000*l*. That also was a matter of simple calculation dependent on rate of interest and term of redemption. By these data the Council might measure to some extent the financial result which might follow from purchase.



With reference to the question of additional supply, the committee point out that this matter raised a different financial issue. It was admitted that, under any circumstances, the safety of London required a large outlay in order to secure a supply which, within a comparatively short time, would be a necessity. The outlay involved would earn no immediate income, and it must be incurred either in providing storage in the Thames Valley, or in bringing water from a new source. It was, therefore, a question whether fresh outlay could be avoided. On that point all parties were agreed, and it was a question which of two costly schemes would best attain the end in view. The storage scheme might cost a sum not very much less than that of bringing water from Wales. Even if the outlay on storage were considerably less than on the Welsh supply, it must be borne in mind that before long the Thames might not suffice for the wants of Greater London. In that event a new supply must be sought, and a scheme less costly in the outset might cost more in the end.

With regard to the only important matter remaining—namely, the term within which the water debt should be redeemed—the committee point out that Parliament does not permit the term of redemption for metropolitan loans to exceed sixty years, and in the case of ordinary loan services the committee think this reasonable, for the ratepayers of the future would have their own pressing needs, and the charge of a sinking fund spread over sixty years was not excessive in the case of ordinary improvements and ordinary works. The purchase of the water companies' interests was, however, an acquisition made once and for ever, and if, in addition, the present ratepayer undertook a charge for which he got no immediate return in order to secure a lasting supply of water for future generations—if, in fact, he secured his successors against the calamity of water famine—the burden should, at all events, be made as light as possible. The committee had therefore no hesitation in recommending that the period of redemption, both for purchase and additional supply, should be fixed at 100 years.

On Tuesday the following recommendations were approved at the meeting of the London County Council:—"That a Bill be promoted in the coming session of Parliament for the purchase by the Council of the undertakings of the eight metropolitan water companies by agreement or, failing agreement, by compulsion. That, subject to such provision as may be made by Parliament as to the ultimate authority or authorities, provision be made for the undertakings of the companies vest-

ing in the Council at a date not later than six months after the passing of the Act. That the Bill contain provisions authorising the Council to proceed forthwith with the connecting and laying of mains and other works necessary in order to enable it to protect any part of the Metropolis from want of water. That the arbitration clause be so framed as to render it certain that in the case of each company the arbitrator will have regard to all such circumstances as may be brought before him, and that no allowance shall be made in respect of compulsory sale except for cost of reinvestment (if any). That, subject to further negotiation thereon with the local authorities, the clauses with respect to the supply of outside areas should follow the principle of the Bills promoted by the Council in 1895. That the understanding with the Corporation of the City of London with regard to their representation on the water committee be adhered to if they so desire. That a Bill (or Bills) be promoted in the coming session of Parliament for the purpose of empowering the Council to bring an additional supply of water to London from the watersheds of the Wye and Towy on the general lines of the report of the water committee approved by the Council April 21, 1896, in so far as it applies to the Wye section of the engineer's scheme. That it be referred to the parliamentary committee to prepare and present to the Council the necessary Bills for carrying out the above resolutions."

REBUILDING KEW BRIDGE.

A MEETING of the Middlesex County Council was held on the 27th ult., when the finance committee, on behalf of the joint committee of Surrey and Middlesex, presented supplementary estimates to the extent of 35,000*l.* for the rebuilding of Kew Bridge. The report of the joint committee showed that while the estimate of the total cost of the widening given by their engineer, Sir J. Wolfe Barry, was 118,000*l.*, the lowest of seven tenders received for the work, that of Mr. Easton Gibb, of Skipton, Yorkshire, was 169,288*l.* 14*s.* 6*d.* In reply to a request for an explanation, Sir J. Wolfe Barry reported that his estimate was based on the prices paid for similar work at the Tower Bridge, with a considerable addition. He suggested that the cost of all work in the neighbourhood of London had been steadily increasing during the past two years owing to the obligations imposed by the Employers' Liability Act, the action of the London County Council with regard to the terms of labour, and the great demand for materials at the present time. He estimated that 20,000*l.* to 25,000*l.* might be saved by the substitution of internal brickwork or concrete for stonework. The committee further reported that they had ascertained that a reduction of about 20,000*l.* might be made on Mr. Gibb's contract in the way suggested, and they recommended that the tender should be accepted for a sum not exceeding 150,000*l.*, and that a Bill be promoted to authorise the additional borrowing.

Alderman Burt moved a resolution to the effect that the County Council "do not entertain the additional expense of 35,000*l.* necessary in order to proceed with the work, and that the report be referred back for reconsideration with a view to bringing the cost within the amount authorised by Parliament." He said the circumstances disclosed by the report were of the most extraordinary character. The estimate was 118,000*l.*, but out of eight tenders received the lowest was 169,288*l.* 14*s.* 6*d.* It showed that a grave blunder had taken place somewhere. He would strongly object to the County Council going to Parliament again to promote another Bill. In his opinion that course would intensify the waste of money which had already taken place. He was advised that the estimate could be cut down, and that a temporary bridge was not necessary.

The Chairman said he was sorry that he was chairman of this joint committee. He felt from the first that the cost would be more than the estimate, and he was anxious that the Council should wait until they got a contribution from the London County Council towards the cost of the bridge, which he thought they should have.

Alderman Burt's motion was carried by thirty-two votes to eight.

THE EXTENSION OF VICTORIA STATION.

A SCHEME for very large extensions at Victoria Station is now, says the *Standard*, under consideration of the Boards of the Chatham and the Brighton Companies. The Brighton Company has during the past three or four years laid down a new up-line, in order to improve the access to the station, but up to the present this has had little effect in relieving the block caused by the enormously increasing traffic. The Chatham Company, in like manner, finds itself very much inconvenienced by the limited accommodation for its growing requirements—requirements which are likely to be increased very rapidly by

the new arrangement with the South-Eastern, which will make Victoria an even more important station than it has hitherto been. The advisers of the two companies have, therefore, hit upon a bold expedient, the effect of which will be to make Victoria one of the largest of the railway stations of the Metropolis. The idea at present is to develop the Brighton Station by including in it a good portion, practically the whole, of the area of the present Chatham Station, and for the Chatham Company to build a new annexe to its present terminus by stretching out to the south. This would involve the absorption of Hugh Street, and the extension of the lines of railway very nearly to the confines of Eccleston Square. Then it is suggested that the stations should be brought forward into the Vauxhall Bridge Road, and the scheme now before the directors involves the acquisition of all the property between Wilton Road and the Vauxhall Bridge Road, and the closing of Wilton Road, as well as the acquisition of the property up to Gillingham Street. Victoria Station reaching into the Vauxhall Bridge Road, with a large courtyard front for both the Brighton and the Chatham Companies, would be a worthy addition to the railway depôts of London, and if a corresponding extension were made of the lines of metals leading into the station, as the present scheme contemplates, none of the inconvenience at present felt of getting into and out of Victoria need be experienced. It is quite possible that this scheme, or at all events a considerable portion of it, will be included in the Parliamentary applications for the present year.

ORDERS FROM SANITARY INSPECTORS.

THE judgment in the case North and Millhouse *v.* Walthamstow Urban District Council, which was heard by Mr. Justice Channell without a jury, is a further confirmation of the responsibility of local authorities for the action of their officers. The action was brought by Miss Sarah Ellen North, of 12 Cawley Road, South Hackney, and Mr. Charles Millhouse, of 13 Cassland Road, South Hackney, against the Walthamstow Urban District Council to recover the sum of 35*l.* for work and labour done and materials supplied as a builder by the plaintiff Charles Millhouse to the plaintiff Sarah Ellen North at the direction of the defendants. The facts were as follows:—The plaintiff Miss North is the owner of seven houses, 22 to 34 (even numbers) Cambridge Road, Walthamstow. The plaintiff Mr. Millhouse, throughout the matters which led to the present action, acted as Miss North's agent and builder. At the end of November 1897 the sanitary inspector for the district complained of the state of the drain of No. 22 Cambridge Road, and served a notice in respect of that house in the form set out below. The ground was opened, when it was discovered that the drain drained more than one house. Subsequently the following notice was served on the plaintiffs in respect of all the houses 22 to 34 Cambridge Road. Both the above-mentioned notices were in the following form, the first being limited to No. 22:—"Walthamstow Urban District Council. To Mr. Millhouse, of 13 Cassland Road. Notice is hereby given you to abate a nuisance at 22, 24, 26, 28, 30, 32 and 34 Cambridge Road, arising from defective drains, within seven days from the service of this notice, and for that purpose to take up and relay properly trap, ventilate and provide means of access to drains. Dated November 27, 1897. Signature of officer of local authority, W. W. West, inspector of nuisances." The work was done in accordance with the notices and according to the instructions of the sanitary inspector as the work went on. The plaintiff Mr. Millhouse admitted that he believed that the pipe to which the repairs were done was a sewer, but he said that he believed he was obliged to do it after he received the notice. It was agreed by both sides that the pipe upon which the work was done was in fact a sewer.

Mr. Macmorran, Q.C. (Mr. Naldrett with him), for the defendants, said that the notice was not given by the local authority at all, but by the sanitary officer upon his own responsibility. He cited Selfe *v.* Hove Commissioners (1895, 1 Q.B. 685), and submitted that the whole of section 104 of the Public Health Act, 1875, applied to expenses incurred by the local authority, and not to those incurred by any other party. Even a statutory notice was not in the nature of an order. These were notices under section 91 of the Act of 1875. The plaintiffs were not in any sense liable to do the work, and therefore could not be said to be legally compellable to do it.

Mr. Justice Channell: Selfe *v.* Hove Commissioners was about as unsatisfactory a decision as ever came into Court.

Mr. Macmorran, Q.C., continuing, said that the notices were not served in consequence of any resolution by or instructions from the local authority. If such a notice was not complied with a statutory notice was issued. The notices were no doubt printed by the Council, supplied to the inspector, and served by him in the course of his duty. Gebhardt *v.* Saunders (1892, 2 Q.B. 452) was also referred to.

Mr. Firminger, for the plaintiffs, cited Andrew *v.* St. Olave's Board of Works (1898, 1 Q.B. 775), the Public Health Act, 1875 (38 & 39 Vict. cap. 55, sections 41, 94 and 104). The plaintiffs, he contended, had been compelled to do work which the defendants were legally compellable to do. This was a notice from which a request to do the work was implied. Selfe *v.* Hove Commissioners was distinguishable. The observations of Mr. Justice Wills were not necessary for the determination of the point before the Court.

Mr. Justice Channell, in the course of his judgment, according to the *Times*, said:—In my opinion I ought to act upon the authority of the decision in Andrew *v.* St. Olave's Board of Works. I do not think it desirable to draw refined distinctions, and, further, I am inclined to think that Andrew *v.* St. Olave's Board of Works involves the same principles as the present case. Upon behalf of the defendants it was said that that case was distinguishable and inconsistent with Selfe *v.* Hove Commissioners. That case is no doubt not an entirely satisfactory decision, but it is not necessary to discuss it further, as the present case is not governed by it. Upon behalf of the defendants it was conceded that the sections in the Public Health (London) Act, 1891 (54 & 55 Vict. cap. 76), upon which Andrew *v.* St. Olave's Board of Works was decided, were similar to the corresponding provisions in the Public Health Act, 1875. In that case the work had to be done at once; in the present case that is not so. It is admitted that it was the duty of the defendants to do the work. If any persons other than the plaintiffs had done the work it would have been a voluntary act, and they could not have recovered the cost of it from the defendants. The principle upon which the cost of doing the work is sought to be recovered by the plaintiffs in the present action is that if a person is compelled to do that which another person is legally liable to do a request is implied by the person who is so liable. The question is, What degree of compulsion is necessary to entitle the plaintiffs to recover? The compulsion need not be irresistible. It is not sufficient for the defendants to say that if the plaintiffs went before the magistrate they would have had a defence. If a public body comes to a person and either commences or threatens proceedings such a person is no longer a volunteer. A person in such a position is under an obligation to do the work. It is immaterial whether the notice given to the plaintiffs was a statutory notice or not. The law implies practical compulsion. In the present case there was no legal compulsion, but a more indirect compulsion is sufficient. It has been held in betting cases that a mere threat to turn a man out of a club is sufficient to enable him to recover money paid by him to avoid being turned out. Where a man repaired a sea wall as a matter of practical necessity which it was the duty of the commissioners to repair he recovered the costs of the repairs. The fact that in the present case there was no actual statutory notice is immaterial.

Judgment for plaintiffs, with costs on High Court scale.

PATENTS.

THE WEEK.

THE anomalies of the law in regard to sewers and drains were explained by Mr. A. MACMORRAN, Q.C., in a paper read at the opening meeting of the Auctioneers' Institute on Tuesday. Under the Public Health Act, 1875, a drain, he said, might be said to consist of a channel for the conveyance of drainage or sewage from buildings within the same curtilage or enclosure in which a house stood. If a drain from neighbouring premises were let into it this channel would become a sewer. The duty of repairing a drain was upon the owner or occupier of the premises drained; a sewer, on the other hand, was vested in the local authority. It was a curious fact that while a local authority had ample power over private persons with reference to the making of drains from private houses, they had little or none in respect of the making of sewers except under private streets. To the general rule that a sewer became vested in a district council there were three statutory exceptions—sewers made by a person or company for profit, sewers for land drainage or irrigation under a local Act and sewers under the authority of Commissioners of Sewers. Where persons were damaged by floods caused by insufficiency of sewers and no negligence could be shown on the part of the local authority, they had no remedy, and could only complain to the Local Government Board. In the discussion which followed a general opinion was expressed in favour of amendment and codification of the law in relation to drainage.

ON Tuesday an important judgment was delivered in Leeds by Dr. TRISTRAM as Chancellor of the diocese of Ripon. The Vicar of Christ Church, Meadow Lane, with the churchwardens, applied for a confirmatory faculty for the twenty pictures and frescoes in the church, as well as a faculty to remove others, including that of *St. Veronica*, from the church altogether, substituting others in their stead. About ninety parishioners opposed the applications, urging that the use of pictures representing the stations of the Cross, &c., was irregular or illegal in the Church of England. Fourteen of the pictures represented the stations of the Cross and four frescoes had been painted on the walls. A picture of the Saviour nailed to the Cross was suspended on the back of the pulpit without the sanction of a faculty. The case for the objectors was supported by CLIFTON *v.* RIDSDALE, in which Lord PENZANCE on ordering the removal of pictures held that the three falls of CHRIST and the legend of St. VERONICA had no warrant in gospel history, and that the pictures were neither architectural decorations nor of a lawful character, Dr. TRISTRAM said that one objection to granting a faculty for the retention of the eight stations of the Cross was that they were in use in the Church of Rome at the present day for purposes of devotion of a nature not permissible in the Church of England; it had been further pointed out that the stations of the Cross had been introduced into St. Mark's, Marylebone, in the diocese of London, without a faculty and removed under a faculty. The Chancellor pointed out that in the present case before him, according to the evidence, on a certain Sunday morning at a harvest festival a lady, who was a stranger, on entering the church, walked down the north aisle, stopped and bowed and made obeisance before each of the stations as she passed them. The court, therefore, he said, was not in a position to sanction the retention of the stations, though reduced in number, without risk of their being used in the church some time or other superstitiously. He ordered the removal from the church of all the stations of the Cross and the picture suspended behind the pulpit. As these pictures and frescoes had been introduced in the church without a faculty, the cost incident to the issue of a confirmatory faculty was to be payable by the petitioners.

ON Tuesday a course of six lectures on "The Architecture of the Renaissance in France" was commenced by Mr. W. J. ANDERSON, at the Glasgow School of Art. The period comprised works of 1475-1520. The illustrations of Pierrefonds, Gaillon, Azay-le-Rideau, &c., enabled the students to follow the unfolding of the château style out of the defensive machine of the fortified castle. The development of the town house of the nobles, brought about by similar causes, such as the greater security of the country, was treated, and the variations which the change in the conditions, and especially the larger field open to the designer, induced in the details. For with the consolidation of the kingly power in France, the architect, too, comes into his inheritance. On the part of the workmen, co-operation with the master craftsmen in the making of a perfect whole is the ideal substitute for the Mediæval one of rivalry with one another in the details of a subordinate part. In conclusion, Mr. ANDERSON said that in these studies the aim was not artistic reproduction or the opening up of new opportunities of imitation, but that we might better understand such developments and have our ideals raised to a loftier plane—especially that the lesson might be learned that architectural growth comes of acceptance of new conditions of life, of the new purposes which architecture is privileged to serve.

DURING the present session of the Liverpool Architectural Society the following papers will be read:—"Liberalism and Conservatism in Architecture," by Mr. EDMUND RATHBONE; "Early Italian Renaissance Sculptors and their Work," by Mr. WILLIAM H. THORP; "Saracenic Architecture," with limelight illustrations, by Mr. TALBOT KELLY; "Enamels," by Mr. ROBERT HILTON; "Ideals and Realities of Modern Practice," by Mr. E. PRIOLEAU WARREN; "Some Burgundian Churches," by Professor SIMPSON; paper by Mr. EDWARD S. PRIOR, M.A.; "Notes on American Architecture," by Mr. H. BLOOMFIELD BARE, F.R.I.B.A.; "New York Office Buildings," by Mr. JAMES H. COOK; "A Description of the New Royal Insurance Buildings," by Mr. J. F. DOYLE; annual general meeting and closing address by the president, Mr. W. E. WILLINK, M.A., A.R.I.B.A.

THE opening address of the Society of Arts' one hundred and forty-fifth session will be delivered on Wednesday next, the 16th inst., by Sir JOHN WOLFE BARRY, K.C.B., LL.D., F.R.S., the chairman of council. The topic which he proposes to deal with is the internal traffic of London. The following papers will be read at the meetings before Christmas:—"Long Distance Transmission of Electric Power," by Professor GEORGE FORBES, F.R.S.; "Photographic Developers and Development," by C. H. BOTHAMLEY, F.C.S.; "Egypt and the Soudan in 1897 and 1898," by W. T. MAUDE; "Commercial Education," by Sir ALBERT ROLLIT, LL.D., M.P. For meetings after Christmas:—"Electric Traction and its Application to Railway Work," by PHILIP DAWSON; "Canals and Inland Navigation in the United Kingdom," by L. F. VERNON-HARCOURT, M.A.; "Preservation of Timber," by S. B. BOULTON; "Coal Supplies," by T. FOSTER BROWN; "Wireless Telegraphy," by W. H. PREECE, C.B., F.R.S.; "Leadless Glazes," by WILTON P. RIX; "Tuberculosis in Animals," by W. HUNTING. The meetings of the Applied Art Section will be held on January 31, February 21, March 14, April 18, May 2 and 30, 1899.

EVERY visitor to St. Sulpice in Paris will remember the two big shells which confront him on entering. They are mounted on marble stands, and along the edge of each is an ormulu band which keeps it from decay. The shells have served as fonts for a great many years, and appear as if they would endure for a still longer period. A similar shell was lately brought from the Philippine Islands by Mr. WILLIAM WILLOX, which he presented to the new church of All Saints, South Merstham. It has been mounted as a font, which is unlike any others in England. But a font does not subserve the same purpose in Paris and in South Merstham, and the newest employment of the *Tridacna gigas* may not be successful.

SCOTT ON THE ARCHITECTURAL GARDEN.

THE author of "Waverley" possessed many of the qualifications which are desirable in anyone who sets himself up for an authority on landscape gardening. As a poet he was a lover of nature, as an archæologist he loved buildings, and he desired that nature should enhance the buildings and vice versâ. But SCOTT also believed he was a shrewd investor and was eager to do all he could to increase the value of any land he purchased. He worked wonders at Abbotsford; whether his planting was always profitable is however doubtful. He enjoyed very great pleasure in his operations, and he was too wise to expect that pleasure can ever be obtained gratuitously.

The principal drawback to SCOTT as an authority was the vastness of his ideas. Feudalism was revived in him, and he wished to look on the world as one of his ancestors would have done. His ideal of happiness for peaceful intervals between warlike raids was that of a hunter, and especially one who, like himself, would be able to value the beauties of landscape. He must have been thinking of himself when he wrote:—"The ancient English poets, CHAUCER and SPENSER in particular, never luxuriate more than when they get into a forest. By the accuracy with which they describe particular trees and from their noticing the different characters of the different species, and the various effects of light and darkness upon the walks and glades of the forest, it is evident that they regarded woodland scenery not merely as associated with their favourite sports, but as having in itself beauties which they could appreciate, though their age was not possessed of the fascinating art of committing them to canvas." A man whose inclinations are towards the forest and the wood, which suggest infinitude, cannot have the fullest enjoyment in a garden, in which it should be a rule of art to have no concealment about the limitations. Sir WALTER SCOTT cheerfully endured many sacrifices in order to create woods around him, but his interest in the gardens was of a less heroic kind.

Still he could say without the least exaggeration and in all sincerity, "Homo sum; humani nihil a me alienum puto." All men dare not aspire to the possession of forest scenery; they were compelled to be content with miniature Edens, and SCOTT endeavoured to sympathise with them. But it was on the understanding that the owners recognised the difference between art and nature, and that art was not suppressed, for "the art itself is nature." The old garden, according to SCOTT, was "an extension of the splendour of the residence into a certain limited portion of the domain—was, in fact, often used as a sort of chapel-of-ease to the apartments within doors." Once admit that conclusion and there can be no difficulty about the character which a garden attached to a house should express. Like the house, it was a creation by human hands with the aid of materials which nature had provided. The garden became, as SCOTT said, "in the highest degree artificial, but it was a sight beautiful in itself—a triumph of human art over the elements, and, connected as these ornamental gardens were with splendid mansions, in the same character, there was a symmetry and harmony betwixt the baronial palace itself and its natural appendages which recommended them to the judgment as well as to the eye. The shrubs themselves were artificial in so far as they were either exotic, or if indigenous were treated in a manner and presented an appearance which was altogether the work of cultivation."

SCOTT'S preference may have been inspired in part by his professional interest as a writer. Flowers can bloom although the owner of the garden is desolate, and there is a sort of picturesqueness about a garden where weeds are asserting a right to share the soil which is not without interest. But defaced sculpture and tottering stonework are always pathetic. SCOTT knew how to avail himself of their aid. Thus the neglect which prevailed at Cumnor Place is at once brought before us when we are informed that "Some statues, which had ornamented the garden in its days of splendour, were now thrown down from their pedestals and broken in pieces, and a large summer-house, having a heavy stone front decorated with carving, representing the life and actions of SAMSON, was in the same dilapidated condition." The few strokes are enough to enable the reader to complete the picture, and the reference to the strong man of the Hebrews makes the ruin more impressive.

Take another example, or rather a pair of them. In Tully Veolan there was less restraint than the English visitor, Captain WAVERLEY, was accustomed to observe in the south. But with a mistress like ROSE BRADWARDINE there could hardly be any disorder about the castle. The terrace was partly paved and bordered with flowers and choice shrubs. There was "a stone parapet with a heavy balustrade, ornamented from span to span with huge grotesque figures of animals seated upon their haunches, among which the favourite bear was repeatedly introduced." In the middle of the terrace was another bear (that animal was the crest of the family) supporting a sundial. The garden was laid out in a series of terraces; the shrubs were cut into grotesque forms, and a brook was made to appear tranquil. All this was undoubtedly artificial, and without continuous care would not present a pleasing appearance to a stranger. When, owing to the troubles of the time, the Baron and his daughter have to abandon the old castle and the place is seized by English troops, the garden and its adornments are made to suffer as if they were Jacobites, and SCOTT introduces a scene of a different kind. We learn that "the accessories of ancient distinction, to which the Baron in the pride of his heart had attached so much importance and veneration, were treated with peculiar contumely. The fountain was demolished. The whole tribe of bears, large and small, experienced little favour; the balustrade was broken down, the walls destroyed," &c. Some apology is due for calling attention to passages by an author whose works are familiar to all, but in SCOTT as in other writers, many descriptions are liable to be skipped by readers who are in haste to reach the conclusion of his story. It may not, therefore, be generally known how closely SCOTT'S practice corresponded with his principles. He was a worshipper of nature, but he knew that under certain conditions nature is enhanced by art, or at least is so in the eyes of healthy men like himself.

SCOTT therefore agrees with UVEDALE PRICE about the striking effect produced by architectural ornaments in a garden, and by raised terraces, fountains, flights of steps, parapets with statues, vases, balustrades, &c. The fact that such productions are surrounded by walls appeared to him to suggest they were distinct from the rest of the domain where more liberty was allowed to nature. But if the artificiality be once admitted then, says SCOTT, "it seems right and congruous that these objects being themselves the offspring of art, should have all the grace of outward form, and their formality is to be varied and disguised."

While admiring artificiality and quaintness, Sir WALTER SCOTT was not disposed to seek from the Dutchmen models of treatment. Strange as it may appear to those who are acquainted with old Scottish examples, he preferred to follow the Italians, and he was right. As LANDOR says, "We Englishmen talk of planting a garden; the modern Italians and the ancient Romans talk of building one—Cui Cneius noster locum ubi hortos *ædificaret* daret." If a garden is to be built the principles of architecture should be respected. SCOTT'S conclusions are marked by his usual good sense. He says:—"If we approve of Palladian architecture, the vases and balustrades of VITRUVIUS, the enriched entablatures and superb stairs of the Italian school of gardening, we must not, on this account, be construed as vindicating the paltry imitation of the Dutch, who clipped yews into monsters of every species and description, and relieved them with the painted wooden figures which are seen much in the attitude of their owners, silent and snugly smoking at the end of the paltry walk of every *Lust-Huys*. The distinction betwixt the Italian and Dutch is obvious. A stone hewn into a gracefully ornamented vase or urn has a value which it did not before possess; a yew hedge clipped into a fortification is only defaced. The one is a production of art, the other a distortion of nature." SCOTT could not have foreseen that in the course of sixty years the buildings of Holland would be imitated throughout England; and when we have adopted the most important part, there is not much use in hesitating over the accessories. A Dutch hedge is undoubtedly to be preferred to the bare walls of inferior brickwork which are to be seen in too many English

gardens, and which, as SCOTT said, make the modern garden resemble a convict in his prison garb, who, by his very appearance, is banished from all decent society.

The system of KENT, which made nature omnipotent and brought it up to the very doors, was an abomination in the eyes of SCOTT. As a lover of antiquity, he could not tolerate arrangements to which had to be sacrificed "many a trophy of old magnificence—courtyard, ornamented enclosure, fosse, avenue, barbican and every external muniment of battled wall and flanking tower, out of the midst of which the ancient mansion, rising high above all its characteristic accompaniments, and seemingly girt round by its appropriate defences, which again circled each other in their different gradations, looked, as it should, the queen and mistress of the surrounding country." CAPABILITY BROWN went beyond KENT, for he was more ambitious. One of BROWN'S pupils created the grounds of Duddingstone, near Edinburgh. He twisted a brook into what SCOTT calls a string of sausages with the aid of a series of dams. Care was taken by him to obscure a view of the historic Craigmillar Castle, because, as he explained, the building from being visible over all the country was a common prostitute. The expression reveals the antipathy which filled the souls of the school of landscapists against everything which could be considered as architectural. It was fortunate that Sir WALTER SCOTT did not agree with them, or enthusiasts might be found to declare that the ideal life was only to be found among the belts, plantations and parterres beneath trees, and not within houses.

CHARLES GLEYRE.

IT might be easily supposed from what was said by many people in England during the recent commotion that M. MARCHAND was the first emissary of civilisation from France who found his way to the Soudan. He was undoubtedly the first who considered he had the right to exclaim, "Veni, vidi, vici!" But during the last sixty or more years several of his countrymen have gazed on the Blue Nile and the White Nile without imagining that by so doing they had acquired the proprietorship of the watershed. The Bahr-el-Ghazal, of which we are compelled to hear so much, was, unless we are mistaken, discovered by BRUN-ROLLET, one of the numerous emigrants from Savoy who have enriched France, but in exploring the region he had no intention of acquiring a territory for his adopted country; he made the voyage simply in order to divert his mind from domestic troubles.

One of the earliest of the travellers who followed the course of the Nile beyond the Nubian desert was CHARLES GLEYRE, the painter, who, like BRUN-ROLLET, was a naturalised Frenchman. His *Illusions Perdues* is a memorial of the journey. It was at one time the most popular of the examples of the modern school with the copyists of the Luxembourg. It is now in the Louvre. The picture is well known from engravings. It represents an antique boat, Egyptian-Greek in build, containing several girls who are singing or harping. Youth is not merely at the prow, but fills the boat, and Cupid, who has a chain of roses round his neck, with one hand uses an oar as a rudder, and with the other lazily drops leaves in the river. The boat is quite close to the bank, on which a wearied poet is seated, his lyre and staff lying on the ground. The figure expresses dejection, for the listless arms seem to be unable to again strike the strings. The river is wide, and the opposite banks are low. Night is approaching; the birds are winging their way homewards, and the new moon with its sharp curves is like an omen of sorrow.

Les Illusions Perdues is of importance in the history of French art, for it is the earliest example of the Neo-Grec school of painting, and as such it will always be valued. It shows a classicism which is neither that of DAVID nor of INGRES. But it has an interest of a different sort. It is simply a boating-scene on the Nile which was transfigured. Originally it bore the commonplace title *Le Soir*, and there was nothing to divert attention from the boat and its passengers. But when the poet was introduced, and they were consequently relegated to the second plane, a new designation was necessary to suggest that his day of renown was over; his songs were antiquated and not adapted for the pleasure parties of the new age :—

> Who would not mourn the minstrel's fate? his life so short and drear,
> And if he win a wreath at last, 'tis but to shade a bier;
> His harp is fed with wasted life—to sighs its numbers flow,
> And strung with chords of broken hearts is dreamland's splendid woe.

"Lost Illusions" was not only an appropriate title for GLEYRE'S early picture; it might have served as the expression of his own experience at the close of life.

CHARLES GLEYRE was one of those artists who are destined to be always seeking for something which is never to be found, to aim after ideals which no brush can represent, to see colours which no earthy materials can express. Men of that class can never count upon success. If by a series of fortunate accidents they are satisfied with an occasional work, it is likely to be beyond the comprehension of the crowd. On the other hand, so much is expected from the artists they cannot expect favour for their ordinary works. GLEYRE knew the consequences of what he proposed to do. Whenever one of his pictures was exhibited he saw it neglected, but he made no attempt to introduce the effects which would secure popularity. He preferred poverty and retirement in a humble studio in the Rue du Bac to wealth and applause. There was something more than quixotic in GLEYRE'S character. One instance will suggest his disinterestedness. When PAUL DELAROCHE found that he must avoid teaching owing to the state of his health, he arranged for GLEYRE to become his successor. The appointment was equivalent to a fortune. But the Swiss painter declined to accept it unless on the understanding that all his instruction was to be gratuitous. For a quarter of a century he gave lessons regularly twice a week without receiving a franc in return. If we remember that throughout the whole period GLEYRE'S income was modest and uncertain, his generosity will appear still more out of keeping with the commercial spirit of the nineteenth century.

His indifference to lucre was shown in many other ways. The *Illusions Perdues*, as we have said, did not represent the original conception of the painter. GLEYRE'S fastidiousness was continually compelling him to supersede whatever he had drawn or painted. For every one of his pictures he made numerous studies, and not a figure was introduced unless it had gone through a laborious evolutionary process. Always seeking after the best, he could not follow beaten tracks. That was the cause of his appearance in the Soudan as early as 1835. He had lived several years in Italy, and made as various a collection of drawings as if he had been employed to prepare illustrations for a history of Italian art. The theory of development was in the air, and GLEYRE considered that by tracing the variations of the schools and the changes which time brought forth he would at length realise what was to be the next phase in his art.

GLEYRE had gained much knowledge, but it did not suffice for him. After exhausting Italy he went to Greece. New horizons opened before him. He turned to Egypt as to the source of art. But there he saw system overruling nature, and he resolved to trace as much as he could of the primitive ways which the Egyptian artists conventionalised. Onwards he travelled until he found himself in Khartoum, which was then the *Ultima Thule* of civilisation, or rather, the boundary between it and barbarism.

Since the Nile Valley has attained importance in the eyes of European politicians so much has been written about it and so many tourists have traversed it, we suppose every British soldier in the late campaign was able to form an elementary notion of its characteristics before he arrived in Egypt. But in the thirties the greater part was an unknown land. GLEYRE busied himself in sketching carefully everything which gave variety to the monotonous expanses of the country. He was amassing enough materials to enable him to paint hundreds of pictures, forming a book of reference that would avail in all possible circumstances, details to serve for a lifetime. It must, however, be stated that the multitude of drawings were of little use to him, and like much else which the artist accumulated they exemplified labour in vain. Many of them exist, and who knows whether they may not be used to support the claim to effective possession of the Soudan?

Khartoum was in those days a centre for slave-dealing, and an immense variety of representatives of African tribes passed through it. GLEYRE made careful studies of them. On one occasion while he was on the quay a boat of captives arrived. One of the women recognised her son among the crowd of spectators, sprang on shore, and seized him. She begged that she might be purchased by his master in order to avoid a new separation, but the slave-dealers were not to be moved by appeals to their pity. It was only another case of lost illusions.

If GLEYRE when he returned to Paris depicted the actual scenes he had witnessed, the novelty of the subjects would have captivated the market. But, for him, all the strange sights were to serve as auxiliaries to his compositions. In his mind consequently there was a conflict of theories. His own experience in Africa qualified him to be a pioneer of realism, while his aspirations were towards the ideal. GLEYRE tried to combine the two, but the days for that sort of eclecticism had passed. He began with Scriptural scenes. His *St. John at Patmos* was such a visionary as he might have encountered in his travels through the desert. The public were shocked by the painter's liberty in substituting a portrait of a strange-looking fanatic for an inspired evangelist. Although HORACE VERNET had attempted Old Testament scenes with some of the peculiarities of the Syria of his time, still the public were not prepared for so matter-of-fact a representation as came from GLEYRE. It did not meet with approval, and consequently the artist lost those commissions for paintings to be hung in churches which he was entitled to expect.

Naturally the disappointment pained him. To a morbidly shy man like GLEYRE, who was moreover in a strange country, a little success was needful at starting in order to encourage him and to prevent a surrender to pessimism. However, he believed that the highest aim of painting was to be found in the adequate representation of scriptural subjects, and he produced another work, consisting of several figures, viz. the *Separation of the Apostles*. But the realism of the *St. John* was avoided. In this work there was more of the ideal, but it was not of the academic variety. There was no question that the painter was progressing in his art. To prove that he was no less competent to treat work of a different class he painted an *Echo*, which was immediately purchased by a German. Its success led to the production of his *Bacchantes*, which was allowed to pass to Madrid. Many critics consider it to be the most successful of the painter's works.

Whatever was the merit of his work, CHARLES GLEYRE discovered that the picture-buying public were not too eager to secure his works before they had left his easel. In the course of time he accepted his fate philosophically. There was no artist in Paris who was more willing to serve his brethren, and FLAUBERT invoked his aid when writing "Salammbô." He found plenty of employment in altering his own works until they became evidence of his peculiar emotions, and although the subjects are often remote enough from the nineteenth century, yet there is a personal note in the majority of them which should enhance their interest hereafter. They suggest the exile. GLEYRE could not conceal from himself that a naturalised Frenchman is not treated in the same manner as one who is born in the country. If he had any doubts on the subject they were dispelled by a misdeed of INGRES. The DUC DE LUYNES had commissioned GLEYRE to paint a series of pictures for the Château Dampierre. Then he invited INGRES to produce another series which would be a continuation of the former, but without any restriction as to independence in treatment. INGRES refused to undertake the work unless GLEYRE's pictures were cleared away. The nobleman consented. NEMESIS, however, seemed to have an eye on the transaction. The duchess expressed dissatisfaction with one of INGRES's nudities, and the despotic artist declined to carry out his commission. Is it any wonder that, after such treatment, CHARLES GLEYRE should become more of a recluse, or that he raised an obstacle to his appearance in public by the shabbiness of his attire and neglect of himself? When at night he walked along the quai at the end of the Rue du Bac he may often have regretted that he did not remain at Khartoum, although he would have to witness many of the iniquities of the slave trade.

NORMAN LONDON.

AS one of a series describing London at various periods, Sir Walter Besant gave a lecture upon London as it appeared in the eleventh and twelfth centuries at Toynbee Hall, Whitechapel, on Saturday evening. The city was enclosed between the Roman wall on the north and the Thames and river wall on the south. Recent discoveries indicated that this river wall was built on a cliff some 10 feet or 20 feet high on the site of the present Thames Street, and its existence enabled the citizens on several occasions to beat off attacks made by the Danes. Outside this wall a foreshore of mud was gradually reclaimed as our Saxon ancestors built quays and wharves for trade purposes, the wall disappeared, and in a number of very narrow streets, many of which still retain their old character, lived the working classes connected with the trade and navigation of the river. When William the Norman took possession London was well populated and divided into 136 parishes, each with its small church, the dedication of which showed Saxon origin, and to overawe the citizens the Conqueror built Baynard's Castle, near Ludgate Hill, and commenced the Tower at the eastern extremity of the wall, with free access to the river. In Cheapside and Eastcheap every kind of craftsman found a market; on the south side by shops, cells or warehouses and stalls, smaller articles being sold around the Cross, and on the north side dwelt the artisans in cottages built for temporary convenience without regard to order or alignment; hence arose a network of winding lanes leading from house to house. In the district extending parallel to Cheapside from Newgate to Portsoken were the houses of the wealthier citizens, and to the north every kind of industry was carried on, for London supplied its own wants. Its imports were mainly fine cloth, spices and wine, and such trade was carried on by foreign ships from Antwerp, Bruges and Ghent. Conveyance by land was by means of pack-horses. The government of London was developed on lines of Saxon institution. William the Conqueror gave a charter to the bishop, and the duties of the reve, or king's officer, were little beyond collecting Customs dues. Each alderman on his own land acted as magistrate, and when any matter required settlement in the common interest the great bell of St. Paul's summoned the people to meet for deliberation. Each guild or trade regulated the price of its produce, and though there was no specific mention of it, a guild of merchants probably regulated the export trade, which consisted largely of wool. From time to time waves of religious enthusiasm swept over the country, and to one of these we owed the foundation of St. Bartholomew's Hospital. The lecturer told the story of how this arose out of the pious vow of Rahere in the early part of the twelfth century, and with many an anecdote illustrating the manners of the time, expressed his view that, though often subjected to the scourge of pestilence, the 120,000 inhabitants of Norman London, with a brisk trade and cheap food, led free, comfortable and happy lives.

HISTORIC SOCIETY OF LANCASHIRE AND CHESHIRE.

THE first meeting of the session of this Society took place on the 3rd inst, Mr. A. M. Robinson presiding over a good attendance of members and friends. The paper of the evening on "The Twelve Sworn Men of Goosnargh" was read by the Rev. E. D. Bannister, the vicar, who, after giving a general description of the neighbourhood, gave a descriptive and historical account of the church, with its furniture and ancient chest containing the parish book. In this volume are written the records of the twelve sworn men elected to look after the affairs of the parish, religious and secular, the taxation and general matters connected with the township. Many amusing stories were given of individuals and quaint country customs, with copious extracts from the vestry book. A brief sketch was given of the old halls of this neighbourhood and the old Lancashire families connected with them. At the close a discussion took place in which the chairman, Mr. E. W. Cox, Mr. W. E. Gregson and others took part, and Mr. Gregson proposed a cordial vote of thanks to the lecturer, which was seconded by Mr. W. Fergusson Irvine, and heartily accorded.

EDINBURGH ARCHITECTURAL SOCIETY.

THE above Society met on the 2nd inst., when Mr. John Kinross, architect, gave his address as hon. president. Mr. P. E. Noble presided. Mr. Kinross confined his remarks to the architecture of the city and suburbs of Edinburgh, and contrasted the munificence of men such as Mr. Usher, Mr. Findlay and Mr. M'Ewan, in beautifying the city by the erection of handsome buildings, with that of the landowning and speculative classes, who were doing their utmost to destroy its amenity. He insisted on wide streets, with ample light, being necessary for the health of the community.

SUMMER HOLIDAYS AMONG FRENCH CATHEDRALS.

By the Author of "Ecclesiologia Germanica," &c.

(*Continued from page* 250.)

I.

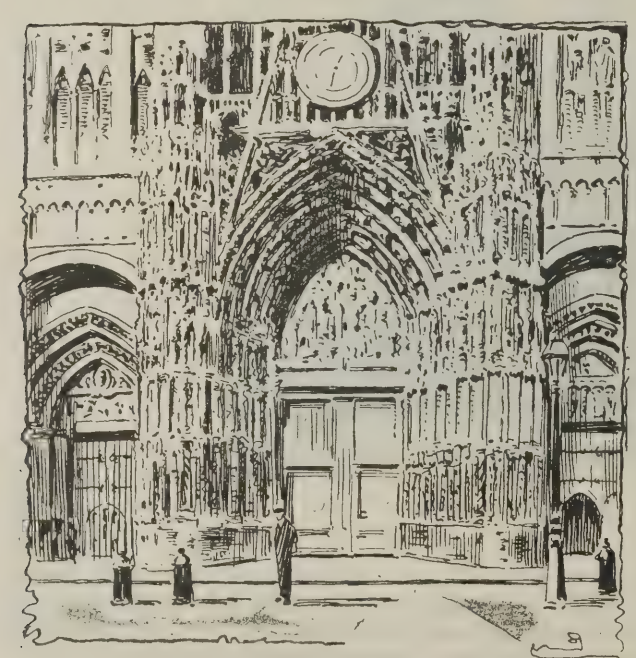
Some Cathedrals and Churches of Normandy.

IT is certainly most agreeable, after a somewhat boisterous channel passage, to find oneself sauntering across the sunny square of Dieppe, and to be presently standing beneath the Flamboyant tower of St. Jacques—one of its two minsterlike churches. The exterior of this building is apparently almost entirely Flamboyant, but a closer inspection will reveal many beautiful details of earlier epochs, only requiring a quiet conservative restoration to bring them out in a more complete manner. St. Jacques is one of those many French churches which, as far as distribution of parts and general arrangements go, would pass with us for cathedrals, including in its ground plan a nave with lofty clerestory, aisles, flanking chapels and nobly proportioned, but apparently—like many another in France—unfinished south-west tower, rich in detail; transepts; and choir, with circumambient aisles, from which projects a well-developed lady chapel with tall transomed windows. The oldest parts of St. Jacques at Dieppe are the transepts and the arcade of the choir and apse, the latter being truly graceful specimens of French thirteenth-century work; their clustering shafts and well-moulded arches are especially deserving of study. The next portion in order of date is the nave arcade, whose pillars are of a form very frequent in France, but rare with us, viz. cylindrical with a slender shaft at each cardinal point, the capitals of each being foliaged. The tall clerestories of both nave and choir are noble features. That of the nave is of a far superior order of Middle Pointed to that of the eastern limb, where a deterioration in style is very palpable. As throughout Normandy, there is a considerable amount of Late Flamboyant and Early Renaissance work about St. Jacques, chiefly in the side chapels, where quaint features are the models of ships suspended as votive offerings, and a quantity of mediocre painted glass very similar in drawing and tincture to that which Wailes used to place in Middle and Third Pointed churches at home, when not under the superintendence of an architect, or when it did not call for or secure peculiar exertions on his part.

This period of French Pointed may not inaptly be termed its autumn. Every delicate shoot has thrust its furthest, every leaf has become puckered and every flower has fruited. All the splendour which precedes decay characterises the Flamboyant of France. It possesses none of the strength, vigour, or nerve of our English Perpendicular, but it is the perfection of *abandon*—light, frivolous, marvellously beautiful; in a word, thoroughly French.

One of the most curious and striking features of St. Jacques at Dieppe is found in a chapel at the west end of the south aisle, from which it is separated by an elaborate Late Gothic screen, viz. a group of statuary representing the entombment. Our Lord is being placed in the sepulchre by Nicodemus and St. Joseph of Arimathea, and on the inner side of the tomb are the Holy Women and St. John the Evangelist, who supports the drooping figure of the Virgin. The effigies are about life-size, and by the light of some tapers placed by the faithful along the cresting of a low grille, this solemn group has a truly weird effect to the spectator who comes upon it for the first time. Its date is 1612—so says Noel, a French author writing in 1795—and it was executed at the expense of a pious traveller who returned from the Holy Land. This may be correct when it is borne in mind how accurately the work of better and purer epochs was reproduced in France at a period long posterior to the extinction of the Pointed styles, but we should have assigned it to a date at least half a century earlier.

St. Jacques abounds in charming bits for the artist in the shape of Early Renaissance screens to the chapels opening from the processional aisle; indeed, the whole interior to those visiting France for the first time is a perfect revelation, and picturesque "views across" present themselves very frequently to the visitor. Dieppe possesses another church, generally overlooked by the savants and bookmakers, but whose interior, almost unchanged since the days of Wild* and Coney, must always please the artist more than the air of Parisian smartness that pervades St. Jacques—I mean St. Remi, with its three grandiose Renaissance façades and its pewed, heavy-pillared, Flemish-looking interior.



West Front of St. Remi, Dieppe.

Like St. Jacques, St. Remi is cruciform, but of very Late Gothic. The choir was finished in 1545, but owing to the religious wars the nave was not completed until the seventeenth century was far advanced. Three fine fronts in the Louis XIV. style contain the entrances, the western façade being of especial elegance. The choir of three bays has ponderous cylindrical piers, very tall, with coarsely foliaged caps and arches very narrow and stilted. The arcades are so high as to admit of no clerestory to speak of. There is some rich stained-glass in the apse clerestory with figures of bishops. The choir aisles open into chapels by very simple arches on piers without caps or bases, and of a type common in Late French Gothic. These

* A drawing of the choir of St. Remi at Dieppe, with those accessories for which Wild had such a penchant, and which he introduced with invariable success, will be found in his posthumously published "Architectural Grandeur of Belgium, Germany and France"—a series of marvellously delicate outline pictures, and valuable in point of detail.

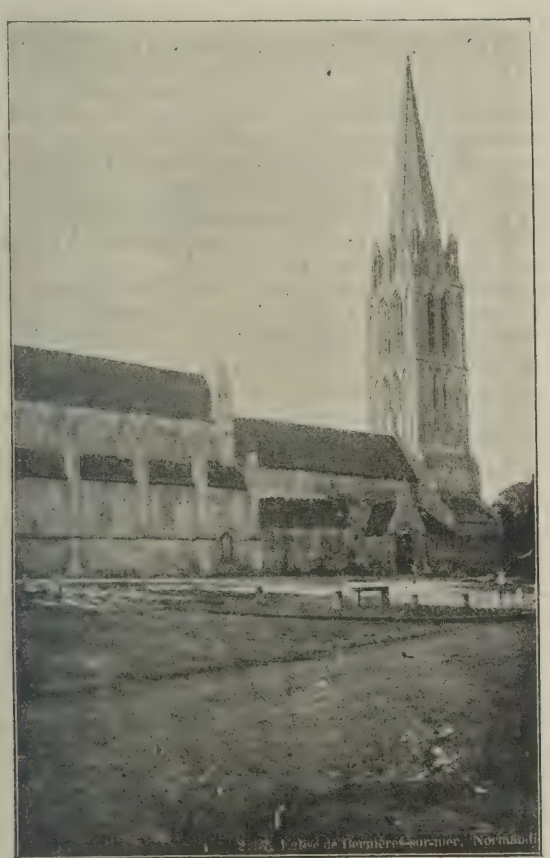
are surmounted by a low clerestory. The four arches at the "crux" recall Worcester. A fine Renaissance screen opens into the last chapel from the south choir aisle, while another fences off the north-west choir aisle from the transept. Westward the view is terminated by one of those grandiose organ-cases so common in the North of France; one equally rich is in St. Jacques. The nave has huge cylindrical piers with plain uncarved caps and very small arches, the aisles opening into chapels by plain arcades surmounted by a clerestory, as in the choir. In one of the Flamboyantly-traceried north-aisle chapels is some rich stained-glass (modern), with figures of Prophets and Evangelists. The baptistery, formed in the last chapel towards west, is enclosed by a Renaissance screen whose door has, *inter alia*, a carving of the Infant Jesus in act of blessing. Altogether, St. Remi, although of debased architecture, is marvellously picturesque, and no one should leave Dieppe without paying it a visit.

By those visiting the North of France for the purpose of studying its ecclesiastical antiquities Dieppe will be found an admirable *point de départ*. Given fine weather, a delightful trip may be made by omnibus, *viâ* St. Valery en Caux, to Fécamp, with its cliff walks and glorious abbey church of the Trinity. In another direction lie the quaint fishing town of Tréport, and within a short walk of it the great First Pointed church of Eu. Thence Amiens is easily reached. The railway line from Dieppe to Paris by Pontoise enables the ecclesiologist to visit Neuchâtel, Gournay with the neighbouring abbey of St. Germer, Beauvais, Creil, and the beautiful Oise-side village churches of St. Leu, Champagne and Auvers. Lastly, there is the route *viâ* Rouen, Louviers, Pont de l'Arche and Mantes.

The West Doorway, Rouen Cathedral.

Between Dieppe and Rouen the journey lies through one of the prettiest districts of Normandy, and to those unencumbered with luggage affords material for a delightful tourette, stopping for a few hours to study the life in such villages as Longueville and Auffay. There is a fine cruciform church in the latter, apparently of the thirteenth century, but which I shrewdly suspect is, like the one at Triel, between Mantes and Paris, not quite so ancient as it looks, the work of earlier periods having been so successfully copied at later ones as to deceive the uninitiated. Unfortunately, the ensemble is spoilt by a clumsy modern spire. The saddleback would have had a far more pleasing appearance; but the fact of this type of steeple not being a localism in this district of Normandy may have militated against its adoption at Auffay. At Malaunay carriages are changed for Havre, but the journey, though naturally delightful, is barren of architectural interest. Harfleur's noble crocketed spire and Graville's elevated square-ended Norman church—both close to Havre—however, reward us at the end of the journey. Montivilliers, with its great Romanesque abbey church, equipped with a typical pair of Norman spires, lies a little inland, a short ride only from Graville. We were, nevertheless, amply gratified at Havre, whose Notre-Dame, a curious mingling of Late Gothic and Palladian, seems hardly lofty enough for the head church of such a town as Havre; but it covers a large space of ground, and those who are sufficiently liberal in their architectural ideas may spend a pleasant half-hour among its columned aisles. Despite its architectural solecisms, Notre-Dame de Havre le Grace—to give it its full title—pleased us. It has a long unbroken vista from the west door, terminating in the painted windows of the apse, whose tracery, like that throughout the church, partakes of the unfoliated Flamboyant character one sees in certain Oxford college chapels. There is a great deal of painted glass, some ancient, but all in the landscape style so dear to the artists of the Renaissance. The aisles and flanking chapels are separated from each other by Tuscan pillars, those forming the nave arcade taking the form of responds, while the alternate ones in the aisles are isolated. We admired some tasteful grisaille glass in the clerestory, and in the small circular windows above either side entrance. Externally, the unfinished south-west tower, with its clumsy crocketed pinnacles, does not assist in giving the church any extra height, dwarfed as it is by the huge houses in the Rue de Paris.*

The sea trip from Havre to Caen is a very enjoyable one in fine weather, with which we were fortunately favoured, and in about three hours—two and a half of which are spent in open sea, and the remainder in the Orne, or its canal—the towers and spires of Caen came in sight, affording promise of a rich



South Porch of St. Ouen, Rouen.

architectural treat. We had, however, decided upon making a short stay at the seaside before commencing our ecclesiological researches, selecting Bernières as our halting-place, a picturesque, scattered village, very primitive, and therefore far preferable to its more sophisticated neighbours, Luc, Langrune and St. Aubin. Bernières has a noble Late Norman and Early Pointed church, with a spire the work as of an angel architect, one of the most beautiful of those steeples which, built upon one general principle, seem to have been dispersed through a considerable distance round Caen. Some of them have been much mutilated—that at Langrune, for example—while those of Norrey and Audrieu are still incomplete. An excellent drawing of this spire will be

* The church at Harfleur, which is also square-ended, is of a type not commonly met with in France, viz. that having nave and aisles of equal height, like the German *dreischiffige Kirchen*. Beyond the parish church there is little to detain the ecclesiologist in Havre. Should he be interested in modern French Gothic, a stroll up the Rue de Rouen to the church of Ste Marie will not be deemed misspent. At present only the choir and transepts, in a bold Early Pointed style, are finished, and these tower above a debased Italian nave in a very imposing fashion. The interior is particularly fine and the detail good.

found in Nesfield's "Continental Sketches;" also of the graceful trefoil-headed doorway to the west porch. One could hardly select a more charming spot than this for a few days' quiet sojourn. To say nothing of the architectural treasures presented by almost every village church in the vicinity, there is in front the fine open sea, with its excellent bathing, while on the other side lies the rich, fertile tract of country, dotted with veritable Norman churches, between Caen and Bayeux. Then, should the weather prove unfavourable for country excursions, a short railway journey lands one in Caen, with its treasures of ecclesiastical art; Lisieux and Bayeux are also within easy reach; so that, altogether, no ecclesiologist need repine should bad weather overtake him at Bernières. The sole attraction of this somewhat decayed-looking village is its above-mentioned noble church, consisting of western steeple and projecting porch, nave and lofty chancel, "mirabile dictu," square ended, whose aisles are carried alongside the tower to the extreme west. The nave, very rich Norman, bears marks of recent restoration. It is long and low, with lean-to aisles and lofty First Pointed north porch. The western tower, which is First Pointed, is in three stages; the two upper ones are lofty and enriched with four lancets, of which the two centre ones are pierced. The lower stage, which does not rise above the apex of the nave roof, has its north side relieved by a row of arcades broken by a traceried circle; the spire has open angle pinnacles and squinches, but is unrelieved by bands. The chancel, a good piece of First Pointed work, soars above the Romanesque nave, but it sadly wants restoration. Its western gable has flanking pinnacles and its windows consist of two unfoliated broad

CHURCH OF BERNIÈRES, NEAR CAEN.

lights of a plate-traceried character. Internally the nave, entered from the tower by a Pointed arch of singular beauty, has a noble Norman arcade of six bays, and is groined, as are the aisles. Throughout the church the detail is most rich and valuable to the student. Good open benches seat the nave, from which the chancel opens by a fine Norman arch; two graceful First Pointed arches open to the aisles, a Renaissance balustrade serving as triforium; the vaulting is rather depressed. On the north side of the sanctuary is a low arch surmounted by a trefoiled triforium arcade and a lofty clerestory, of which the upper part is pierced by a two-light window as in the choir. The foliated arcade alluded to above is carried round the east end, but is hidden in the centre by a tall Renaissance altar-piece of good workmanship, and although incongruous, better perhaps than the miserable Pointed reredoses one sees in French churches. The square east end has three fine First Pointed windows of two foliated lights each, with sex-foiled circlets. When the church was visited some years ago the restoration had not extended to the choir, which retains its eighteenth-century panelling, painted white. Above the arch opening to nave was a copy in fresco of Leonardo da Vinci's "Last Supper," fast hastening to decay. Two windows on the south side of the sanctuary are lofty ones of three lights trefoiled, and curiously crossed twice by transomes, three foliated and plate-traceried circlets filling the head. The whole church abounds in most delicate detail, and is throughout worthy of careful study.

A delightful walk was that from Bernières back to Caen distant about ten miles, on a brilliant summer morning with just enough breeze to ward off the heat. Passing through Langrune, we stopped to rest and examine its church, a First Pointed cruciform structure, low and long, and with a finely proportioned centre steeple, which, however, has a rather forlorn appearance, since it has lost not only its squinches and broaches, but also its capstone and vane.* Langrune Church abounds in delicate detail; we especially admired the clustering shafts supporting the arches of the tower, also the groining of its apse. With the nave we were hardly so pleased. The arcade is a low one of eight bays, with short piers and Pointed arches. Above is a blind arcaded triforium and clerestory of single lancets. The effect of this is no doubt pretty as a *coup d'œil*, but sober reason tells us that this triple arrangement is unsuited to a nave of such low pitch as Langrune. Resuming our walk, we soon reached La Chapelle, whose large modern church of Notre-Dame de la Délivrance, with its pair of spires, is visible at Bernières and a good way beyond it. We could not admire this church externally, being like most modern Continental Gothic, lean and poor and quite unpoetical. It is cruciform in plan, and just east of each transept is a tower and spire, differing, however, in design. Beyond is a pentagonal apse with incipiently traceried lancets, and at the apex of the roof a huge gilt angel; but internally this church is a most masterly conception, and entering it as we did from the sunlit square, we were hardly able at first to distinguish its details owing to the profusion of stained-glass. Low arcades on either side of the nave admit to pentagonal chapels in lieu of aisles, and support a lofty clerestory of Early-traceried windows. The chancel is long, devoid of aisles, but richly arcaded beneath the windows. Against the northern pier of the arch opening into it stands an image of the Blessed Virgin and Holy Child, both attired in long blue robes. They are placed beneath a spiral canopied niche, reminding us of one of the German Sacramentshäuschen.

(*To be continued.*)

GLASGOW ARCHITECTURAL ASSOCIATION.

A PAPER by Mr. Austin Woodeson, Association Travelling Student, was read at the usual monthly meeting of the Association, held in the rooms, 187 Pitt Street, on Tuesday, November 1, Mr. Geo. S. Hill, F.R.I.B.A., president, in the chair. Mr. Andrew Rollo, in Mr. Woodeson's absence, read the paper, which was a description of a sketching tour of a fortnight's duration made by him this summer in Berkshire and the surrounding counties. The paper was illustrated fully with about thirty-five drawings executed by himself during his stay. The drawings, which showed buildings in Reading, Bray, Mapledurham, Abingdon, &c., comprised illustrations of churches, almshouses, &c. Many of the buildings were further illustrated by large-scale details and measured drawings. Mr. Woodeson referred to the southern counties of England as offering to the architectural student an excellent sketching ground. All types of building, in styles ranging from Norman to Elizabethan, were to be constantly met with. At the close of his paper Mr. Woodeson was awarded a hearty vote of thanks.

* A general view of the exterior of this church at Langrune i given in Petit's *Architectural Studies in France*. It is one of those professedly rough copies of rough sketches with which the author partly illustrated his fascinating book. Intended to convey little more than the general character of the buildings, such drawings, though useless in point of detail, are marvellously faithful as regards outline and ensemble.

NOTES AND COMMENTS.

Much dissatisfaction is felt in Paris about the scheme for the conversion of the lands of Villeneuve-l'Etang into building estates. The ground is adjacent to Parc de Saint-Cloud, and the sale is considered to be only preliminary to another of the beautiful park which delights strangers as well as Parisians. It is believed the sacrifice is unavoidable. Taxation is already almost beyond endurance, and a couple of millions of francs would be a welcome addition to the national exchequer. There is a fine modern house in Renaissance style on the estate, which was intended for the officers of the guard on duty at the palace of St. Cloud. It was lent for a time to M. Pasteur. Villeneuve l'Etang has not many historic associations; in that quality it is surpassed by its neighbours, but it is a part of the open space which Paris should preserve, and its conversion into plots, if successful, will be sure to lead to similar experiments with the public lands.

The Municipal Council of Paris have agreed to allow a statue of the late Jules Simon to be erected in the open space before the Madeleine. It is not intended to suggest that the psychologist, statesman, philanthropist and economist was officially connected with the church. The intention is to show that in a modest appartement far above a near restaurant Jules Simon lived during the last years of his life on earth. He was one of the wisest of Frenchmen, and held various offices with advantage to his country, but to the end he was compelled to depend on his pen for an income. The statue will be the work of M. Frémiet. Jules Simon will be represented as seated with his hand resting on the head of a child, for he was an advocate of the necessity of State interference to secure the bringing up of the young in such a way as would bring credit to France. Beside him a heap of books will be introduced to suggest the professor, scholar and publicist. On the pedestal will be a relief of one of the historic scenes in which Jules Simon took a prominent part.

The ancient church of St. Pierre on Montmartre is in so dangerous a condition it is never likely to be used for services. The great parish is, therefore, in a difficulty. To approach the basilica of the Sacré-Cœur is no easy task for the old or infirm. The curé has consequently decided to erect a cheap church near the Place Pigalle, where representatives of the arts daily and nightly congregate. The plans were prepared by M. de Baudot, who is well known in Paris as an official architect and professor. In the construction béton armé, or concrete with an iron trellis embedded in it, will be largely used, and there will be much vaulting above and below the ground. The system enables work to be executed quickly. The crypt is completed already, and will be utilised as a chapel for services and the instruction of children. With so many artists around it would be strange if the walls were unadorned. MM. Rousseau and Paul Sieffert have painted an immense picture on one end of the crypt. It represents an incident in the life of St. Peter Fourier, the founder of an order, who devoted a great part of his life to the education of children. It is anticipated that many other artists will co-operate in making the church significant of the district in which it is placed.

The wall-decoration of the Panthéon, Paris, is now almost complete. The late Puvis de Chavannes before his death had completed a second series of four panel illustrations of the history of Ste Geneviève. He also left four sketches for the upper panels, which are to be completed by one of his pupils. There is much curiosity to see the effect of the four symbolic landscapes to which M. Humbert is giving the finishing touches. They represent dawn, noon, evening and night. But they are intended to suggest ideas of the Deity, the Family, the Fatherland and Charity. Landscapes are not so often employed as figure-pieces for architectural decoration in France, but a great many scenes in Paris and the environs are introduced in the Hôtel de Ville. The Salon exhibitions also often present examples which are commissioned for public buildings in the provinces.

Another appeal has been issued for aid towards the restoration of Winchester Cathedral. About two years ago it was decided to strengthen the roof of the nave according to plans by Mr. Colson, which were endorsed by Sir J. Wolfe Barry. All the repairs of the roof and the more difficult operations on the stone vaulting of the nave, which was in a critical and dangerous condition, have been executed, but there are several works still to be taken in hand, the most urgent of which is the repair of the south aisle of the nave. When these have been finished the whole of the main fabric of the cathedral will have been put into a state of sound and solid repair. There is no fabric fund to draw upon, and the estates from which the cathedral revenues are derived have been reduced to about half their former value through agricultural depression. The Dean and Chapter have, however, undertaken to contribute out of the capitular incomes 1,350*l.* About 7,000*l.* has also been raised by public subscription, but a further sum of 5,900*l.* is still required, partly to extinguish the debt, amounting to about 4,500*l.*, due to the contractor and architect for work already completed, and partly to meet the cost of work not yet commenced but urgently needed.

The difference in spirit which occasionally exists between two county councils was exemplified this week in connection with the proposition for the erection of Kew Bridge. When the old bridge was declared to be unequal to the traffic Surrey endeavoured to cast the whole, or the greater part, of the expense of a new bridge on Middlesex, while Middlesex was eager that Surrey should have the privilege of the construction. Then it was arranged that both counties should share the expense. Sir J. Wolfe Barry prepared plans for the bridge, but the ardour of the two authorities had cooled and the designs were left unused. When at last tenders were sought it was found that the lowest exceeded the engineer's estimate by about 50,000*l.* According to Sir J. Wolfe Barry prices had increased in the interval, that of granite being doubled. The Middlesex County Council on Monday, by a majority of eight votes, declined to consider the subject, and adjourned the meeting until the 14th inst. On the other hand, the Surrey County Council at their meeting on Tuesday resolved to adopt the report of the joint committee, which stated that after careful reconsideration the committee were unable to recommend any further reduction in the revised estimate of 149,000*l.*, and recommended that an Act should be obtained for fresh borrowing powers. It remains to be seen whether the Middlesex Council will accept the arrangements.

Belfast is so rapidly advancing, it is not surprising that the citizens are not content with the modest church which serves as a pro-cathedral for the diocese of Down, Connor and Dromore. The new city hall, when completed, will have, moreover, the effect of demonstrating that the secular power is stronger than the ecclesiastical. Accordingly, at the diocesan synod on Wednesday, it was moved, "That the Synod approves of the provisions of a Bill to be introduced at the General Synod of the Church of Ireland in 1899 for the establishment of a cathedral in Belfast." But when proposals of that kind are heard, there are sure to be opponents who are not enthusiastic for a grandiose building, and in Belfast the Scottish influence, which is not in favour of the cathedral system, is strong. The following amendment was, therefore, proposed, "That in view of the most urgent need of church extension in Belfast, this Synod considers that the present is not an opportune time for giving its approval of the proposal presented to it to build a cathedral." As a large majority was in its favour, the original proposition was carried.

NEW GENERAL POST OFFICE, NOTTINGHAM.

147 OXFORD STREET.

DAME OWEN'S STATUE, IN THE HALL, DAME OWEN'S SCHOOL ISLINGTON.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

THE opening meeting of the sixty-fourth session was held on Monday evening in the Council Chamber, Conduit Street, Professor Aitchison, R.A., president, in the chair.

The Honorary Secretary announced the decease of the following members :—Major Alfred Heales, honorary associate, elected in 1882 ; Henry Hewitt Bridgman, elected associate in 1871 and fellow in 1883 ; John Gillett Livesay, elected associate in 1882.

Mr. William Nicholson Cumming, of Edinburgh, was reinstated an associate.

The result was published of a statutory examination of candidates for the office of district surveyor under the London Building Act, 1894, held on October 27 and 28 last. Three candidates were examined, and the following gentleman passed and was granted a certificate of competency to act as district surveyor in London, viz. Mr. George Henry Blagrove, of Regent's Park.

President's Address.

The President prefaced his address with a short comment on the work of the late Charles Garnier, and then said :—

I think we may be congratulated on the improvement that is taking place in the appearance of London. It is a great triumph for architects to think that they are converting a rather dull city, mostly composed of brick walls with holes in them, into a town almost as picturesque and varied as the old towns of France or Flanders.

I think it was in the forties that Professor Cockerell, at the Royal Academy, gave the approximate number of the new churches and public buildings that had been erected in the preceding thirty years; but that list, astonishing as it was, would dwindle into insignificance beside the new buildings that have been erected in and around London within the same lapse of time.

Of very important buildings in the centre of London there have necessarily not been very many, but in the outskirts numberless town halls, technical schools and other municipal buildings have sprung into existence, and though I am afraid we can hardly claim for most of them that they have rivalled the picked examples of the world's architecture, they mostly have some stateliness, picturesqueness or originality.

I regretted to read the remarks of Mr. Norman Shaw, who has been acting as one of the assessors on the designs for the buildings of the Californian University. He said that "the competition had been held in the hopes of discovering some architectural genius, but in this it had failed," and he felt "a twinge of national regret when no English name appeared among the selected eleven ;" the plans selected were without exception of the French school. "Architecture," said Mr. Shaw, "is more thoroughly taught in France than in England ; at the same time French teaching destroys individuality." It is a matter for regret that an English-speaking race should have to go to our neighbours for their architecture ; but that may be because there is more architectural genius among our neighbours across the Channel than among the English-speaking countries on both sides of the Atlantic and in the Pacific ; yet it is peculiarly unpleasant that a celebrated English architect can justly speak of a more thorough teaching being given in France. One naturally asks, Why is this? For one would think that what is teachable could and ought to be as well taught in England, America and Australia as it is in France ; at any rate, the first thing that the English architects should do is to see that this inefficiency is corrected. I can hardly believe that teaching, if not carried far enough to stifle independent thought, can extinguish individuality, for certainly some of our great poets were the best educated men of their day. As far as we know we cannot give ourselves genius, but it is most probable that, if a large number of persons will acquire that which a good architectural education can give them, there will be a genius among them ; and surely a well-taught genius is better than an ill-taught one.

There is a most interesting book written by M. Edmond Demolins, who says that the education given to the English has peculiarly fitted them to be successful colonists. Whether this method of education was deliberately chosen, or whether it was stumbled into through the natural bent of the people, does not appear ; but we can only hope that, either by accident or design, we may find as successful a method of teaching architecture ; for every English-speaking man in the world must wish that we could produce buildings that would vie with those produced in the most brilliant epochs of Greece and Rome, of France and Italy, and with the best Saracen buildings, and with the Gothic ones that pervaded Europe during the Middle Ages. We cannot hope, however, to equal the excellence of monuments that sprang into existence after stirring times, in nations where there was an adoration of the beautiful, particularly when one of these nations is believed by some philosophers to have possessed faculties as superior to those of the nations of Europe as the faculties of European nations are superior to those of the negro.

Architecture is the poetry of construction, and the noblest poetry is naturally found in buildings that are applied to the highest transcendental uses. A certain amount of comeliness is necessary to every building, except such buildings as are required to create fear, horror, or a sense of ignominy, such as castles, gaols, gallows and pillories.

A building is an organism created by man for his own needs that should emulate the organisms of nature. To take man as the highest organism, we may say that the man of the most striking appearance is not a perfect organism if he has some incurable internal defect ; and so in a building no beauty will wholly compensate for its want of answering the purpose for which it was built, and even if it answer its purpose, and has a beauty that is quite incongruous with its use, it becomes as ridiculous in the eyes of judges as a man in a state dress acting as a scavenger. In some of the modern buildings that at first sight affect us strongly, from their size, mass or ornamentation, if we see that this size and this massiveness are not necessary, that these embellishments are not consistent with the uses of the building, we merely despise the factitious effects.

As our knowledge of the strength of materials, of the strains and stresses that result from the different forms of buildings becomes more accurate, it will naturally affect the shapes of the different parts of the building, and I think we must look very much to this for future advancement in architecture.

We want to mark those portions of buildings that have special duties to perform with that architectural emphasis which is given by mouldings, and these mouldings have to produce the effect we want in our own climate. To use mouldings that were designed for climates different from our own, and consequently do not properly answer their purpose, is really to declare ourselves indolent or incompetent ; we have plenty of plausible excuses, *i.e.* that the Romans used the same mouldings whenever they built, and that their Renaissance imitators did the same, and that the archæologists our masters would be shocked at any architect who attempted to think, but neither excuses nor bad examples will avail us if our sole object is to advance our art. We have too to consider the purposes to which our buildings are to be put, the ratio of strength we must allow when a building is merely for a temporary purpose or to last as a record for future ages.

According to the uses which the building is to subserve we must consider the ornaments that are to be given to it by the sculptor, and whether their forms are to be taken from vegetable life only, or are to include animals or man. Where buildings are to be used for the highest intellectual or moral ends it is perhaps difficult to find even figure sculpture that will sufficiently express their high use. In Classic and Mediæval times at least, sculptors employed for this purpose mythical or symbolic figures. In the present day we have almost given up all symbolic and emblematic forms, and have trusted purely to words, which do not strike the multitude, and have not, in the bare form in which they are mostly given, the same effect on the mind as symbolic forms. Sculpture is wanted on all buildings, but its use should be imperatively called for by the people for all public buildings, for the sculpture, if properly designed, would more completely show the use of the building, and surely the public who pays for these buildings should be informed of their use ; and this is particularly called for when the buildings are for benevolent purposes, such as hospitals, asylums, workhouses, rests, refuges and homes. The speaking arts of sculpture and painting are particularly wanted for enlightening the people on the advantages of living in a free and advancing country. It is for statesmen to consider how much more contented the population of this country would be if the fine arts were used to proclaim the advantages the people enjoyed.

The subject of colour is one that has of late years fallen greatly into disuse, but, as far as I can comprehend, very unnecessarily ; for as nature colours all her works, and produces every sort of emotion from the combination of form, light and shade, and colour, it can hardly be inappropriate for man to do the same ; and all architects know that monumental colouring may be as well marked as monumental form.

Hitherto the proportions used, or, as the ancients more properly called them, symmetry, which forms so important an element in architecture, has been almost confined to those taken from the highest transcendental buildings of the past ; but we see in nature every conceivable proportion, and most of these are good ; consequently it is only from want of observation and want of skill that we confine ourselves to the proportions of Greek, Roman, or Mediæval work ; for Egyptian, Assyrian, Arabic, or Indian architecture has found no great favour in Europe.

The thing we want most is the advancement of architecture, but who is to show us the way? A deceased architect of marked ability said we must wait for another irruption of barbarians, and probably if they were barbarians of improvable quality they might solve the problem ; but it would be a drastic measure that most of us at least would pray might not occur in our time. I think the greatest obstacle to the advancement of architecture is the fact that the bulk of Englishmen do

not care about it in the least, and, as far as I can judge, the fine arts are not likely to improve if no one cares for them. So every architect should be ready to point out what architecture does for a nation, and so help to create the want.

Architecture—and by that I mean good architecture—must even from the size and importance of its monuments create some sort of emotion in the beholder; and the least reflection will show him the vast army of various men that have been employed to get all those materials, and to bring them together, the thousands of craftsmen wanted to fashion them and put them in their places; and according to the stateliness, the impressiveness, or the beauty of these buildings will the power, wealth and grandeur of the nation that has erected them be brought before his mind. If these buildings are for the highest purposes and clearly express their character, deep emotion will be excited in him, and he will also think of the science that these buildings presuppose, the artistic skill of the architect and artists employed, and of the artistic tastes of the nation at the time in which they were built. As the late Charles Garnier said, "Architecture is an obtrusive art." Its masterpieces thrust themselves upon you and cannot be hid in a corner, and as long as they remain they call from the people who wish to see them a journey to the land of their creation; so if we want a good account of our time to be given to posterity, we must pick out good architects, encourage them to do their best in erecting important, well built and æsthetic structures; at any rate, if this is neglected the age in which we live will be lampooned.

The painters and sculptors laugh at us when we say we want the public to show us what they like and what they want, and say, "We struck out a new type of woman never before painted, and new methods of treatment, and the public appreciated it and asked for more;" but their case is quite different from ours. It is not pleasant, I confess, for a painter to paint a picture or a sculptor to model a statue that does not sell; but an architect cannot put up a monumental building in the hopes that the public will approve of it and pay the expense. The most he can do is to show a drawing or a model in public, and persuade men in power or of immense wealth that he is both capable and original, and will be able to charm the public by his work. How did the architect of the Erechtheum persuade the State to employ him? So small a monument as that of Lysicrates could well have been shown by a model.

To get the proper teaching is not so easy as to say we want it, but I think in architectural education, as in general education, we must endeavour not to teach that which is dead nor that which is useless, but confine ourselves to the necessary and the useful. I think it is obvious that architecture is the poetry of construction, and consequently the very first thing to be taught is construction, and it is not the mere rough knowledge of the main principles, but that exact and accurate knowledge which was possessed by the late Romanesque architects of the properties of stone. They got this knowledge mostly by the failure of their buildings, but they reasoned on the causes of the failure they observed, they thought and they dared; while we have most accurate means of testing the strength of every material that falls to our hand, and if we be mathematicians we can solve every stress and strain as the engineers have done. We have many new materials that our predecessors had not, and some of extraordinary strength and of a capacity for taking nearly every form with ease; I speak here particularly of cast-iron. This is not without dangerous qualities when exposed to fire, but we ought not on that account to neglect it. With wrought-iron we have other difficulties to contend with besides the danger of fire, for it is very difficult and still more expensive to make this in any agreeable or beautiful shape and to ornament it; but we cannot believe that the Mediæval architects would not have largely used both materials if they had possessed them. We have, too, practically a new material in concrete, but this material also is not without its difficulties and its drawbacks, and we have, besides, the whole of what I may call old-world materials to our hand to deal with structurally in a more perfect way than they ever could have been dealt with before, and the whole category of old shapes to use and new forms to adopt that have never been used before. If the dictum of Sir Joshua Reynolds be true, that by becoming familiar with the invention of others we learn to invent, the great knowledge that we possess of past architecture should make us more ready to invent; but in fact the gift of invention, so far as architectural forms are concerned, seems almost extinct. We have only this to say in excuse, that from the fifteenth century to the middle of the last century European architects had nothing but Roman architecture, or its Renaissance imitation, to study and to use; since then we have had Greek and Gothic. Neither of these styles, however, was used to stimulate invention, but merely to copy, and even in the present day it is doubtful whether the invention of a new form, unless it were surpassingly beautiful, would be tolerated, for antiquarianism has usurped the place of architecture.

We must of course study the expressive and beautiful buildings of the past to learn how their effects were produced; but having learned that, our object should be to invent other proportions and other shapes, whose effects shall be equal or superior to those of the past; and when I speak of invention it is merely the adaptation of some of the innumerable forms of nature. In the present day we should say that there was even less invention amongst architects than there was amongst the Romans, for the Romans at least started a new method of adornment when they carved the shafts of their columns or covered their pilasters with running foliage; but of course it is to the Gothic architects that we must look for those rapid adaptations that we now call inventions. Gothic architecture from the time that it emerged from Romanesque passed rapidly through what we call Geometrical and Decorated, till it fell into the mechanical stiffness of Perpendicular. Were these men blessed with greater powers of invention or adaptation than we are? or is it that the gift has become atrophied for want of use? At any rate, the substitution of archæology for architecture must tend to this result, for if the wing of the apteryx dwindled to the size of your thumbnail for want of use, it is probable that our powers of invention will do the same. I think that we are not so destitute of invention as we appear to be, for in out-of-the-way places in the country you see the elements of new Gothic and new Classic, where the architects have not been very learned, and have not had the fear of the archæologist before their eyes.

When one speaks of invention, good invention is meant, and if we have the gift of invention it is only by the constant exercise of it, and by comparing our inventions with the excellence of the past, that we are likely to progress. I feel sure that the architecture of one century, or perhaps even of one quarter of a century, should not exactly resemble that which went before it, for besides our proclivities and aspirations not being exactly those of our fathers' time, if our knowledge and invention were progressive we should want the one for use and the other for emulation. In poetry we do not want the poets of our own time to portray again the character of times long past, for in that we can take but small interest, but to portray our advancing knowledge and the good, striking and dramatic characteristics of our own time, as Tennyson so transcendently did; and we must never forget the labour and study he undertook to perfect himself, for he learnt Hebrew to see how the Hebrew poets arrived at sublimity. I do not speak about ornament, whether carved or painted, for that is the business of the sculptor or the painter. I by no means wish to discourage architects from being painters, sculptors and ornamentalists, so long as they are good architects as well; but it is absurd to give up the advancement of our own art for the sake of being dabblers in the arts of others. I have said nothing about the art of planning, although that is a most important art, and in these days, where convenience is thought of more importance than anything else, it is the art by which most competitions are gained. No one can deny that it is a useful art, and may be a very impressive one, and I am sorry to say that in its highest form it is not sufficiently studied.

I must say something on the results of our own examinations, for they have had a very stimulating effect on the students. The examinations let them know some of the things they ought to study and give them an object to aim at. Examinations, however, have certain shortcomings like everything human, they test insufficiently. Besides a parasitic growth clings to them, they lend themselves to cramming, whilst to cram is the last thing we should wish any architectural student to do, for it is a pure effort of memory to recollect what has been before written or said and repeat it at a given time, while the great object of instruction is to teach people to think and act properly. The sort of memory architects want is for the thing to be remembered to be firmly and permanently fixed; while anything crammed, when it has once answered its purpose, is almost immediately forgotten and leaves scarcely a trace behind. Architecture in every one of its three branches requires accurate thinking to the end in view, and no cramming is of the slightest use in that direction. The only use I ever heard claimed for it is that it enables a man to seem to know what he does not know, which may be useful on occasions.

The plan or arrangement of a building requires to be made perfectly suitable for its purpose, and in the cases when the building is not for common use it should have a certain effect, and if for high purposes the forms require to evoke feelings of dignity, stateliness, sublimity or awe. I cannot refer to more perfect examples than the Parthenon and the inside of the Pantheon. Plans embody not only the general conception of the building and its supports, but should roughly inform a skilled person of the whole scheme of the completed building. We judge of the constructional skill of the architect by the smallness of the ratio of supports to the total enclosed area.

Every one of the three branches of architecture is not only sufficiently difficult, but may be considered transcendental, *e.g.* when we look through many plans we see that some are not only more convenient and more striking than others, but sometimes it seems as if the great planner were first and the rest

nowhere. As buildings are meant to stand, it has always struck me as rather a paltry trick to arrest attention, to make a building look unsafe, or to put in a piece of construction which forces us to ask how the architect has managed to make it stand. We want everything to look stable, so that our whole attention may be given to the æsthetic effect; but at the same time skill in construction will enable us to give great variety in the different parts of the building, some parts being slight or slender as compared with the important members of support, which must necessarily be bulky. No building should be put up that has not some evidence of the intention to make it comely, unless it be those buildings that are intended to convey horror or antipathy, of which I spoke before. Every building wants character, and that character should show its use; and when buildings are for the purposes of dignity, reverence or awe, it is most important that their proportions should excite these feelings, and that any sculpture or painting that is put on them should heighten their effect in the same direction. Although it may seem a paradox to say so, the special convenience that should attach to every building is not so important in the highest sort of monuments, as for the monument to excite a feeling of sublimity, and for this reason that high thought clothed with beauty is much more lasting than ordinary wants. If we could call to life the high priest of the Parthenon he might tell us that Iktinus and Kalikrates made the temple very inconvenient for the service, but for more than fifteen hundred years that service has been abolished, and we are still enamoured of the sublimity of the temple.

The principal things that want teaching when construction and the art of planning have been mastered are the proportions that have raised the various emotions in existing buildings, the art of moulding and the exercise of the inventive faculties, for it is doubtful if invention is denied to any average human being, although some have it in such profusion that it is easy to them to invent, and you probably recollect Plato's saying that those entrusted with public duties should find them easy. I have so often said before, the construction should be the best that is known and practised, and that any construction that is used merely because it is old is mere pedantry.

In every new building we arrange, difficulties arise in giving the necessary parts that æsthetic expression that we wish them to have. It is comparatively easy to mask the construction so that we may use the æsthetic solutions of deceased architecture, and so long as we pursue this course, architecture can never advance. What should be done is to encourage the student to solve the difficulty in his own way, and that is why ironwork is so serviceable, because in that the student has nothing to copy from, and he must use his inventive powers. Very long columns and stanchions, for instance, have junctions that must be kept together by ugly lugs and bolts or some other cumbrous addition, and these have to be made graceful or beautified. There are difficulties about moulding in iron, and in trying to solve these difficult problems the student should be recommended to aim at simplicity and elegance. If after many trials he cannot do anything towards a solution of these problems, he should abandon architecture.

As regards the practice of some of the younger members, there is too much straining after effect; too much recourse to easy means of arresting attention, such as by rustics; too much partiality for curious and incongruous forms; the sewer-arch or water-opening is too much adopted for entrance doorways and attic windows—anything for a novelty; corners of square openings are rounded off and projecting members are slightly curved or bellied out. Now there is, in my opinion, nothing like straight lines for dignity, and the rounded corners and bellied door and window heads mostly produce meanness. Another device is to make columns like those barrels that are used to fill in the odd spaces in ships, where the middle diameter is nearly double that at the base and necking, a gross and vulgar caricature of the entasis of the Greek columns. This device truly arrests attention, but only to make the judicious observer note the absence of any feeling but for vulgarity. Architecture is a very difficult fine art, and these attempts to attract attention easily merely show want of proper training and laudable ambition. Horace's maxim is as true now as it was then, that "you should study Greek examples by day and by night." The simplicity, grace and restraint of Greek work cannot be too much studied, and that profusion of ornament that is now so common is not only opposed to Greek practice, but to good taste, for, as has been truly observed, nothing great is obtained without simplicity.

There is one feature we want badly, and that is a well-designed large window, for there is great demand for these in the new public buildings, and we have nothing but the huge Roman semicircular window of the Baths, and the west end Perpendicular windows, which have little claim to beauty.

There is a great want of study of lighting; half the effect of large complex interiors is got by concentrated light against "a mighty contiguity of shade," while most of our buildings are spotted all over with windows. One of the architectural devices the student should study is to get harmonious grouping of immense windows with those of ordinary and small size, and another is how to treat the problem of the seventeen-storey building; for though we have not yet adopted this American device, the increasing scarcity of ground and price of land in large cities tend to produce it.

The only use of these addresses is to correct mistakes in teaching, to point out, if one can, where the defects in our practice lie, and to stimulate each other to greater exertion, and, if possible, to find out the way to the advance of our art. The chief things that act as incentives to mankind are the hope of wealth, the hope of honours and the hope of immortality; and I certainly think that we might well increase one incentive by insisting on being paid for our work, for we are not paid now. I think the powers that be might well make another incentive more common by bestowing honours on the profession, which is now hardly recognised, although it does so much to raise the reputation of the nation by designing monuments which persons from all parts come to see. I can only hope that the prospects of immortality may induce those with congenial genius and the highest ambition to devote themselves to architecture, and to spare no thought and no labour in perfecting their work, so that it may vie with the best Greek in grace and with the Mediæval in impressiveness. We all wish that a great architectural genius may arise for the sake of our art and of our country; and it is good for everyone but the genius, for his highest traits are mostly brought out by misery. As Shelley says, "We learn in suffering what we teach in song."

I think, or at least hope, that with all the present teaching, striving and devotion we shall find the true path of progress, and that in the near future architecture may realise the transformation of the dragon-fly:—

> To-day I saw the dragon-fly
> Come from the wells where he did lie.
>
> An inner impulse rent the veil
> Of his old husk: from head to tail
> Came out clear plates of sapphire mail.
>
> He dried his wings: like gauze they grew:
> Thro' crofts and pastures wet with dew,
> A living flash of light he flew.

Lieutenant-Colonel Prendergast, in proposing a vote of thanks to Professor Aitchison, said that the President must have found that it was necessary to deal carefully with such an architectural Fashoda and Marchand as were embodied in his address. As the time was warlike it would be well, he thought, to have some of the spirit of it introduced in the Institute. Why should they not take sides and have a discussion on the President's address, which might be the means of increasing the impression it produced?

Professor Roger Smith, in seconding the resolution, said it was very difficult to consider architecture with a clear mind; they could not easily get rid of the associations which were connected with Greek and Roman and later buildings. It was therefore only to be expected that the nearest approach to originality would consist in modifications and new combinations of older elements. Some might doubt whether we were advancing, but let anybody compare the illustrations in the technical journals of to-day with those published in them a quarter of a century ago, and the difference would be manifest.

SIR EDWARD BURNE-JONES.

ON Monday, at the Birmingham and Midland Institute, Sir William B. Richmond, R.A., delivered a lecture entitled "A Tribute to Sir Edward Burne-Jones." He said when he had the honour to be invited to address them at that famous Institute his first impulse was to decline—partly because of the many demands upon his time, but chiefly because he did not at once see his way to a subject which would interest his audience and stimulate himself. Upon second thoughts, however, he determined to accept the invitation, because by doing so an opportunity would be afforded him to enter in sympathy with them upon a subject of which they were justly proud, and in harmony with his sympathies. For had not Birmingham the honour of being the birthplace of Sir Edward Burne-Jones, in his way and after the fashion of his genius the greatest of English artists of this or of any time, and who was equal in many respects to the great names which adorn the art of Italy? Sir Edward was born in England, but his spirit was born in Italy. Birmingham had produced great men, among others two happily still with us—a renowned politician and the Prince Bishop of Durham, Dr. Westcott. Dr. Lightfoot, second to none he believed as an historian of the early stages of ecclesiastical history, and Sir Edward had passed to their rest; their work was finished, but their labours are enduring for all time. The two prelates and the great painter were contemporaries, and educated at King Edward's Grammar School. Each in his calling had manifested his genius and

that indomitable power of work, patience and persistence in overcoming difficulties without which genius is not only valueless but a snare. Of these distinguished men the artist was, perhaps, the greatest, for he is the rarest product of modern life. There have been other centuries more sympathetic to the artist than this has been. But with all its drawbacks a practical spirit was shown by a section of the public—not large, perhaps, but influential—that there is enthusiasm in England for the noblest forms of art. Sir Edward fought bravely in the cause which was his, for what he liked and what he enjoyed doing. Finally he won. He won by persistence, by sincerity, and in spite of initial prejudice he attained the highest distinction, and commanded not only respect but gratitude. Those who respect his work are legion, those who love it increase in very remarkable proportions. His art finds keen admiration all over the world. His audience must not, he said, expect from him critical remarks. He was not a critic but a painter, whose business was to create, not to destroy—to win over to the side of beauty whoever may be wavering. What he should say had been formed by conviction, and he might state at once that he was in profound sympathy with Sir Edward's art. The question often asked, "Will the art of so-and-so live," was a silly one, and it was impossible to answer it with truth. What concerned them was the present Does such-and-such an art live for us?—is it a vital expression of something felt, something desirable, hitherto dreamed of, perhaps, but unstated? That was a question worth considering and worth answering. Fancy the critics of the day—and he dared say there were such—wasting their time by questions regarding the effect upon future generations of the art of Pheidias, Homer, Michel Angelo, Shakespeare or Milton. He suspected that no age had been exempt from silly people; unfortunately ours prints and so hands down the follies. The common saying that poets are born and not made was, broadly speaking, true. Equally true was it that certain races were more creative than others. Artistic temperament was evidently more commonly a Celtic than a Saxon property. Sir Edward Burne-Jones and William Morris were Welsh by descent. As co-workers, as well as individuals, they had exercised enormous influence upon modern thought and taste; in combination they revolutionised the attitude of the upper middle classes towards the domestic arts. They had refined the taste of England. In combination they made the best stained-glass of the century. Those artists gave their great gifts, their labour and self-sacrifice to their country for its pleasure and use at the present and future. An artist revealed himself by his craft; through it he transmitted his most delicate impressions of nature, his sensitive imagination, as well as by his patience, industry and love of perfection. He set forth his best with affluence, for his own delight, and by so doing he pleased someone else and perhaps many. When he ennobled his own he ennobled others' lives. But his first instinct was to please himself. Through his craft he kindles our imagination, sets before us his ideals of beauty, tells us delightful stories, or presents in portraiture great men and lovely women for us and for our children's children. And it was thus that the arts must hold supremacy over every other product of mental activity, as being the most civilising in the true sense and the most enduring. They are, as it were, a part of us. Sight, hearing and sympathy are the most delicate cords of emotions which are set into vibration by beauty. Art which is not beautiful can scarcely be said to exist at all. Art and ugliness are antagonists. Sir Edward from first to last was always seeking fresh and more delightful means by which to set forth his fertile invention and exquisite sensitiveness to beauty. He was ever at the feet of nature, always her lover, but also her master. He was a poet in a true sense, not only literary, but in the highest degree graphic. His appreciation of beauty was second to none. Leonardo, who had the same kind of fantastic imagination, was not endowed with more exquisitely-tempered sensibilities. His instinct also was his strength. His genius started him, his patience made him. That wonderful thing, originality, which, when absolutely spontaneous, was a quality to the last degree winning, was his. It was not startling or shocking, but of a very human origin—sympathy with all that finds a place where love is. Referring to church decoration, he said religion and beauty would be united; their union was right and natural. No longer are our churches to be ill-kept and ugly barns. They are to be places of worship, wherein the beautiful stories which have made religion what it is are to be exhibited upon their walls for the delight and instruction of the poor as well as the rich. To Sir Edward and to William Morris are due some seven hundred stained-glass windows in this country, among which are some of the most delightful designs ever executed. The art of Burne-Jones, he maintained, had been very ill-defined whenever it had been called "limited." Few men had ever made such exquisite drawings as he, and in every kind of medium. He meant that if they took the great masters of line, who should they call his superior? As a colourist how various—now pale and silvery, presently full, rich and glowing; then in almost monochrome, what delightful tint of varieties of hues he gave. Burne-Jones was not only the most prolific designer of his day, but the most various—he even did exquisite drawings for jewellery. No, our fellow townsman was not limited except in as much as he was human. Before concluding Sir William said he desired to make a few remarks upon the future of art in England. They would be entirely in sympathy with his subject. Happily there is growing a very healthy desire for the union of the arts, and in that a wholesome dislike of specialism. Then, also, the arts are widening their scope and play, therefore they are acquiring a firmer as well as a wider sympathy. Painting of pictures is slowly becoming to be regarded, as no doubt it is, a very important branch of the arts, but not the only one. The marked strides that sculpture has made in recent years is very remarkable. He questioned if England had ever had cause to be so proud of her sculpture as at present. Among us we could name many men who are doing first-rate work—most of these are in the prime of life—and there is evidence that there is a younger race springing up, whose energy and talent will ere long come to the front. The younger school of architects is composed of men who, while they stand by traditions, are original, and original upon very safe lines; their work is severe and restrained. With regard to the crafts, and he confessed to having a tender place in his heart towards them, the advance is so striking that one cannot help drawing a conclusion therefrom, namely, that English people are really going to be tasteful as well as commercial. If that does happen England will be even greater than she is now. It is a remarkable sign of the times when technical schools are being established all over the country, and a still more interesting fact that the work done is already upon a high level of excellence. He could not help congratulating them—and while he did that, the head-master of the Birmingham School of Art—that he and they moved with the times. It had often passed his lips that the Birmingham School of Art was the best in England—the best because the instruction is not only thorough, but very broad in its outlook. Especially did it interest and delight him to know that the lesser arts found great sympathy in their educational programme. They might take his word for it when he said that the decorative arts, inclusive, would be the event of the future. They would be wise to aid and encourage that movement. And they would do so if they were practical rather than theoretical. Designing for metal, mosaic and pottery was only valuable when the designer knew the capabilities of his material. South Kensington had been a great lesson. The system there had failed to succeed, as it might have succeeded if the original plan had been practical, not theoretical. While the South Kensington authorities had been asleep, some cities, such as Birmingham, and even towns, had become alive to the necessity of training for the crafts, and training for them by practice in them. He confessed that he looked forward to a time—it would not come in his life possibly—when England took her place, not even second to Italy at her best time. That would come when the unity of the arts had been established—when architecture, sculpture and painting were all working together hand in hand with the crafts. It would come when the smallest jewel had been set so exquisitely, and with such exuberance of fancy and finish, that it is prized, not for its intrinsic worth or marketable value, but because it is lovely. When the taste for the beautiful has been fully established in small things, and when people decline to buy ill-made and badly-designed articles or finery, then the great epoch to which he had alluded would commence. It would be a time of a great liberal union—a great federation of all the states of art. They in Birmingham were going the way to attain it. But there was a great deal to be done yet before such an ideal is consummated. Art as a commercial business would have to cease. All labour should be well paid, but the labour which is always a pleasure is often far too highly paid. And those who desired the best must want the best, and they would get it. He could not but think that all who listened to him would feel that the great movement was due in a great measure to the labours of Burne-Jones and William Morris. At that point he could not separate those two friends—even brothers—nor did he think that he in any way exaggerated when he said that what is going on at the present time, which is truly vital and influential, has been in a large measure due to those great artists. So there is, indeed, hope for the future, and, even more than hope, a belief that Englishmen will ere long determine to have all things beautiful as well as useful, and, perhaps—but he would not prophesy—two centuries hence history might say, "Yes, what we know now is due to a few artists of the nineteenth century. There were some great painters in those days, but there were two great designers who opened out their invention for the public good, and gave their best not only to picture galleries, but to our churches and homes and to the people—William Morris and Edward Burne-Jones."

The Wesleyan Centenary Hall which it is proposed to erect in London is estimated to cost 250,000*l*.

THE PARTHENON MARBLES.

AS a memorial of the late Duchess of Leinster a course of lectures is to be delivered annually in the Alexandra School, Dublin. This year Miss J. E. Harrison, D.Litt., LL.D., was selected as lecturer, the subject being, "The Parthenon Marbles in relation to recent Investigations." In the first lecture, according to the *Irish Times*, Miss Harrison said that Hegel held that not to have known the works of the ancients was to have lived without knowing beauty; the study of the work of the ancients was, indeed, necessarily good. Some of them might not have had the opportunity of learning the literary language of the ancient Greeks, and it was of supreme importance. Let them study the originals in the other and simpler kind of language—that of art—and let them begin with the study of the Parthenon marbles. She gave this advice because the Parthenon marbles were the fullest and most characteristic expression of the Greek mind that had been left to them in art; they told what the Greeks felt and how they felt, and how they expressed it at the very apex of the development of their art; and she thought it better to begin at that point and with them, and then to study how it was led up to and how step by step Greek art dwindled away. There was a second reason for their studying the Parthenon marbles which should appeal very strongly to them. These marbles were a national treasure, she might almost say the greatest of their national treasures. They were, as they knew, in the British Museum, where they were very carefully tended by the officials. Savants from all parts of Europe came to study them, and she thought it was part of their business as loyal British subjects to understand something at all events of the work, and of the beauty and meaning of these wonderful sculptures of which they were the guardians. It had been charged that it was almost a sin for them to have these marbles, and Lord Elgin had been called all manner of names because he stripped the Parthenon of them and brought them to England and housed them in the British Museum. Was that charge a just one or not? There was no question Lord Elgin deserved some very small measure of criticism and blame for the way in which he took the marbles away. He was not an archæologist, he could not be in the early part of the century; and when he took them away and stripped them off from the temple, he damaged a good deal of the architecture of the temple in a way in which no man of culture nowadays would dream of doing. But after all they could not ask a man to be in advance of his age, and it seemed to her that Lord Elgin had conferred an inestimable boon not only upon them, but upon all civilised Europe by rescuing these marbles from what was almost practically certain destruction. For what was the modern history of the Parthenon marbles? Athens was taken by the Romans, and when the Romans pillaged what was movable in the temple, so far as they knew, they did not do much destruction to the actual structure. During the long Byzantian period it was fairly safe, but a certain small amount of damage was unquestionably done, because the church of Athena Parthenos the Virgin was turned into the church of Mary the Virgin, but the damage did not appear to have been of a very serious order. In 1453 Constantinople was taken by the Turks, and Athens fell under Turkish rule. Their religion laid upon the Turks the injunction to destroy all embodiments in art of the human form, and how careless they were about protecting the national temple would be shown by one simple fact, that when Venice besieged Athens the Turks turned the Parthenon into a powder magazine, and when a Venetian bomb was thrown into the Acropolis it fell into the Parthenon and the centre of the temple was laid in a mass of ruins. Before that disaster the French Ambassador with the Porte had taken with him an artist, and got him to make a series of drawings of the marbles on the temple, and recent researches had proved these to be more and more accurate, and on them rested their knowledge of the destroyed marbles. The whole of the centre of the western pediment was broken by the Venetian general in the attempt to take them down by means of a crane or some other instrument and to carry them off. Any Turk thought he had a right to pick up fragments of the marbles—to smash up the heads of the heathen idols as he called them—to break up statues and make of them mortar of which to build his house. Such were the dangers to which the Parthenon was exposed, and as any cultivated man would be, Lord Elgin was grieved at heart to see the destruction that was going on. At first he had no intention of removing the marbles bodily; he simply wanted to make certain measurements, to take certain casts and register down certain facts. So disastrous, however, was the destruction that went on that at last he decided to get a firman to remove the sculptures. For that he paid a few dozen yards of scarlet cloth and a hundredweight of coffee, which served to show how little the Turks cared for the treasures in their care. With great difficulty and labour, and with a carelessness that belonged to his time rather than to himself, he took the marbles away. He offered them to the Government, and, a fact which showed that Lord Elgin was not worse than the rest, the Government hesitated long about the buying of the marbles, and they lay in the cellars of Burlington House for many a day. The report of the special committee of the House of Commons was very curious reading, showing very clearly that to those people brought up on meretricious showy sculpture the austere models of the Parthenon seemed lacking in grace and beauty; 35,000*l.* was paid by the Government for them, and it is only fair to say that Lord Elgin was never fully repaid for the money he spent. They were housed in the British Museum in 1816, and it was not until 1821, as a result of the War of Independence, that the Greek came into possession of his own again. The Greeks of the present day took excellent care of their remaining marbles, and it should be mentioned that the recent earthquakes in Greece had so shaken and damaged the Parthenon that it had been found necessary to appoint an archæological commission to undertake the work of careful restoration. She thought, therefore, that they should be thoroughly grateful to Lord Elgin, and should venerate his name for having preserved these marbles from imminent destruction. During recent excavations an older Temple of Athena—in archaic style—had been found close by, and from investigations and study the conclusion was forced upon them that Phidias did not let his creations spring straight from his brain—as some people imagined—but worked carefully and laboriously in the school his predecessors had established for him, and that the Parthenon was the heir to a great artistic tradition. The Parthenon was begun about 447 B.C., and was completed and ready for the reception of the great gold and ivory statue in 438. Its appearance they always identified with the great liberal statesman Pericles. After the great liberal measures of Pericles a reaction ensued, which was marked by the name of Nikias and the building of the Erechtheum. Greek sculpture was mainly significant when it was taken away from the architectural frames in which it was encased, and in its conception the Greeks were always careful to select subjects which, while they were connected by continuity, could nevertheless be broken up into separate groups. The Parthenon was the embodiment of Athens after the great tide of the Persian invasion had been turned back, and in expressing their glory they looked on their history in the light of their mythology, and defeated the barbarian hosts conquered by the Greeks of heroic days. They selected several subjects—the battle of the Olympian gods against the earth-born giants, the battle of the Greeks and Amazons, and the battle of the Lapiths and Centaurs, the former of whom were the ancestors of the ancient Greeks, and the latter primitive hosts of men with whom they had to contend. It was interesting to note that while in the early metopes horizontal and vertical lines were used, in the later metopes, such as those of Phidias enclosing the battle of Lapiths and Centaurs, diagonal lines were beautifully introduced to give rest and relief to the eyes. It was remarkable that in these metopes the Lapiths were sometimes represented as being physically defeated, although of course they ultimately won. The Greeks had no fear that it would be misunderstood, and it enabled the composition to be varied. The battle took place at a wedding feast. The Centaurs could not stand the taste and smell of the wine; it went to their heads. They attacked the guests, and tried to carry off the bride and slay her friends. The series of groups representing this episode was interrupted in the middle by another series of interpolated metopes, and the lecturer was inclined to think that these latter were taken from the older temple, and represented the solemn dedication of the first image of Athena. The Greeks were conservative in matters of art, and if they could they would get a bit of an old temple and carry it over to the new.

In her second lecture Miss Harrison said she had now come to what was, perhaps, the most interesting part of the subject, namely, the question of the great Ionic frieze which surrounded the inner cella of the Parthenon. The condition on which it was erected was quite different from that of the Doric frieze on the outside of the temple. It could not be seen until one came quite close to the building and had climbed the steps immediately beneath it. As a consequence it was not worked in high relief as the metopes of the Doric frieze were, but in quite low relief, and it was easily observable in the British Museum that the upper part of the relief was worked in slightly higher relief than the lower, so that in looking at it, as they must, turning their eyes upwards, the upper part of the relief did not fall out of sight, but overhung the lower a little bit. It was one of the delicacies in the execution of sculpture which was observable in Greek work, and showed that the artist considered in the most perfect manner possible the exact conditions under which his work was to be seen. It had been asked why this matchless work had been so hidden away, and in answering that question they had to remember the position the cella occupied. The cella was the essential part—the inner kernel—the most sacred portion of the temple. A Greek temple was a solid oblong box—the house of the god—intended to contain his image, frequently quite dark, unlighted by windows, and only illuminated by the door. It was almost certain that the Parthenon was only

illuminated through the door. The subject of the frieze was the celebration of the Panathenaic festival of the whole body politic of Athens, gathered together to worship the goddess Athene, which took place on her birthday, late in July. The celebration culminated in a great procession, which wound its way up to the Acropolis, and there the gods and mortals sat down to a banquet together. The Greek idea of sacrifice was a human and genial one—it was always that of a common banquet, to which the gods were invited. Such a feast was called a Theoxena, and they were really the foundation-stones of most Greek festivals. In the frieze the great procession of the body politic of Athens was represented as appearing in the presence of the twelve Olympian gods. At the western end the cavalry—the young horsemen of Athens—the flower of Athenian chivalry, were seen dividing north and south, and overtaking the chariots again, the sacrificial victims, cows and sheep, votive offerings sent by some of the colonies, and so on, and each of these two parts of the procession meet again at the east end. The maidens with the sacrificial vessels come into the presence of the magistrates, and finally enter the presence of the gods, which are divided into two groups, divided again by a central group of people belonging to the procession. Excavations and investigations have shown that the roads famous in antiquity along which such processions passed were extremely narrow. Panathenaic Way was especially so, and it was a matter of surprise how chariots and unruly votive cows were driven along to the Acropolis within such a narrow space. Phidias did not accomplish his idea of the frieze of the Parthenon without having predecessors, for recent discoveries of sculpture at Delphi had disclosed the prototypes of his figures, so that instead of having to conceive the idea as a lesser genius might have done, the great artist was enabled to put forth all his powers in adding grace and beauty to the thought already conceived. The young horsemen were shown coming closer and closer together into serried ranks, growing ever more beautiful as they linked themselves together. After the votive offerings they had the youths carrying the water vessels. In these figures of the young Athenian aristocrats they had typified the Greek virtues of self-sufficiency and great soulness; as in the figures of the maidens also carrying sacrificial vessels they had portrayed the two other Greek virtues of reverence and grace. So that they had here the cardinal virtues of the Greek expressed in sculpture. They were inclined, perhaps, to be a little disappointed with the Greek ideal of their gods. Their idea was a human idea, only a little grander, on a more stately scale, with little advance into the spiritual conception; but they must not ask the virtues of one nature for another, nor should they ask the Greeks to be Christians, which they were certainly not. The maidens were received by the magistrates standing in a group, and it was interesting to note how the magistrates seemed to stem the tumult of the procession before it entered the presence of the gods. First they had Hermes, the messenger of the gods, and then a beautiful group seated together with knees entwined—the goddess Demeter, Dionysius, the wine god, the only one who had a cushion to his seat, and the Thracian god Ares, who was regarded as an outsider, and sat in a casual posture with his hands joined across his knee. Then they had the father of the gods, Zeus, in the head place and with arms to his chair, and close beside his wife Hera, with her attendant maiden, and next Athene, Hephæstus, Poseidon, Apollo, Artemis, the typical maiden goddess, and, last of all, the sitting deities of the Parthenon, Aphrodite attended by the boy god Eros. The Greeks made all their gods creatures like themselves, and all that they could add to their human ideal was a sort of larger circumstance. The actual centre-piece of the frieze consisted of two maidens carrying seats, who were received by a priestess and an elderly man who was receiving a robe from a boy. This was the famous central group about which controversy had raged for years. Now, the Ionic frieze represented a Theoxena—a guest feast given to the gods. It happened that in very important inscriptions which they had they possessed an elaborate account of just such a Theoxena given to the twelve Olympian gods, which said, "Let the images of all the twelve gods be brought in their best clothes, and let the couches be strewed." The lecturer's belief was that this central group contained the preparations for the feast; they had an indication of the bringing of the seats and the bringing of the robe or piece of drapery which was to be strewn for the reception of the gods.

In commencing the third lecture Miss Harrison said she had now reached the consideration of what was, though not the most beautiful, perhaps the most important portion of the Parthenon marbles, namely, the marbles that decorated the pediments. On the western pediment the subject was the contest of rivalry of Athene and Poseidon, while on the eastern pediment there was depicted the birth of Athene, the cardinal dogma of Athenian religion. Whereas in the Ionic frieze they had a narrow strip of sculpture unfurled round the temple, and in the Doric frieze alternate metopes and triglyphs strung like beads around the temple, it was necessary that the triangular space should be filled with some subject which would culminate in the centre, and the interest of which would diminish towards the two angles. Gradually the notion grew up that the centre part of the pediment should contain the principal action, and the remainder the frame of the action, the spectators and persons immediately concerned. The kernel of the whole was always in the centre. In the contest of Athene and Poseidon there was no actual fight—the word which denoted it in Pausanias was more accurately translated rivalry; but the two deities brought their characteristic tokens or gifts—semeia, as they are called—and the people decided which they would have. Poseidon was first of all almost exclusively a fisher god, and held in his hand the trident; but when the fisher folk who worshipped him shifted to Lybia they cultivated horses, and as a god was always made to embody the occupations and character of his people, they adopted the horse for his symbol. There was a fanciful interpretation that the horse of Poseidon typified the white waves of the sea, but that was too poetical a conception for a primitive people. He was the elder of the two divinities, but Athene dispossessed him in the favour of the people, although his cult always continued in the ancient temple of the Erechtheum. The olive, the sacred tree of Athene, was a great source of riches and of beauty to Athens. In the central group of the pediment the two deities were seen displaying their tokens, Athene her olive, Poseidon, with his horse and with his trident, drawing forth from the earth the salt sea spring, and the Athenians were then to decide which had first claim to their worship. It took them back to primitive days, the old god and the new goddess contending for the worship of the land and the cause decided by the primitive inhabitants arranged on either side. They got some idea of the way in which Phidias depicted the episode from a Greek vase painting in the Hermitage, St. Petersburg, in which, with great vigour and probably with considerable likeness to the pediment, the same incident was represented. As spectators, they had Cecrops, the old king of Athens, of whom they were quite sure, and one of his daughters clinging anxiously to her father. Another figure was known as the River God. Of the eastern pediment there was little left. The birth of Athene was the great cardinal doctrine of Athenian religion—it was the dogma which the people developed for themselves, which they did not inherit from anyone, and was not shared by other states. It was therefore the distinctive Athenian dogma. The whole of the centre-piece was absolutely lost—the angle figures they had. Yet they could attempt to reconstruct the centre of the pediment. They had in archaic Greek art many representations of the birth of the goddess, and amongst them one in the British Museum, where Zeus was seen sitting on a splendid seat while straight out of his head came forth the tiny deity, and the Olympian gods were gathered round in astonishment. Certain matters, however, that had come to light proved to demonstration that Phidias did not represent the incident in that way. Zeus was probably seated on his throne, and in front of him was the goddess full grown in her armour—newborn, but immediately after the birth. From the angle figures which they were fortunate enough to possess they could see how beautifully the pediment was composed, how gradually the figures sank away into the angle, some sitting, some recumbent, and what beautiful variety Phidias introduced into his lines. The messenger of the gods was represented coming from the scene with tidings that the birth had been accomplished. There was no doubt about the figures that occupied the angles. They saw two horses' heads rising out of the sea while Helios, the god of the Sun, strained at the reins to check his steeds at the birth of the goddess, and at the other end of the angle the horses of the moon were gently descending into the sea to indicate that Athene was born at the rising of the sun and the setting of the moon. Next to the horses of the Sun was a figure around which controversy had ceaselessly raged. It was usually called Theseus, and was a matchless incarnation of the human male form. But Theseus was quite impossible; he was a late democratic hero, and identified with late political revolutions, and it would have been an absolute anachronism to depict him as being present at the birth of the goddess. Other people had thought the figure that of the mountain god—the incarnation of Olympus itself; but at the time Phidias worked his marbles actual incarnations of mountains and rivers were unusual, and a fifth-century Athenian would not have understood this figure as that of a mountain god at all. The lecturer offered the interpretation that it was the god of universal nature, Pan, who was frequently represented watching the rising of the sun; they had him on a coin reclining in the same attitude as in the Parthenon marbles, and moreover he was very popular in Athens at the time. Of the two figures next to Pan, archæologists gave the beautiful interpretation that they represented the two seasons, or, as the Greeks called them, the hours. In the other pediment they had local conceptions, local gods, local kings or spectators, but here they had depicted the great cosmical powers. All nature waited for the birth of the

goddess. Balancing these, they had the three most beautiful figures of the pediment, known as the "Three Fates." It was natural that the three great sisters should weave the thread at the birth of the goddess. Dr. Waldstein had given another beautiful interpretation. Why should one fate be lying in the lap of the other? Ancient sculptors rarely selected a pose simply to make a graceful composition, and the lecturer quite agreed that an explanation was required. They must have great cosmical powers only present, and it seemed to her that the two views would be combined by taking the figures as representing the "Three Fates" of the three departments of the universe. Urania, the fate of heaven, the fate of the earth, and the fate of the sea. Athene, the goddess for whose birth all creation watched, had a very humble beginning. Her first image was, in fact, a bit of her own sacred olive tree. When her people advanced and became warlike, she put on the guise of a warrior—the high helmet, the great round shield, the spear; but after the Persian war, when peace reigned supreme, and she had no further use for her armour, though she still wore her helmet and ægis, she assumed a less warlike form and carried in her hand the god of victory. Athene was the bringer of victory to the Athenians. So she was the incarnation of every phase of the nation's life. The Greeks modified their conception until Athene was identified with achievement and success, especially success in the athletic games. She was the impersonation of the creative activities of the people—she was the first sculptoress, she made the image of the first woman, Pandora, and what was counted more precious in the lecturer's county, Yorkshire, she made the first horse. This was unfair to Poseidon, who was the horse god, but the greater deities invariably absorbed the lesser and took all their attributes and functions. Athene was the incarnation, in fact, of the principle by which the Athenian people boasted they lived—the principle of pure reason. It had been said that the Greeks were not only people who taught them art, but the power of rational thought. "Greece and her foundations are built below the tide of war; based on the crystalline sea of thought and its eternity."

(*To be concluded.*)

TESSERÆ.

The West Doorway, St. Peter's, Monkwearmouth.

THE most interesting portion of the church at Monkwearmouth is its western end. From this projects a tower evidently of Anglo-Saxon date. This tower has arches on three sides of its lower storey, which were not only walled up, but almost buried in the accumulated earth. In September, 1866, they were excavated, and the western entrance opened out by the local archæological society, with the help of Mr. Johnson, architect, of Newcastle. The side doorways were found to have monolith jambs 6 inches wide on the face, which are notched into a continuous sill and support massive imposts, from which the arch springs, with very bold voussoirs. The western entrance, which is 6 feet 4½ inches to the springing and 4 feet 8½ inches wide, has an arch springing from massive abaci 10½ inches thick, supported by baluster-shafts very similar to those found at Jarrow, two of which occupy the width of the wall on either side, and stand upon jambs each of a long and a short stone, the reveal of which is curiously sculptured with entwined serpents. This is decidedly the most remarkable doorway of this kind yet known. Above the doorway runs a band or string sculptured with animals and edged with the cable mould; at the same time, the two lower storeys of the tower were found to have originally formed a gabled porch, two windows of construction very similar to the side arches above described having been stopped up in the end of the church by the conversion of this porch into a tower. Baluster-shafts have been discovered in the internal jambs of these windows.

Anglo-Saxon Characteristics.

Rude work and rough material, walls mostly of rubble or ragstone, with ashlar at the angles in long and short courses alternately; openings with round or triangular heads sometimes divided by a rude balustrade. Piers plain, square and massive. Windows splayed externally and internally. Rude square blocks of stone in place of capitals and bases. Mouldings generally semi-cylindrical and coarsely chiselled. Corners of buildings square without buttresses.

Correggio.

The excellency of Correggio's manner has justly been admired by all succeeding painters. This manner is in direct opposition to what is called the dry and hard manner which preceded him. His colour and his mode of finishing approach nearer to perfection than those of any other painter: the gliding motion of his outline, and the sweetness with which it melts into the ground; the cleanness and transparency of his colouring, which stop at that exact medium in which the purity and perfection of taste lies, leave nothing to be wished for. Baroccio, though upon the whole one of his most successful imitators, yet sometimes in endeavouring at cleanness or brilliancy of tint overshot the mark, and falls under the criticism that was made on an ancient painter, that his figures looked as if they fed upon roses.

Prejudice in Art.

Prejudice is generally used in a bad sense, to imply a predilection, not founded on reason or nature, in favour of a particular master or a particular manner, and therefore ought to be opposed with all our force, but totally to eradicate in advanced age what has so much assisted us in our youth is a point to which we cannot hope to arrive. The difficulty of conquering this prejudice is to be considered in the number of those causes which makes excellence so very rare. Whoever would make a happy progress in any art or science must begin by having great confidence in, and even prejudice in favour of, his instructor, but to continue to think him infallible would be continuing for ever in a state of infancy. It is impossible to draw a line when the artist shall begin to dare to examine and criticise the works of his master, or of the greatest masterpieces of art; we can only say that his progress to this capacity will be gradual. In proportion as the scholar learns to analyse the excellence of the masters he esteems—in proportion as he comes exactly to distinguish in what that excellence consists, and refer it to some precise rule and fixed standard, in that proportion he becomes free. When he has once laid hold of their principle, he will see when they deviate from it, or fail to come up to it, so that it is in reality through his extreme admiration of, and blind deference to, these masters (without which he never would have employed an intense application to discover the rule and scheme of their works) that he is enabled, if we may use the expression, to emancipate himself, even to get above them, and to become the judge of those of whom he was at first the humble disciple.

Roman London.

It is a very remarkable fact that no architectural remains of Roman London of any importance have ever been discovered. It is not difficult to show that for 200 years the various excavations made within the walls have been under the inspection of competent and anxious inquirers, and yet nothing of any importance has occurred. Beginning with the great excavations of St. Paul's, Sir Christopher Wren was evidently desirous to discover and to care for Roman remains, but nothing was found. Again, he built fifty churches in the Metropolis and repaired many others; but in the course of all the excavations for these buildings we do not hear of any discovery, though Woodward was at hand making his collection and storing it with all the best remains of Roman antiquities disclosed amidst the clays and gravels of Spitalfields, where most of the bricks required for the rebuilding the City were made. It is quite true that Woodward urges Sir Christopher in his letter to publish his notes of what he had found; but the report itself, in the "Parentalia," literally describes nothing but the foundations of a causeway and some Roman remains at Bow Church. The Society of Antiquaries was established in 1718, and in 1747 began to publish the "Vetusta Monumenta"; but in vain do we turn to those volumes, or to the memoirs of the "Archæologia," commenced in 1779, for any notice of important Roman remains of edifices. In the meanwhile the architectural remains at Bath and elsewhere show what has been found in other Roman cities, doubtless then of far greater importance than London, though we have been taught to infer from our present metropolitan importance our former pre-eminent greatness. It may be answered that London was often sacked and burned, but still Roman edifices of stone are not so easily disposed of. In all ages such fragments have been made use of as building materials, and have in the course of time been gradually brought to light. Bath, Gloucester, Cirencester and other places can witness; yet their entire absence in London convinces us that Roman London was a brick city, and, in the words of Tacitus, "a place not dignified with the name of colony, but the chief residence of merchants." As a further confirmation of this opinion the great difficulty of procuring good workable stone at that time must not be forgotten. At Bath the oolite was at hand, and also generally northwards there were equally abundant materials, but for London the same deficiency existed then as now. There was no stone available for building purposes nearer than the oolites of Wiltshire, and in the Roman walls no stone is found but the Kentish ragstone.

The Monastery of Yuste, Estramadura.

From the day when the body of Charles V. quitted Yuste, where his cloister years were lived, the convent and palace were neglected alike by the kings and people of Spain. Left to the gentle keeping of a climate more conservative than man, all might to this day have remained in excellent preservation; but in 1809 a party of Soult's soldiers, flying from Oporto, and

irritated by disgrace, set their mark on these beautiful districts. They clambered up the hill, pillaged and then fired the convent; the royal wing only escaped from the thickness of the walls of the intervening chapel. Under the reign of the Constitution in 1820 such restorations as the brotherhood had been able to effect were unmercifully dealt with by the Liberals. Their ravages were again partially made good when the monks returned on Ferdinand VII.'s recovery of power; but his death was soon followed by the total suppression of the monastic system. Like the rest of their class, the beadsmen of St. Jerome were ejected; the whole edifice speedily fell into irremediable ruin, and chaos is come again. A visitor who described the melancholy scene wrote:—"It was inhabited only by the peasant-bailiff of the lay proprietor, who eked out his wages by showing the historical site to the passing stranger. The principal cloister was choked with the rubbish of the fallen upper storey, the richly carved capitals which had supported it peeping here and there from the soil and the luxuriant mantle of wild shrubs and flowers. Two sides of the smaller and older cloisters were still standing, with blackened walls and rotting floors and ceiling. The strong granite-built church, proof against the fire of the Gaul and the wintry storms of the Sierra, was a hollow shell, the classical decorations of the altars and quaint woodwork having been partly used for fuel, partly carried off to the parish church of Cuacos. Beautiful blue and yellow tiles, which had lined the chancel, were fast dropping from the walls; and above, the window through which the dying glance of Charles had sought the altar remained like the eye-socket in a skull turned towards the damp, blank space that was once bright with holy tapers and the colouring of Titian. In the palace the lower chambers were used as a magazine for fuel, and in the rooms above, where the emperor lived and died, maize and olives were gathered, and the silk-worm wound its cocoons in dust and darkness. His garden below, with its tank and broken fountain, was overgrown with tangled thickets of fig, mulberry and almond, with a few patches of potherbs, and here and there an orange-tree or a cypress, to mark where once the terrace smiled with its blooming parterres."

Tree Coffins.

Among the Anglo-Saxons, indeed, such tribes as practised the rite of inhumation seem for the most part to have committed their dead to the earth in the very simplest form, unprotected by coffin or aught that could delay the work of decay. The sole example of a todten-baum in our own country, therefore, is that of Gristhorpe, in Yorkshire, and this belongs to the Celtic period. But it was not so with the Franks. Round Merovingian graves a black residuum will often be noticed, which might easily be taken for charcoal, but which has been shown by chemical analysis to be formed by decomposition of wood. This residuum is very solid, and, as nails do not appear to be met with, it is most probable that these old Frankish noffi, naufi or sarcophagi were in fact formed from solid trunks of trees. In a Merovingian cemetery discovered just outside the gates of Metz, M. Victor Simon found the marble column of some Roman edifice which had been sawn asunder and hollowed out to receive the remains of a Frankish chieftain, in lieu perchance of the more perishable todten-baum. Herr Lindenschmit also has met with the same circumstance at Mayence. The opinion too finds further confirmation in a remarkable passage in Gregory of Tours relating the cruelty of Rauchingus, a Merovingian noble, who caused two of his slaves to be interred alive for marrying without his consent. It is stated that a tree was cut down for the purpose; the bole was cleft with wedges, and hollowed out to receive the offending lovers. The words "ibique puellam ut mortuam componens" are very significative of the accustomed funeral employment of such a noffus. This was about the middle of the sixth century, and the Christian priest had the coffin exhumed, but too late to save the woman. The word naufus, or noffus, with its many readings and corruptions, which in its primary sense represents tree-burial, appears to be derived from a very ancient Frankish word, nau, meaning a small boat. In the old Gothic the word naus means a corpse. The Sanscrit, again, has the word nau, so used in its uninflected form in composition, but which when inflected becomes in the nominative before certain letters, nau-h, or nau-s, sometimes nau-r, and means a boat or ship. This ancient derivation of naufus, and its close correspondence with what we learn of the old Scandinavian sepulchral rites, is very striking. This derivation stands remarkably in relation with the mysterious fancies of Teuton heathenism as to the wanderings of the soul after death and its passage over the dark waters which encircled the land of spirits. The Scandinavian rovers too seem to have frequently been buried in their vessels, and in the old poem of Beowulf, indeed, we find a hero's corpse placed with all honours in his ship, and so abandoned to the will of the winds and the waves. So too in the Vilkina Saga, Wieland hollows out the stem of a tree, in which he encloses himself and his mystic treasures, and is floated over the sea to another land. Going still further north, we learn from Scheffer that the Laplanders thus buried their dead in the trunks of trees, or these failing, in their sledges.

Roman Concrete Walls.

The chief objection to rubble and concrete walls is the roughness of the surface. The ancient Romans got over the objection in various ways; at first they faced them with the large blocks of tufa, such as had previously been used in the time of the kings (rubble walls only came in with the Republic); afterwards, in the latter days of the Republic and in the early Empire, they faced them with small wedge-shaped blocks of tufa; the square surfaces of those small blocks were placed diamond-wise, resembling in appearance a small net, hence called network, or reticulated work (*opus reticulatum*). Afterwards they used brick or tiles of a triangular shape, with the long surface outwards, and thus these also formed a sort of wedges, but the mortar held them so tight that even if held by the point only the brick or the block of tufa will break before it can be pulled out. The smooth surfaces are then frequently plastered and painted, or covered with marble. In building such a wall the wedge-shaped blocks or tiles were placed in order and filled up with the broken stones to the depth of about a yard before the cement or hot-lime grouting was poured in. The whole was thus bound together in one solid mass, with openings left for doors and windows.

GENERAL.

Mr. W. W. Boyington, of Chicago, lately died in that city. A great many of the buildings erected after the fire were designed by him.

A Collection of drawings of Old Glasgow, which is supposed to be the most complete that can be found, is now on view in the People's Palace of that city. The drawings are mainly by Mr. W. R. Mainds.

The Proprietors of Atholl Crescent and Coates Crescent, Edinburgh, intend to oppose the proposed erection of the Usher Hall near their property.

Mr. G. F. Bodley, A.R.A., has designed the silver casket presented to Lord Kitchener with the certificate of freedom of the Fishmongers' Company.

The Boadicea Group is not likely to be erected on the Thames Embankment as quickly as was intended, for the County Council have been officially informed that the written consent of the Office of Works is necessary before any statue can be erected in London.

The Competitors for the seat of the late M. Lenepveu in the Académie des Beaux-Arts are MM. Cormon, Humbert, François Flameng, Dagnan-Bouveret and probably MM. Albert Maignan and Roybet.

A Bust of Thomas de Quincey, the "English Opium Eater," by Sir John Steell, has been bequeathed to the Scottish National Portrait Gallery by the late Mr. John Ritchie Findlay.

A Memorial of the late Richard M. Hunt, consisting of a granite and marble bench with a bronze bust by D. C. French, has been set up in Central Park, New York.

Andrew Marvell's Cottage in Highgate was taken down a few years ago. It is now proposed to mark the site by a brass tablet fixed to a wall near the site, bearing the following inscription:—"Four feet below this spot is the stone step formerly the entrance to the cottage in which lived Andrew Marvell, some time M.P. for Hull, and Latin under-secretary, patriot, poet, wit and satirist. Born 1620; died 1678. He was buried in St. Giles's-in-the-Fields. This memorial brass was placed here by the London County Council, November 1898."

The Loan Exhibition of Lithographs which has been organised by the Department of Science and Art, at the suggestion of the Society of Arts, to commemorate the centenary of the invention of lithography by Aloys Senefelder in 1798, will be opened on Monday, November 21, and will remain open until February 28 next. The exhibition has been arranged in a building adjoining the machinery section, southern galleries, South Kensington Museum (entrance on the west side of Exhibition Road). The public will be admitted, without payment, at all hours when the Museum is open.

An Examination is being held at Queen's College in the preliminary stage for qualification as Associate of the Royal Institute of British Architects, under the local conduct of the Birmingham Architectural Association, which is an allied branch of the Institute. The holding of the examination in provincial centres is a late departure of the Institute, with the object of enabling local candidates to sit without having to go up to London.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s.; by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

ABERAVON.—Dec. 1.—Plans are invited, with estimated cost, for the extension of the covered market. A premium of twenty guineas will be awarded to the architect whose plans shall be selected. Mr. Jas. Roderick, borough surveyor, Aberavon.

BRADFORD.—Jan. 2.—Designs are invited for erection of a central fire-brigade station. Three premiums are offered, viz. 100*l.*, 50*l.* and 30*l.* Mr. George McGuire, town clerk, Bradford.

BURNLEY.—Jan. 14.—The Burnley School Board invite designs for a new higher-grade school and pupil-teachers' centre, to be erected in Ormerod Road, Burnley. Competition is limited to architects having offices within 60 miles of Burnley. Mr. E. Jones, clerk, Town Hall, Burnley.

HARROGATE.—Jan. 2.—Competitive designs are invited for erection of a pump-room, &c., the cost of which must not exceed 8,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* Mr. Samuel Stead, borough surveyor, Municipal Offices, Harrogate.

HULL.—Jan. 1.—Designs are invited in competition for a central public library in Albion Street. Premiums 50*l.*, 30*l.* and 20*l.* Mr. Sidney R. J. Smith, 14 York Buildings, Adelphi, W.C.

CONTRACTS OPEN.

ARBROATH.—Nov. 14.—For erection of a post office. Mr. George Morham, 39 George Street, Edinburgh.

ALLERTON.—For erection of nine houses at Avenel Terrace. Mr. R. Drake, architect, 142 Allerton Road, Allerton.

BAILDON.—Nov. 30.—For erection of a country house, stabling, lodge, drainage, roadmaking, &c. Messrs. Isitt, Adkin & Hill, architects, Prudential Buildings, Bradford.

BARNSLEY.—Nov. 14.—For additions and alterations at the Malt Shovel inn, Darton. Messrs. Wade & Turner, architects, 10 Pitt Street, Barnsley.

BARNSLEY.—Nov. 17.—For erection of an additional wing to the infants' school, Lamb Lane, Monk Bretton. Messrs. Wade & Turner, architects, 10 Pitt Street, Barnsley.

BARRASFORD.—Nov. 18.—For alterations and additions to the parochial schools. Messrs. Armstrong & Knowles, 38 Grainger Street, Newcastle-on-Tyne.

BEXLEY.—Nov. 14.—For erection of fourteen shelters in the airing courts at the Heath Asylum. The Clerk of the Committee, L.C.C., 21 Whitehall Place, London, S.W.

BIRKENHEAD.—Nov. 14.—For erection of public baths in Corporation Street and Prince Street. Mr. Charles Brownridge, borough engineer, Town Hall, Birkenhead.

BLACKBURN.—Nov. 16.—For alterations of and additions to the present conveniences at No. 1 Market House. Mr. William Stubbs, borough and water engineer, Municipal Offices, Victoria Street, Blackburn.

BRADFORD.—Nov. 15.—For erection of stabling, &c., for seventeen horses at Gordon Street Dyeworks. Messrs. Joshua Robertshaw & Son, architects, 55 Tyrrel Street, Bradford.

BRIDGEND.—Nov. 24.—For erection of a chapel at Parc Gwyllt Asylum. Messrs. Giles, Gough & Trollope, architects, 23 Craven Street, Charing Cross.

BURTONWOOD.—Nov. 16.—For erection of boundary walls, gates and bierhouse, and the formation of walks and the drainage of proposed burial-ground. Messrs. William & Segar Owen, architects, Warrington.

BUSHEY.—Nov. 23.—For enlargement of the new Bushey Board school, Chalk Hill. Mr. W. H. Syme, 4 High Street, Watford.

CARDIFF.—Nov. 15.—For erection of a fish market and offices at the Hayes. Mr. W. Harpur, borough engineer, Town Hall, Cardiff.

CARDIFF.—Nov. 16.—For alteration and renovation of the borough treasurer's offices. Mr. J. L. Wheatley, town clerk, Town Hall, Cardiff.

CARLISLE.—For plastering of five houses in Beaconsfield Street. Mrs. Roper, 5 Alton Street, Currock Road, Carlisle.

STURTEVANT SYSTEM
OF WARMING AND VENTILATING.
POSITIVE CIRCULATION OF PURE WARM AIR. NO RISK OF FIRE.
PERFECT CONTROL OF TEMPERATURE.
STURTEVANT ENGINEERING CO., 75 QUEEN VICTORIA ST., LONDON.

CARMARTHEN.—Nov. 18.—For erection of a stone bridge of three arches and approaches thereto over the river Towy at Drysllwyn. Mr. Thomas Codrington, Shire Hall, Carmarthen.

CORK.—Nov. 14—For erection of offices for the Cork Electric Tramway and Lighting Co., adjoining the power-house, Albert Street. Mr. Robert Walker, architect, 17 South Mall, Cork.

DRIFFIELD.—Nov. 17.—For erection of the new church of St. John's. Messrs. Hicks & Charlewood, architects, Driffield.

DULWICH.—Dec. 1.—For additions and alterations to the school premises, East Dulwich Grove. Mr. Arthur J. Gale, architect, 4 Serjeants' Inn, Fleet Street, E.C.

ELGIN.—Nov. 22.—For erection of a hotel. Mr. Geo. Sunderland, 51 High Street, Rothes.

FULHAM.—Nov. 22.—For erection of a laundry receiving room at the Western Hospital, Seagrove Road. Messrs. A. & C. Harston, architects, 15 Leadenhall Street, E.C.

HASTINGS.—Nov. 21.—For additions and alterations and sanitary works at Hollington Boys' school. Mr. Arthur Wells, architect, Queen's Chambers, Hastings.

HASTINGS.—Dec. 2.—For erection of coastguard buildings, consisting of quarters for an officer and thirteen men, &c. Director of Works Department, Admiralty, 21 Northumberland Avenue, W.C.

HERTFORD.—Nov. 25.—For erection of additional vagrant wards at workhouse. Mr. Russell Austin, 13 Villiers Street, Hertford.

HOLBROOK.—Nov. 16.—For works at Holbrook schools. Mr. Edward Fernley Bisshop, architect, 32 Museum Street, Ipswich.

IRELAND.—Nov. 14.—For alterations and additions to a house near Lisburn. Messrs. Graeme-Watt & Tulloch, architects, 77A Victoria Street, Belfast.

IRELAND.—Nov. 17.—For repairs at the dispensary residence at Mill Street. Mr. Daniel J. O'Connor, Mill Street.

IRELAND.—Nov. 28.—For extension and improvement of the infirmary, steam cooking apparatus and laundry improvements, new sewers and water-closets. Mr. James Perry, county surveyor, Galway.

KINGSTON-UPON-THAMES.—Nov. 19.—For erection of cottage in Portland Road. Mr. Vincent Davison, Bartley Lodge, New Malden.

KNUTSFORD.—Nov. 16.—For erection of temporary fever hospital at workhouse. Mr. Robert J. M'Beath, architect, Birnam House, Sale.

LANCASTER.—Nov. 19.—For erection of small-pox hospital on Lancaster Marsh estate. Mr. T. Cann Hughes, town clerk Town Hall, Lancaster.

LEEDS.—For building square chimney 45 yards high at the Kirkstall Brick Company, Limited, Canal Side, Kirkstall, near Leeds.

LEEDS.—Nov. 19.—For erection of United Methodist Free Church chapel, at Armley. Messrs. Walter Hanstock & Son, architects, Branch Road, Batley.

LONDON.—Nov. 15.—For erection of public conveniences at Blackwall Tunnel (north side), for the London County Council. Particulars at the Architect's Department, General Branch, 13 Spring Gardens, S.W.

LONDONDERRY.—Nov. 16.—For erection of new factory, Foyle Road. Mr. Daniel Conroy, architect, 2 Bishop Street, Derry.

LONGWOOD (HUDDERSFIELD).—Nov. 16.—For erection of a villa residence, Botham Hall Road. Mr. J. Berry, architect, 9 Queen Street, Huddersfield.

MARYPORT.—Nov. 18.—For pulling-down and rebuilding the Victoria Vaults and Royal Oak inn. Mr. Chas. Eaglesfield, architect, Maryport.

MORECAMBE.—Nov. 17.—For erection of four houses in Fairfield Road, Sandylands. Mr. James Hartley, architect, Exchange Buildings, Skipton.

MORECAMBE.—For erection of hotel, Regent Road. Messrs. Harrison, Hall & Moore, 36 Albert Road, Morecambe, W.

NOTTINGHAM.—For erection of business premises, &c., at Lenton. Messrs. F. Ball & Lamb, architects, 23 King Street Nottingham.

OLDHAM.—Nov. 22.—For enlargement of the Oldham post office, for the Commissioners of H.M. Works and Public Buildings. Mr. J. Flew, 11 Popplewell Chambers, Market Street, Bradford.

PADDINGTON.—Nov. 15.—For erection of a coroner's court building at Manor Place. Architect's Department, L.C.C., 13 Spring Gardens, S.W.

THE SUNBURY **LINCRUSTA-WALTON** WALL DECORATION.

TRADE NOTES.

THE new Art Schools, Bury St. Edmunds, are being warmed and ventilated by means of Shorland's patent Manchester grates, by Messrs. E. H. Shorland & Brother, of Manchester.

MR. H. PARRY, of Tunnel Works, Kirton Lindsay, informs us that owing to ill-health he has decided to incorporate his business into a private limited company consisting entirely of members of his family, and that it will in future be conducted as before, but under the style of H. Parry & Sons, Limited.

A FIRE broke out late on the 7th inst. on the premises of Messrs. Lavender & Sons, builders, Manor Street, Clapham. A range of buildings used as workshops and stores became involved, but several engines arrived, and the firemen set to work vigorously. About midnight the main structures had been burned out, and commenced to collapse with loud crashes. The work of the brigade was thus much simplified. The fire, however, was not subdued until the morning had considerably advanced, and then Messrs. Lavender's premises had been completely burned out and had fallen down.

VARIETIES.

THE closing night of the season at the Alexandra Palace was a great success, the attendance being 27,145. The Palace will reopen for a week's carnival at Christmas, and next season will commence at Easter.

A LARGE estate at King's Lynn, upon which eighty-one houses are now in course of erection, has been named the Khartoum Estate, and two streets running through it Kitchener Street and Fashoda Street.

THE Mausoleum at Friedrichsruh, in which the remains of the late Prince Bismarck are to be laid on Sunday, the 27th inst., has now been roofed and plastered, but the cupola is still unfinished, and the internal decorations and the embellishment of the grounds will not be complete till the spring.

ST. MARY'S Roman Catholic church, Moorfields, is wanted for railway purposes, and the handsome sum of 200,000*l.* has been offered for it. Although some of the authorities are quite willing and anxious to close with such a desirable bargain, there is a determined section who are very much opposed to selling the church for secular purposes.

THE school recently completed for Rutherglen School Board at Eastfield is now open. It was built to accommodate 604 children at a cost of 7,500*l.*, which included the whole o the ground belonging to the Board.

AT a meeting of the members of the Grimsby Corporation, convened by the mayor (Mr. J. Sutcliffe) a committee, consisting of the mayor, Ald. Doughty, M.P., and a few prominent townspeople, was appointed to wait on the town clerk (Mr. L. Grange) to ask him to accept the honorary freedom of the borough and also an oil-painting of himself, which they purposed to have executed. It is understood that Mr. Grange, who has occupied the position of town clerk of Grimsby for about fifty years, refused a similar honour some time ago.

A CURIOUS residence has been erected at Yokohama by an eminent German bacteriologist. It is a microbe-proof house, built of glass blocks. There are no window-sashes, and the doors, when closed, are air-tight. The air-supply is forced into the room through a pipe and filtered through cotton-wool to cleanse it of bacteria. To insure further sterilisation the air is driven against a glycerine-coated plate-glass, which captures all the microbes the wool spares. The few microbes brought into the house in the clothes of visitors soon die in the warm sunlight with which the house is flooded.

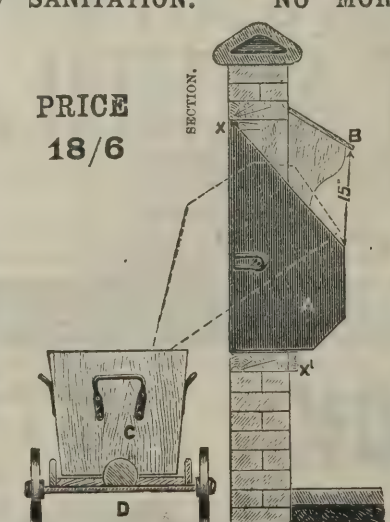
THE projected removal of the famous Ponte Vecchio, or Old Bridge of Florence, the only one now left of any importance, with its Mediæval houses lining either side of it, is creating a great stir in the artistic world, both in Italy and the rest of Europe. A committee has been formed for the "Protection of Old Florence," which includes amongst its members the most illustrious Florentine names, and a circular has been sent out to all parts of Europe soliciting signatures against this act of vandalism.

THE opening meeting of the Northern Architectural Association will be held at the meeting-room of the Art Gallery, Newcastle-upon-Tyne, on Wednesday next, November 16, at 7.30 P.M., when the president, Mr. Frank W. Rich, will deliver his inaugural address.

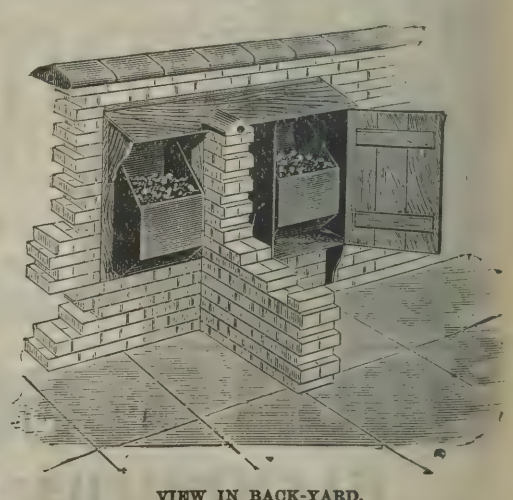
ON Saturday afternoon the ceremony of dedicating St. Hilda's chapel-of-ease, Hunt's Cross, Woolton, was performed by the Bishop of Liverpool (Dr. Ryle). The new chapel, which has been erected close to the Hunt's Cross station, is a well-planned, well-constructed little building capable of seating about 150 persons. It is built of terra-cotta brick in the Early English style, and is neatly and comfortably finished as to the interior.

AT Penrhyn on the 3rd inst. the Mayor and Corporation of the borough entertained Mr. G. A. Jenkins to a complimentary banquet in the Town Hall, to commemorate his jubilee as town clerk. The gathering included the leading inhabitants of the town, several councillors from Falmouth, the town clerk of Truro, and county magistrates and officials. As a permanent memento of their good wishes the gathering presented the guest of the evening with a silver service, a cathedral clock and ornaments, and an address on vellum.

TRACES of Roman occupation, of great interest to archæologists, are from time to time brought to light in Belgium. The latest discovery is the remains of a Roman cemetery in the neighbourhood of Namur, where about twenty tombs have been unearthed, together with a quantity of coins, vases and flint tools of various descriptions. A subterranean passage has also been discovered leading from the cemetery to the ancient village of Villers, formerly a Gallo-Roman station.



AN examination of master and operative plumbers applying for registration under the National Registration of Plumbers was held on Saturday by the Worshipful Company of Plumbers at King's College. Twenty-one candidates presented themselves for examination from various parts of London; also from Cambridge, Carmarthen, Guildford, Maidstone, Ramsgate, Windsor and Worthing. The tests in workmanship included lead-bossing, pipe bending and joint making, and the examination questions included the subjects of roof covering, contamination of drinking water from faulty connections, arrangement of bath, sink and closet wastes, drainage of town houses and disconnection with sewers. Nine succeeded in passing the examination in practical workmanship.



AT the meeting of the Metropolitan Asylums Board, Mr. A. C. Scovell brought up a report of the works committee recommending that the following clause relative to the stipulations to be observed by contractors as to rates of wages of workmen be inserted in all contracts entered into by the managers, viz.:—"The contractor shall on all work executed for the managers pay the rates of wages and observe the hours of labour agreed upon by the association of employers and the representatives of the workmen; but in the case of any trade where no such agreement exists, then the rate of wages and the hours of labour must be those current in the district where the work is executed." After a lengthy discussion the recommendation was agreed to.

ST. BRIDGET'S CHURCH, Wavertree, was reopened for divine service on Sunday last. Consequent on a fall of plaster from the roof, the necessity for closing the church for repairs was realised. While an expensive scaffolding was erected the clergy and congregation determined to proceed with the internal decoration, which has for years been contemplated. Messrs. G. H. Morton & Son, Bold Street, Liverpool, were instructed to prepare a decorative scheme in harmony with the Byzantine character of the building. This beautiful drawing has been much admired in the Walker Art Gallery, but the cost of the elaborate work was prohibitive. It was decided to abandon practically all the ornamentation, mosaic and figure painting and revert to a scheme wherein the broad line of the original colour composition might be introduced, thus forming the basis of the more elaborate decoration which may be undertaken in sections as funds permit. This conception has been successfully carried out by Messrs. Morton. The colour scheme, consisting of the richest tones of red, blue and gold colours (each brilliant in hue), is by artistic application rendered thoroughly harmonious, pleasant and beautiful to the eye. All the enriched plaster-work of the ceiling and walls, the arches, pilasters and panels in the nave and aisles have been effectively

emphasised by the decorative artist. The apse, having a red base and pilasters of the same colour, rises to a deep celestial blue in the semitone, upon which there is placed a constellation in gold. The fine mosaic figure of the Lord's Supper, after Leonardo da Vinci, which cost about 750*l.*, gains by its new colour surroundings.

A NEW parish-room and caretaker's cottage adjoining St. Mark's parish church, St. Helens, Lancs., was opened on the 20th ult. The building, which has cost 1,600*l.*, is the Jubilee gift of Sir David to the parish of St. Mark. In addition to the cost of the building the hon. baronet has given the land, comprising an area of 520 yards, and has supplied the furniture. The buildings are of red brick with stone dressings, and comprise an assembly-room 40 feet by 30 feet, with wood-block floor, and a dado, of glazed brick 4 feet 6 inches high. The place is heated, as is also the waiting-room, by hot-water pipes. The main entrance is from North Road, at the south-west corner of the assembly-room, another door being situated at the east end to the right of the platform and leading into the vestibule. The caretaker's cottage, divided from the west end of the assembly-room, is spacious, and has every domestic requisite. The architect of the building is Mr. James Gandy, and the contractor Mr. Peter Tickle.

NEW swimming-baths have lately been opened in East Hull. The building is a brick structure, and adjoins the Reckitt Library, in Holderness Road. The front elevation is an artistic treatment of red brick and terra-cotta, which harmonises with the architecture of the adjoining library. There is a large swimming-bath 96 feet by 30 feet, with 3 feet 9 inches to 6 feet 6 inches of water; a boys' bath 60 feet by 30 feet, with 3 feet 6 inches to 4 feet 6 inches of water; nine ladies' slipper-baths (one with immersion bath attached) and ten men's first-class baths and twelve men's second-class baths. The large swimming-bath occupies a position at the back, and is excellent in its design and construction, possessing a semicircular roof of iron and glass. A gallery for spectators runs over the dressing-boxes, and provision has been made for turning the room into a meeting hall in the winter. The boys' bath, behind the library, is built on the same plan, only the dressing-rooms are open recesses. The boiler-house and laundry stand between the swimming-baths, whilst the waiting-rooms face the slipper-baths in the central corridor. The slipper-baths are arranged in short corridors, and are all fitted up with the best conveniences, hot and cold showers and the like. The manager's house, which completes the equipment, is over the front part of the building. The plans of the building were prepared by the city engineer, Mr. A. White, and the assistant engineer, Mr. Bricknell, and under their supervision the work has been carried out. The premises have cost about 15,000*l.*

A NEW Liberal club was opened in Birkenhead on the 3rd inst. The elevation to Claughton Road is faced with red Ruabon brick, variety of colour being obtained by the plentiful use of cream-coloured terra-cotta. The principal entrance from Claughton Road opens into a hall 15 feet by 12 feet, the floor of which is laid with encaustic tiling. On the right are the secretary's office, principal staircase and refreshment bar. On the left the reading-room (17 feet by 13 feet), and at the end the billiard-room (40 feet by 25 feet), fitted with three first-class tables by Mr. James Ashcroft, of Liverpool. Beyond the billiard-room are situated the gentlemen's toilet-room, a committee-room with separate entrance from Greenfield Street, and a secondary fireproof staircase, giving access to green-rooms, &c. A mezzanine floor at the rear of the building contains a ladies' toilet-room and a cooking kitchen. The entire first floor is occupied by the lecture-hall, with its stage and two green-rooms. The lecture-hall is a spacious and lofty room, and will accommodate about 400 persons. The stage and the green-rooms communicate with the hall and the secondary staircase, and are provided with fireproof floors. From the lecture-hall access can be obtained to a small balcony, which, with its central window, forms an agreeable feature of the front elevation. Adjoining the club buildings, and communicating with the same at the rear, is a residence for the keeper. The buildings have been carried out from the designs of Mr. Thomas Cook, architect, Liverpool, the contractor being Mr. Peter Rothwell, Claughton Road, Birkenhead.

THE new wing of the Upton County Lunatic Asylum, Cheshire, was opened last week. The enormous dimensions of the new structure may be imagined from the fact that its corridors and subways measure about 2 miles. It contains eight and a half million bricks. The establishment has 1,250 windows and a spacious dining-hall, 100 feet by 60 feet, with accommodation for 1,000, and a stage at one end, so that in addition to serving as a dining apartment it will be admirably suited to the purposes of entertainments, dances and other events of a social character. Altogether the new wing will accommodate 404 patients, and the complete and costly internal equipment makes it one of the finest buildings of the kind in the country. There are eight wards. Every apartment is completely furnished, the whole place is lighted with electricity generated on the premises,

22 & 23 SOHO SQUARE, LONDON, W.

there is an ample water supply, and as a protection against an outbreak of fire there are a fire-escape and ninety-two hydrants fitted with Shone's patent nozzles. The buildings are faced with Edwards's Ruabon bricks. Messrs. Doulton & Co. have supplied the sanitary fittings. The extension is costing 90,000*l.*, but deducting from that half the cost of the administrative block and apportioning it to the old wing of the institution, it is said that the cost per bed works out at 187*l.*, and that is lower than the cost per bed of any other institution in the country of a similar character. The architects have been Messrs. Grayson & Ould, Liverpool and Chester, and the builders Messrs. Jones & Son, Liverpool.

THE completion of the restoration of Chester Town Hall, after the fire which occurred there in March, 1897, has been celebrated. The council chamber was thoroughly gutted in the fire all the old pitchpine panelling and roof being burnt. The Council decided to restore it, and placed the work in the hands of Messrs. T. M. Lockwood & Sons, architects, of this city. The committee decided that the new Council chamber panelling should be carried out in oak. The original design has not been adhered to. The new panelling is 10 feet in height, pierced in several places for handsome brass open panels, behind which and hidden from view the hot-water coils are placed, while at top of this panelling is a richly-carved oak frieze. The frieze at the top of the room is carried out in fibrous plaster specially modelled and designed and picked out in colour. The roof is formed with No. 4 principals, partly showing below the ceiling line and the cove around the room in the ceiling has a very pleasing effect, besides being better for acoustic purposes. The ceiling itself is panelled out by oak ribs. The gallery front is very handsomely treated, with oak panelling underneath, and an open front with turned oak balusters. In the centre is a clock, presented by his worship the mayor (Mr. J. Gooddie Holmes), with an inscription underneath showing the date of the fire and restoration of the room, with the names of the mayor and sheriff at those times. The two handsome stone chimneypieces at either side of the entrance from staircase are carried out in Caen stone, very handsomely carved and worked, and within are two brass dog grates. Above these chimneypieces are oak overmantels carved with the arms of the city of Chester and the Earl of Chester in the centre panels. The furniture of the room has been specially made and designed, the seats of the Mayor, ex-Mayor and town clerk being raised above the aldermen and councillors on a dais. The general contractor for the whole work was Mr. Wm. W. Freeman; the carving and modelling was executed by Mr. Geo. Tyrrell, the furniture by Messrs. Lamont & Son, and the whole was designed and under the superintendence of Messrs. T. M. Lockwood & Sons, architects, of this city.

ELECTRIC NOTES.

THE Whitechapel District Board have purchased a site in Osborn Street, Whitechapel, at a cost of 18,250*l.*, for use as an electric-lighting station.

HIGH WYCOMBE has had an experience similar to that of several districts in London in the early days of electric lighting, an explosion having occurred in the mains, with much consequent inconvenience in the shape of extinguished lamps and alarms of fire.

AT a recent meeting of the Paisley Town Council it was reported by the electric-lighting committee that at a special meeting the Provost stated that he had had the meeting convened from his having been impressed, when recently visiting the works, with the desirability of acquiring additional ground for future extensions. He explained the probable future requirements of the works, and, after consideration, it was agreed, on the motion of Councillor Eadie, seconded by Bailie Robertson, that negotiations be opened with Sir Michael Shaw Stewart for the acquisition of from two to three acres of ground to the east of the works. It was remitted to the Provost and Councillor Fisher to communicate with Sir Michael's factor and report.

LAST week a successful trial was made of the electric-light installation which is being completed at the works of Messrs. Alexander Cowan & Sons, Limited, papermakers, Valleyfield, Penicuik. Several years have elapsed since the electric light was first made use of in certain departments at Valleyfield Mills, but a few months ago it was resolved to have a new and complete installation over the whole works. The contract was given to Messrs. Lowdon, Dundee and Edinburgh, who have carried it out successfully; and the installation, while surpassed by some jute mills, is understood to be the largest in any paper-making works in Scotland. An engine of 100 horse-power furnishes power through the medium of patent Brush clutches to three shunt wound continuous run dynamos, two of which are 140 amperes each and the third of 80 amperes. The dynamos can be worked up to 250 volts. Upon the switchboard are placed twelve switches directing the current to as

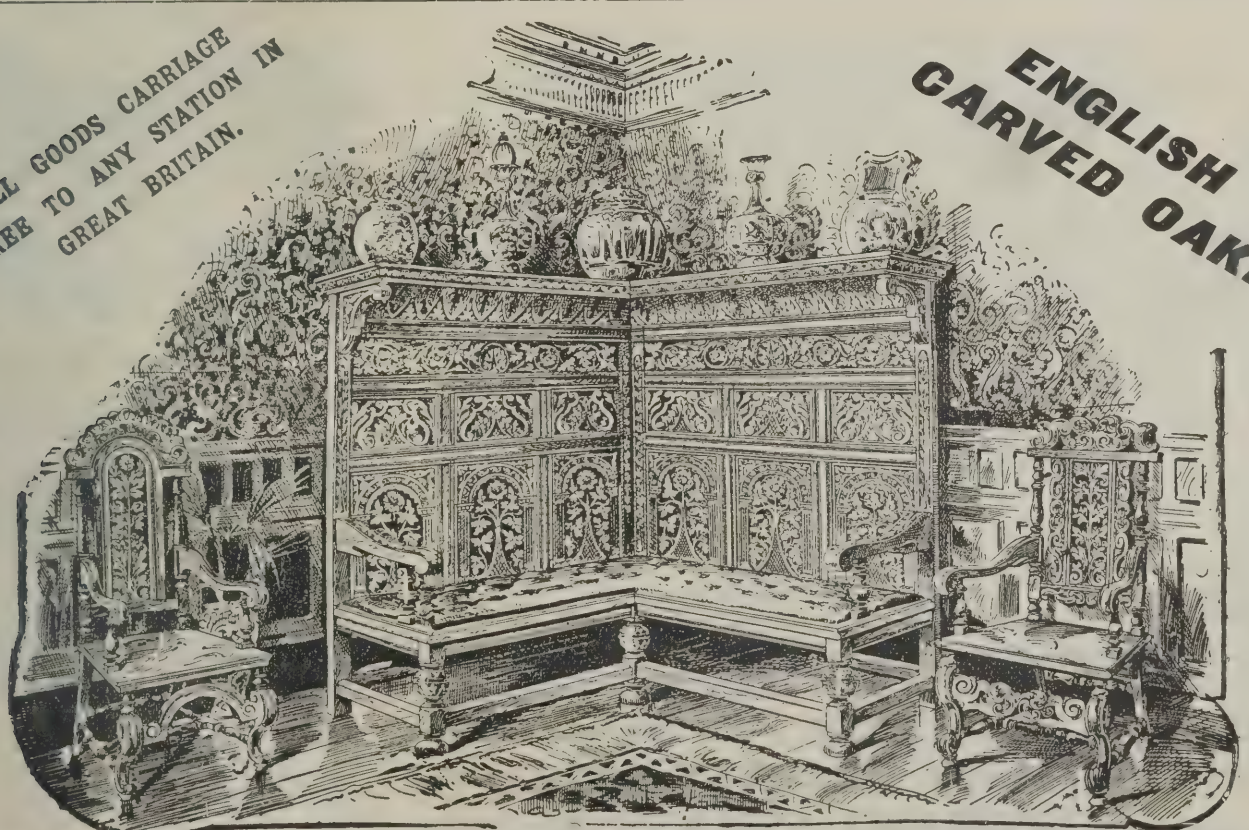
many sections of the mills. The lighting is effected by means of thirty-six arc lamps of 2,000 candle-power each, and close upon 1,000 incandescent lamps of from 16 to 50 candle-power.

AN inquiry was held at Cheltenham on the 4th inst. by Lieutenant-Colonel A. E. Smith, R.E., inspector under the Local Government Board, into an application by the Town Council for sanction to a loan of 17,200*l.* for the purposes of electric lighting. The town clerk stated that the amount borrowed up to date was 68,152*l.* In consequence of the demand for the light further extensions were necessary, hence the present application. The deputy-mayor (Alderman Norman) said that in 1895-96 47,700 units were sold, the gross receipts being 1,050*l.*; in the following year the figures were 90,300 units and 2,040*l.*; in the next, 140,600 units and 3,215*l.*; and a moderate estimate for the current year gave 204,200 units and 5,020*l.* as the receipts. After allowing rebates and for the street lighting, he put the receipts for the current year at 6,600*l.* net, as compared with 971*l.* net in the first year. The first year's trading result was a deficit of 622*l.*; in the following year there was a surplus on the working expenses to go to the sinking fund of 54*l.*; in the next year the surplus was 1,262*l.*, and he put the figure this year at 3,300*l.*, which was sufficient to pay the whole of the interest and the annual amount required for sinking fund to pay off loans. Mr. Hamilton Kilgour, borough electrician, gave other particulars, and, there being no opposition, the inquiry closed.

AUTOMATIC FLUSHING.

THAT the waste water from a sink might be utilised as a means of flushing the pan of a closet is but to state a self-evident truth. Everything of course depends on the system under which the feat is accomplished or attempted. Messrs. S. Dibble & Son, of 30 Ledsam Street, Birmingham, appear to have done the former by means of a patented apparatus which the inventors have called the Sink and Automatic Waste-water Flushing Closet.

The principle of this device is very simple. The waste water from the scullery sink passes through the usual perforated trap into a receiver, which is called the "tipper"—for a reason which will be presently apparent. This receiver is swung on a pivot, and is so arranged that when it has been charged with a certain quantity of waste water—usually three gallons—the weight of that water causes the receiver to "tip" and discharge its contents. This it does through an open



channel into a trapped gully, whence it is conveyed—or rather passes—to the closet pan, which it flushes in the usual way.

From this arrangement several advantages flow. To begin with, a closet-pan is always clean and sealed; no chain or other pull is required. Then there is little risk of injury from frost, as hot water is of course constantly passed through the scullery sink. Further, there is a considerable reduction in the amount of sewerage passing into the drain, while the saving of the fresh water used is enormous. This would be a most important consideration where water is used by meter. Moreover, as there are no cisterns or lead pipes, there is not only a saving of expense in that direction, but, as the inventors justly point out "there are no unsightly and ever-running overflow pipes to cause damp, and no crumbling walls to be everlastingly painted up and repaired."

Such is the principle of Messrs. Dibble's most ingenious and useful system—a system which, as our readers do not require to be told, could be adapted in different ways to suit different conditions of construction. That the system is one worthy of the attention of architects there can be no doubt whatever.

BUILDING AND BUILDERS.

A PLOT of ground in West Street, Boston, 280 yards in extent, has been purchased by the Boston Free Library committee for the purpose of erecting thereon a free library and reading-room, the price paid being 280*l.* The committee have decided to offer prizes for the most suitable plan for the new institution.

ALL the bricklayers employed by the Battersea Vestry have come out on strike, alleging that their privileges were being encroached upon by labourers, who laid drain-pipes at the Central Library.

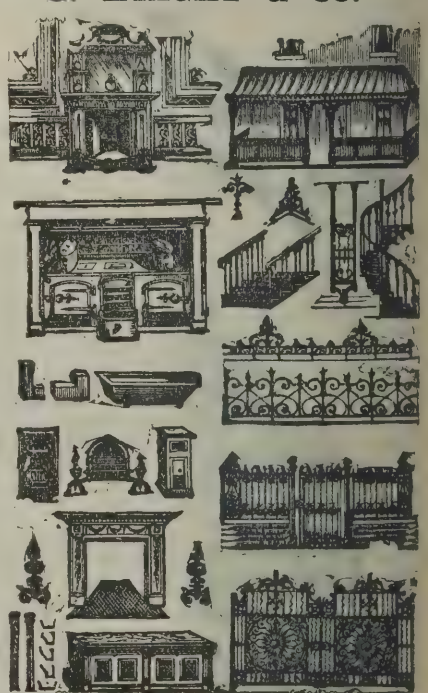
A LABOURER named John Burke, who was employed on some buildings in course of erection in Alton Road, Tuebrook, was admitted on Monday to the Mill Road Hospital suffering from injuries sustained by a fall. He was carrying a hod of bricks up to a scaffold, and on arriving on the platform he by some means slipped and fell backwards to the ground, alighting on his head. He appeared to be badly injured, and on examination it was found that he had received two deep gashes on the head, a badly injured spine, and it is feared a fractured skull.

THE opening of the new Baptist chapel in Adnitt Road, Monk's Park, Northampton, has been fixed for Thursday, January 19, next year. The chapel is being erected by Mr. A. J. Chown, from designs by Messrs. Mosley & Anderson, architects, on a site in Adnitt Road exactly opposite Allen Road, while the school, on an adjoining site, will have a frontage to Lea Road. About 400 persons may be seated in the chapel, which has a floor space of 75 feet by 42 feet, and forty will be accommodated in the choir gallery.

A SERIOUS scaffold accident occurred on Monday afternoon at a house in course of erection in New Road, Nantwich. Four men—Thomas Lloyd, Roland Ankers, Gabriel Tilley, bricklayers, and Arthur Austin, labourer—were working on a scaffold 20 feet high, when it suddenly collapsed, precipitating the men to the ground. Austin was rendered insensible, and received injuries to the legs and arms, Ankers sustained a severe shaking and a sprained ankle, while Lloyd and Tilley were cut and bruised. The men had a marvellous escape, especially Lloyd, who fell head first.

THE foundation-stone has been laid of a church at the corner of Villa Road and Mansfield Road, Liverpool, to be erected from designs by Messrs. Brewill & Bailey. The freehold site cost 3,400*l.* in all, and the architects estimate that 4,500*l.* will cover the expense of erecting the church. It is to be built in the Late Gothic style of architecture, with Derbyshire stone, and will accommodate about 520 people. There is a suggestion of providing a lecture hall and schools adjoining, but for the present that remains in abeyance, and one of the villas will serve for awhile as the home of the church's organisations. The builder, Mr. Thomas Cuthbert, has already made considerable progress with the work, which is to be completed by May 31 next.

THE plans which the Caledonian Railway Company are preparing in connection with their scheme for the extension of the Central Station, Glasgow, provide for the inclusion of all the property between Argyll Street and the Clyde as far as a line drawn southward in continuation of the east side of Hope Street. The company already own all the property on that side of Hope Street with the exception of St. Columba's Established Church, and their property there will also be included in the station. These extensions also include the erection of a bridge across the Clyde, which will be twice the breadth of the existing one, a bridge across Ann Street and a bridge across Argyll Street, which will be a continuation westward of the present bridge, and one and a half times its breadth.



AT a special meeting of Aberdeen Harbour Board on the 27th ult., Lord Provost Mearns presiding, the works committee recommended that in the Bill for which the commissioners are to apply in the ensuing session of Parliament power should be taken to borrow for the purposes of the harbour, including the reconstruction of the graving dock, the sum of 200,000*l.* Amongst the works which Mr. Gordon Nicol, the engineer, considers it might be desirable to undertake during the next ten years are:—Deepening the navigation channel to 30 feet at high water of spring tides, including the removal of rock, 54,000*l.*; deepening the Albert Basin, tidal harbour, river Dee and dock, 9,000*l.*; improvement of Pocra harbour, 9,500*l.*; improvement of Point Law, 17,000*l.*; improvement of river Dee, 13,000*l.*; reconstruction of part of Provost Blaikie's quay, 12,000*l.*; reconstruction of part of Provost Matthews's quay, 2,500*l.*; reconstruction of goods sheds, new houses for officials and extension of workshops, 4,500*l.*; strengthening the quays for steam haulage, 1,800*l.*; extension and renewal of rails, 16,000*l.*; causewaying of roads and quays, 12,000*l.*; hydraulic machinery for lock gates, 2,800*l.*; new cranes and steel-yards, 5,500*l.*; electric-light fittings for buildings and sheds, 11,000*l.*; additions to plant, 14,000*l.*; contingent allowance for repairs to sea works, 6,000*l.*; engineering expenses, 7,000*l.*;

new sea lock, 40,000*l.*—total amount, 227,700*l.* Shoremaster Meff moved the adoption of the report, and explained that before carrying out the reconstruction of the graving dock they had to ascertain their financial position, and they found that they would have to go to Parliament for borrowing powers. Before doing so the engineer had been asked to report, stating what schemes he considered it would be necessary to carry out within the next ten years, and the probable cost. Many of the suggested works would require to be carried out within the next few years, and others might be allowed to lie over for a time. They must go to Parliament for borrowing powers to the extent of 200,000*l.*, but it would not be necessary for them to spend all this money, though it was necessary to state in the Bill in detail the work for which the money was required. Mr. J. S. Smith seconded. Bailie Taylor moved as an amendment that the Board seek borrowing powers for only 150,000*l.*, and this was seconded by Dean of Guild Walker. The report was carried by twenty votes to two. The finance committee were empowered to proceed with the Bill.

THE CROWN THEATRE, PECKHAM.

In the description which we gave in our last week's issue of Mr. Runtz's latest achievement we omitted to mention that the complete and even elaborate electric lighting, with the handsome fittings for the auditorium, were put in by Messrs. Strode & Co., of Osnaburgh Street; the locks and door furniture by Messrs. Hobbs, Hart & Co.; the constructional ironwork by Messrs. Dennett & Ingle. The plaster-work was executed by Messrs. C. Jackson & Sons, and Messrs. Doulton were responsible for the terra-cotta, which enters largely into the scheme of decoration.

THE "SAMSON" SASH-LINE.

Inferior or defective sash-lines are the cause not only of great annoyance, inconvenience and damage, but not infrequently of serious personal injury. Thus the sash-lines which bear the above title, and for which Messrs. W. E. Peck & Co., of Bradford Avenue, London, are the wholesale agents, may be usefully commended to the notice of our readers.

As we need hardly point out, the strain on any cord over a pulley is greater than any other, and this strain is in the ordinary sash-line met by the outside surface rather than by the inner substance of the material. In the "Samson" sash-cord the resistance is very much greater, inasmuch as the strands double on each other, and running through close to the centre, form one homogeneous whole, which offers the same resistance throughout.

The makers of this sash-cord aver that it is even superior to the best metals, chains and tapes, and there is good reason to accept the statement. Anyhow, a very slight examination is quite sufficient to establish the fact that the "Samson" Special-braided Cotton Sash-line is well named, in that it is greatly superior in strength and durability to any twisted, cable-laid or hollow-braided line.

THE HOOLEY ESTATES.

The Pillar Hall, Cannon Street Hotel, was crowded yesterday afternoon, when Messrs. Douglas Young & Co., of 51 Coleman Street, offered the Wiltshire and Essex estates forming part of the assets of Mr. E. T. Hooley. The extensive property in Wiltshire, comprising numerous farms, model villages, &c., was put up in one lot, and after a spirited competition knocked down to Sir Christopher Furness for 98,000*l.* The Essex estate, consisting of a manor-house, farm holdings, &c., and carrying an important advowson with it, fetched 39,500*l.*, and a small separate property known as Finchingfield went for only 250*l.*

PUBLIC WORKS IN EGYPT.

The correspondent of the *Times* in Cairo sends the following summary of the report for 1897 of Sir W. E. Garstin, K.C.M.G., Under-Secretary for Public Works, upon the Irrigation Department.

Although the Nile flood was a poor one and late in arrival, causing some loss of crops, the development of the irrigation system in Upper and Middle Egypt limited the area of actually unwatered land to less than 10,000 acres. The experiment of permanent rotations for the distribution of water in Lower Egypt, which was first introduced in 1896, has proved a marked success, as by alternately raising and lowering the water surface in the canals during fixed periods the surplus water supply is reduced throughout the year, and consequently the evils caused by infiltration and water-logging of land are diminished, whilst with less water turned into the drainage

MAW & CO. *will forward their Pattern Books, or Special Designs, with Estimates for every kind of Wall and Floor Tiling, on application. Patterns can also be seen and particulars obtained at the Showrooms of their appointed Agents,*

Messrs. W. B. SIMPSON & SONS, 99 St. Martin's Lane, W.C.

canals the latter discharge their functions more efficiently. Whilst permanent rotations are applied to counteract the disadvantages of an excess supply, temporary rotations are put into force whenever during the summer months the canals furnish a scant supply necessitating an economical use of water and its equitable distribution amongst cultivators. These are now alive to the benefits of both systems, and the rich or powerful landowner is precluded from monopolising the water supply to the detriment of his poorer neighbours.

Treating of the chief crop, viz. cotton, which, of course, owes its steady and rapid increase to the extension and improvement of the irrigation system, the report shows that this crop, which in 1888 produced 2,700,000 cantars (1 cantar = 98 lbs.), yielded 6,500,000 cantars in 1897, but unfortunately the average price, which was piastres 272·5 (55*s.* 11*d.*) per cantar in the former year, fell to piastres 162·97 (33*s.* 5*d.*) in the latter—the lowest recorded during the ten years.

The sugar crop planted in 1897 yielded 1,330,000 cantars as against 1,740,000 cantars in 1896, a diminution attributable to the winter of 1897-98 having been the coldest experienced in Egypt for many years. The prolonged low temperature lasting from October to February besides causing serious damage to the cane plants materially diminished their yield of sugar.

Much hardship was inflicted on the fellaheen by the failure of the maize crop, their staple food, owing to a caterpillar which destroyed large areas, especially where the sowing was late.

Referring to the gauges established on the Victoria Nyanza, Sir William Garstin regrets that, owing to the insurrection in that region, no information respecting the lake level had been received since the end of July 1897. At that date the water surface of the lake stood some 4 inches higher than at the same period of the previous year.

The hope is expressed that steps will again be taken to observe the daily water surface in this lake, and the urgent need to Egypt of a gauge on the Albert Nyanza is indicated. Gauges were fixed in the Nile at Kerma and Merawi, the third and fourth cataracts, and it is intended to place them also at Berber and at the junction of the Atbara with the Nile.

The department spent 295,000*l.* on drainage works, of which sum 256,000*l.* were given by the Caisse de la Dette as a special credit, and the Caisse granted a further amount of 261,000*l.* to be expended in 1898. The report, alluding to the vital importance of good drainage, states as a well-known fact that to prevent deterioration of the land every drop of water turned on to it for irrigation, minus the quantity evaporated by the sun's heat, should be carried off by drainage.

The usual annual item of 400,000*l.* appears under the heading of expenditure for relief from forced labour, and 21,000*l.* were spent on agricultural roads, of which nearly 1,100 miles are now existent throughout Egypt, and the native provincial councils are continually voting large sums for extensions.

The important work of consolidating the Barrage, for which experiments had been made in 1896, was undertaken on an extended scale, and by the end of the year the cavities under every pier of the Rosetta branch had been filled up with pure cement grout. Five holes were drilled in each pier, extending from the surface of the roadway to well below the lowest depth of the foundations, and into each one of them, 348 in all, and averaging 54 feet in length, pure cement grout was poured until no more would run in. No pressure was applied beyond that exerted by the weight of the column of grout, which, as was found by experiment, balanced a column of water of twice its own height. This pressure, with the water surface in the river standing at metres 13·50, was 26 tons per square metre, or 2·4 tons per square foot, and must undoubtedly have forced the liquid cement into the cavities in every direction in which travel was possible. The total cost of the work was only 3,130*l.*, and it is hoped that by the end of 1898 the Damietta branch of the Barrage will be similarly consolidated. But as the most effectual way of rendering the Barrage perfectly safe would be to reduce permanently the head of water which it has to hold up during low Nile two supplementary dams down stream—one on each branch of the river—were planned, a project rendered feasible by the Caisse de la Dette having granted 543,000*l.*, and it is hoped that the work will be completed by the summer of 1901.

The design of the weirs may be described as a core of rubble masonry in cement sunk well below the river bed and protected up and down stream by a long slope of rough stone blocks or pitching. The masonry core will be rendered watertight by a mass of clay puddle upon either side of it, and the weight of the pitching upon this puddle will tend to compress it and prevent the passage of any springs through or under the work. The weirs are so designed that the head of water on the Barrage, which during times of greatest pressure amounts to 4 metres, shall become reduced so as not to exceed 2½ metres.

The great Nile reservoir, for which the contract was signed in February 1898, had previously been the object of much

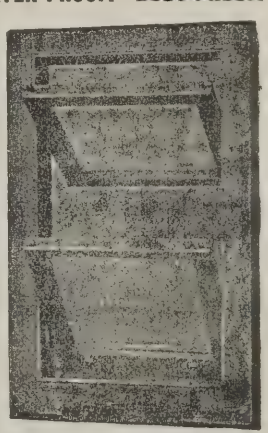
preparatory work in 1897. It is described as a dam and reservoir at Assuan, which will hold up water to R.L. 106 metres, or 20 metres above the present low summer supply, and is calculated by Mr. Willcocks to contain 1,065 million cubic metres. In addition a Barrage is to be constructed at Assiut which will raise the river level so as to increase the discharge into the important Ibrahimieh canal. The benefits of summer irrigation will thus be given to the basin lands in the provinces of Assiut-Minieh and Beni-sue, whilst summer irrigation in the Fayum will be extended. The provinces south of Assiut will benefit from the extra water supply as new pumping stations on the Nile will be permitted and an increase in the cultivation of sugar cane and other valuable crops be rendered possible. The province of Gizeh and Lower Egypt will gain as it is proposed to erect in the former large pumps on the Nile, and the latter will have an assured summer supply, whilst any surplus water will be available towards reclaiming new lands in the northern portions of the Delta. It has been judged best so to distribute the water that all parts of the Nile Valley may participate to a greater or less degree in the benefits resulting from an increased water supply.

Sir William Garstin terminates this subject by saying that it is chiefly due to the energy and talents of Mr. Willcocks, who designed the dam and Barrage, that Egypt will in five years' time be endowed with such a magnificent gift, and expresses regret that, owing to Mr. Willcocks's retirement from the irrigation service, he cannot supervise the construction of the dams and thus put the crown upon the colossal scheme which he originated.

The geological survey commenced in October 1896, and directed by Captain Lyons, R.E., has covered 70,000 square kilometres. A difficulty is encountered from the circumstance that there are no maps available upon which geology can be directly plotted. The topographical features have to be sketched in when a few points have been fixed by plane table triangulation, and the route traversed by day is checked by astronomical observations for latitude and time at night. Consequently each surveyor has to be taught the work and methods of observing before joining a party. Another hindrance is that the work is to terminate at Midsummer 1899, and consequently the surveyors, after acquiring some ability, seek more permanent employment elsewhere. Out of seven surveyors three resigned during the year. Captain Lyons states that there exists throughout the Delta and Nile Valley, as far south certainly as Esneh, a thick deposit of water-bearing sands at a depth of about 50 feet below the surface. A collection of 5,000 specimens of rocks and fossils has been made and awaits a place where they can be arranged and exhibited.

The well-known Khalig canal, which ran from the Nile through the heart of Cairo and which had become a mere open sewer, has been filled up, preparatory to an electric tramway being laid along its course. Major Brown, C.M.G., in his report on the irrigation of Lower Egypt, contributes a very interesting historical and obituary notice of the canal, which for over 1,000 years was annually the subject of one of the greatest popular festivals at the periods when the embankment was cut to admit the flood-water of the Nile.



Referring to the licensing and inspection of steam-engines in the towns, the report speaks unfavourably, but states that this is entirely due to the action of the Mixed Tribunals, who, when the new law was submitted for their approval, so altered the wording of its clauses as to render it practically unworkable. Proprietors of engines can defy the Government with impunity and may keep them in as bad a state as they please, risking no severer punishment than a fine of ten piastres.

THE CITY HALL, BELFAST.

At an adjourned meeting of the Belfast Corporation on the 2nd inst., the town clerk stated that the minutes of a special meeting of the improvement committee included several letters from Mr. J. W. Gamble, clerk of works, concerning the manner in which the building operations at the new City Hall were being carried out, and finding serious fault with several matters concerning piling and concreting. With regard to these Mr. John Martin and Mr. H. Martin, jun., attended before the improvement committee on October 28, and stated that they had heard of Mr. Gamble's report, and they had come at once to put themselves right with the committee, as the statements contained in Mr. Gamble's letter, of which they had been shown a copy since they came, in some cases required explanation and in others contradiction. They assured the committee that the clerk of works' statement regarding the alleged dummy piles was not true, and explained that under certain circumstances short lengths of piles were necessary and allowed owing to the impossibility of driving piles of the full specified length past the strata of rock present in portions of the site, and that in some cases where piles, apparently sound, when being driven into the ground broke owing to soft places in the piles,

these were cut off, left on the ground and sound piles driven beside them—but that dummy piles were driven designedly was false, and they had their superintendent pile driver in attendance should the committee desire to question him. Messrs. Martin stated that at the commencement of the work they had assured the clerk of works that they were anxious to carry it out as specified, and that he had only to point out anything he noticed out of order and they would have it made right. They also stated they were being kept back and interfered with, so that the contract at the present rate of progress would take from ten to fifteen years to complete. Messrs. Martin having retired, Mr. Gamble, clerk of works, was questioned as to their statements, and he reaffirmed his report in every particular, and in reply to a question stated that the two piles he referred to were still in the ground, and that the committee could have them drawn, as they were not concreted over, and it was resolved that the surveyor and clerk of works be instructed to have these piles drawn and report to the committee as to whether they were dummy piles as reported or otherwise; and it was also resolved that any instructions to the clerk of works from the architect relative to variations in the specification be made in writing and reported to this committee.

The city hall committee reported:—During the present month the committee has held several meetings, and at one of these meetings the architect, Mr. Thomas, was present. Having carefully considered the matter of raising the ground around building so as to form a gentle slope outwards from the same, and also having learned that such was originally intended by the committee having charge of the competitive designs (although omitted to be included in the contract drawings), we are unanimously of opinion that the height of building should be increased 2 feet for this purpose, and that two additional steps be added to all entrances. This will increase the height of elevation 3 feet, and as 2 feet of the added height will be below the ground line, the cost of the work will be less than if they were over it. From the book of drawings supplied to each member of the Council it will be observed that the contract provides for facing the courtyard or quadrangle with brickwork. This, we believe, would be a serious mistake, as the courtyard must of necessity be considered a special feature of the building, and as such would warrant the expenditure of an additional sum in substituting stone for brick. The cost of doing so cannot be very great, seeing that all moulded and ornamental stonework around doors and windows of courtyard is already provided by the contract. We, therefore, recommend it, and have given instructions for an estimate of the cost to be provided for your information. The only emergency staircase from public hall mentioned in the contract has been taken away by reason of the altered projection in elevation to Donegall Square North. We feel that not to provide a suitable and necessary exit is wholly inconsistent with our dealings with the public in exacting similar erections, and we recommend that the staircase shown on the contract drawings (but afterwards eliminated) be again put back in its original or other position. From a careful reading of the specification we are forced to the conclusion that the work is not adequately described, its clauses are not sufficiently binding, and its provisions are, in some instances, for work very little removed from ordinary domestic buildings—notably that for rafters of roof, which are described as 4½ inches by 2½ inches and 15 inches apart. Several items of extra work have been done (the steel girdering, concreting and piling in foundations of dome, for instance) without the knowledge of the Council or your committee. As extra works are likely to arise very frequently throughout the work, we recommend that it be an instruction to the architect not to order any such work or any variations in the specification without first obtaining sanction of your committee. We do not consider the prime cost allowances in specification as satisfactory, either as to the amounts allowed or to the method of expending them. Before any such sums are expended it should be for you to see that estimates are obtained for the several works, and that the same are carried out to your orders. In this connection we may mention that all attendance upon, and materials required by the several specialists (with the exception of a small sum for heating engineer) in carrying out their works, together with all jobbing work incidental to the completion of each trade, is to be paid as extra work. This is most unsatisfactory. No provision had been made in the plans for a waiting-room in connection with the improvement committee room. This is an error which must be remedied, and to which we have directed the attention of your architect.

In a letter dated October 5 the architect (Mr. A. B. Bramwell Thomas) wrote in regard to these matters that, having provided the clerk of works with the necessary assistance, it will now be to his personal discredit for irregularities to occur, and it may safely be presumed they will not occur in future.

IT IS WORTH SPECIFYING.

CASES FOR BINDING THE ARCHITECT.
Price Two Shillings.—Office: 175 Strand, London, W.C.

At a special meeting of the improvement committee on October 31 it was resolved that the following recommendations of the sub-committee be approved of and sent to the Council for confirmation :—"That as in carrying out of the contract for the erection of the City Hall additional outlay is likely to be required for additions which the Council may desire to make on the plans, and for extras, also for furnishing the hall, and without binding the Council as to details thereof, the sub-committee recommend that powers be taken in the Bill to borrow 30,000*l.* in addition to the 150,000*l.* already authorised for these purposes."

The following letter was also read :—"7 Queen Anne's Gate, S.W.: October 31, 1898.—Dear Sir,—In pursuance of the resolution of the city hall committee, that I should report to them as to the desirability of making the alterations which have been considered—(1) Raising the building 3 feet and the ground about the building 2 feet, so that an extra foot in height will appear above ground ; (2) stone facing to courtyard ; (3) the provision of two emergency staircases to the public hall—I have to report that in the event of the committee being able to recommend the additional expense, the alterations are, in my opinion, improvements. I should mention that these alterations would cause no modification to the present foundations, which are adequate to support the increased weight of the building consequent upon the raising of the structure.—I am, A. B. THOMAS."

After a long discussion, it was decided to obtain powers to borrow the money required.

ENGINEERS' WAGES AT SHEFFIELD.

A FULLY attended meeting of the Sheffield and District Engineering Trades Employers' Association was held on Friday to consider a letter received from the workmen. It may be remembered that the men asked for an advance of 2*s.* per week and a reduction of one hour in their time. The employers offered an advance of 1*s.* per week and no change in the hours. This offer the men refused to accept. At the meeting of employers on Friday they instructed their secretary, Mr. Norris Henry Deakin, to reply to the letter of the men, expressing regret that the offer had not been accepted. The letter proceeds :—"Having regard to the fact that the suggested alteration in hours cannot be dealt with locally, the employers feel that the only course is to refer the whole question to our respective executives, and ask them to meet, in order to obtain a settlement mutually satisfactory at the earliest possible moment. Knowing that the joint boards referred to meet in London next Thursday to consider other matters, our association feels that a prompt reference to them on the Sheffield questions would bring about a satisfactory settlement during next week, and have no doubt that this course will commend itself to your members." He asks the secretary of the men's societies to let him know as early as possible whether they adopt the suggestion, so that he may make the necessary arrangements.

SOCIETY OF ENGINEERS.

AT a meeting of the Society of Engineers, held at the Royal United Service Institution, Whitehall, on Monday evening, November 7, Mr. W. Worby Beaumont, president, in the chair, a paper was read by Mr. Perry F. Nursey, past president, entitled "The Preparation of Rhea Fibre for Textile Purposes."

In introducing the subject the author referred to the amount of time, trouble and money that had been expended in developing the practical application of rhea fibre for textile purposes, which fibre was the longest and strongest in nature. He had followed the subject for the past sixteen years, during which time he had professionally investigated and reported upon several systems, both mechanical and chemical. After describing the rhea plant, and the method of its cultivation, the author observed that the history of the endeavours to utilise its fibre extended back to the beginning of the present century. It was introduced into Calcutta in 1803, and was brought to England in 1814 by Captain J. Cotton, to whom the Society of Arts awarded a gold medal. In 1840 the Government of India for a second time offered a prize for a successful method of preparing the fibre, the prize having been first offered in 1803. No practical result, however, followed upon either occasion. In 1869 the Indian Government offered another prize of 5,000*l.*, a portion of which was awarded to a partially successful competitor. The prize was again offered in 1881, but the offer proved barren of practical results. The matter also received the careful attention of the fibre judges at the Great Exhibition of 1851, who reported on rhea fibre at some length.

The first decorticating process examined by the author was that of M. Favier, in 1882. The rhea stems were steamed, and the bark with the contained fibre stripped off by hand. The

author then described the Frémy-Urbain chemical process, the working of which he had several times investigated in France, the result proving very satisfactory, an excellent filasse being produced. He then referred to the opinion of the late Sir Joseph Lee, who had investigated the Frémy-Urbain process with the author. Sir Joseph's opinion was that that process was a great step in advance, but that the question depended for ultimate solution upon suitable machinery. The Frémy process, however, did not prove a commercial success. M. Favier devised a fibre-preparing machine, which stood in the same category. The Casper system was next noticed, in which machinery was dispensed with, and only a weak solution of caustic soda was used. The fibre-extracting machines invented respectively by Messrs. H. C. Smith, W. E. Death and J. Orr Wallace were then noticed, after which the author described the system of Mr. Henry Ferguson, which he had inspected in operation at Brighouse in 1896. This is a chemical process, the rhea ribbons being subjected to treatment, first in an alkaline solution and subsequently in an oleaginous bath. The filasse produced was being spun into yarns in the same mill. The author then described the Burrows-Radclyffe system, which he inspected in operation at Wraysbury, near Staines. Decortication is there effected mechanically, the subsequent treatment being chemical. At the time of the author's inspection in 1896 yarns were being produced from the filasse prepared in the mill, and the process is said to be still working satisfactorily.

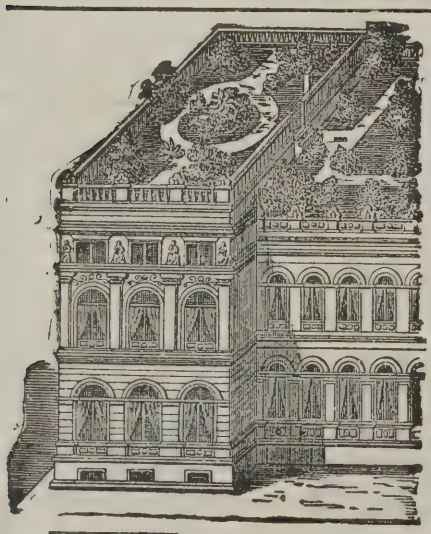
The Gomez, the Macdonald-Boyle and the Eyssen processes were only referred to in passing, the author having been unable to obtain particulars of either of those systems. In conclusion, he observed that the preparation of rhea fibre for the spinner had advanced somewhat, albeit very slowly, and he expressed the opinion that the solution of the problem would be found in a combination of mechanical and chemical processes, chemistry stepping in as the handmaid of mechanics.

THE HOLBORN TO STRAND IMPROVEMENT.

A JOINT report for presentation to the London County Council has been prepared by the improvements and housing of the working classes committees respecting the Holborn to Strand and Clare Market scheme. The following recommendations are made :—

(*a*) That, having regard to the nature, extent and importance of the Holborn to Strand improvement and to the special circumstances connected with the case, the improvements committee shall, notwithstanding existing references to the committees, be charged with the clearance and laying out of all property comprised in the Clare Market scheme and of the whole area between Holborn and the Strand, the sites agreed by the two committees to be set apart for working-class dwellings being subsequently handed over to the housing committee.

(*b*) That the housing committee do supply information to the improvements committee as to any negotiations now on foot for the purchase of any property on the Clare Market area.



(*c*) That it be referred to the finance committee to make any necessary rearrangement of the accounts between the two committees.

(*d*) That the improvements committee do consult the housing committee when formulating any street improvement which would appear to involve a scheme for rehousing the persons of the labouring class to be displaced, or when preparing for submission to the Home Secretary any rehousing scheme in connection with a street improvement sanctioned by Parliament and undertaken by the Council.

MARKET EXTENSION AT DEPTFORD.

THE City Corporation having obtained an Act of Parliament authorising it to extend considerably the Foreign Cattle Market at Deptford and connect it by means of a railway with the London, Brighton and South Coast Railway, the work, which will involve an expenditure of 100,000*l.*, will be carried out without delay. The services of Sir J. Wolfe Barry have been secured as engineer, and from a report he has made it would appear that the railway and tramway outside the market will cost 32,250*l.* For the purpose of extending the market, property in the near vicinity will be bought up at a cost of 22,000*l.* Increased accommodation will be also provided in the shape of additional slaughter-houses, cooling-rooms, increased lairage and an extended river frontage. The estimated outlay on these works are as follows :—Slaughter-houses (a first instalment), 5,000*l.* ; lairage, 21,000*l.* ; a junction of the three jetties (providing a continuous river frontage of 880 feet), 16,000*l.* ; and property required, 22,000*l.* The extension of the market has been rendered necessary owing to the great pressure which has

PATENT
VULCANITE ROOFING

Since the introduction of the patent Vulcanite Roofing into this country it has been adopt by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospita Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summ than under any other roof. When properly laid repairs are never required, and all roofs guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGE TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower a quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and f SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 sup ficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing ; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD
OLD FORD, BOW, LONDON, E.

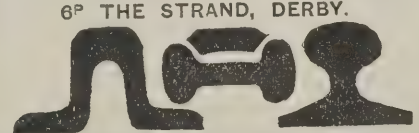
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

been put upon the existing accommodation. The business increases every month, no fewer than 510,618 animals being slaughtered there during last year. The financial position of the market is satisfactory, as, although the loan account at one time reached a total sum of 424,000*l.*, the amount outstanding at the close of last year was only 21,000*l.*

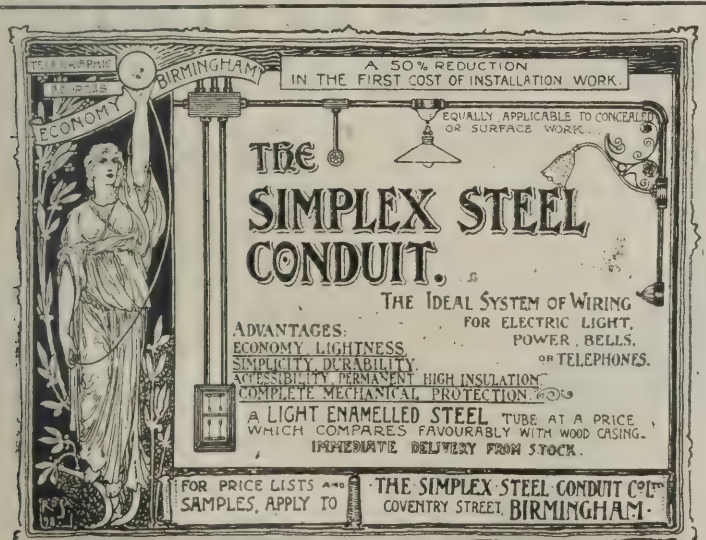
THE EDINBURGH BUILDING TRADES EXCHANGE.

THE first annual meeting of the shareholders of the Edinburgh Building Trades Exchange was held in the rooms at Shandwick Place on the 26th ult., Mr. Peter Lawrence, surveyor, chairman of the company, presiding. The chairman said the venture was a new one, and it had so far proved very satisfactory, as it had enabled them to pay a dividend of 5 per cent. That did not exhaust their resources, because they had a lucrative source of income from the catalogue which was being prepared, and which would enable them to pay a larger dividend next year. The Exchange was founded to weld together the different branches of the building trade and the manufacturers. They had learned their lessons from America, not directly, but through Glasgow, where an exchange was started on most successful principles. Since then exchanges had been formed in Newcastle and Halifax, and he believed that in the course of time all the other great building centres in the country would see that it was to their advantage to have a place like theirs, where the builders could meet together with the manufacturers and discuss matters in which they were interested. The membership was increasing, and what they desired was that the members should take advantage of the rooms provided for them in their present premises in order to interchange views. In olden times there used to be hole-and-corner work among builders, but that had disappeared, and they wanted to meet and consider what wages they should pay their men, and what prices should be given for their work. The directors had also under consideration the question of insurance, in view of the Employers' Liability Act, and it had been remitted to a committee to consider whether a federation of the building trades in Scotland, or in Edinburgh, could not be formed for the purpose of insuring themselves against accidents.

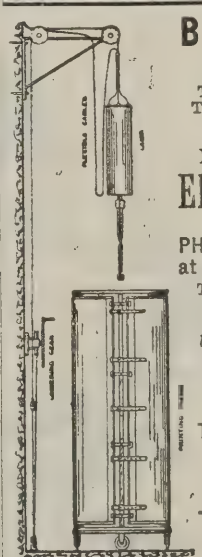
Sir Thomas Gibson-Carmichael, M.P., hon. president of the Association, in moving the adoption of the report, said the Exchange had done a great deal to fulfil the ideals with which it started. It was a most useful institution to the trade of Edinburgh, and he trusted it might become of even greater use in the future.



Mr. Colin Macandrew seconded the motion, which was unanimously agreed to. Directors were afterwards appointed.



SANITARY INSPECTORS' ASSOCIATION.



AN extraordinary general meeting of this Association was held on Saturday evening at Carpenters' Hall, London Wall, Mr. T. J. M. Flower, the newly-elected chairman of council, presiding. Mr. E. Tidman (hon. secretary) announced that the council had met that afternoon and appointed a committee to consider the general financial position of the Association. They would probably be able to present their report at the next meeting. With regard to the discussion which took place recently on the balance-sheet, he said it was felt that some misunderstanding was likely to result, and it had therefore been decided to publish a letter pointing out that the Association was far from being on the verge of bankruptcy, as had been suggested. As a matter of fact, they had 3,000*l.* invested. Mr. Foote stated that one-sixth of their income last year was expended on travelling expenses, and, after criticising other items in the balance-sheet, he contended that if they went on at the same rate as at present the Association would very soon be bankrupt. Further debate on the balance-sheet was adjourned to the usual private members' conference. The Chairman then delivered his inaugural address, in the course of which he gave an account of the origin and growth of the Association. In 1883-84, he said, their income was 92*l.*, and their total membership 171, while in 1897-98 the figures were 631*l.* and 668 respectively. He strongly advocated the amalgamation of the different sanitary associations in the United Kingdom, and said if they set about it in the right way success would attend any efforts they might make to obtain

such a result. It was the earnest wish of them all, he believed, that there should be one organisation representing the whole of the sanitary inspectors in the country. Speaking of their finances, he remarked that it was absurd to suppose that they were nearing bankruptcy, having regard to their invested funds. The Association was doing all in its power to obtain for sanitary inspectors a respectable superannuation allowance, and he hoped that the Bill promoted with this object would in the near future pass through Parliament. Security of tenure was another matter of great importance, and the council had been working to bring about the desired change. It was only right that sanitary inspectors should be placed in a position which would enable them to fearlessly discharge their duties, undeterred by property-owners who were members of local boards. A short discussion followed.

THE GLASGOW BUILDING TRADES EXCHANGE.

THE fourth annual meeting of the building trades of the city and district of Glasgow was held on the 26th ult. in the rooms of the Exchange, Colonel Bennett presiding. The secretary read the annual report by the executive. The past year, it said, had been successful. The income had been 822*l.* 3*s.* 1*d.* and the expenditure 672*l.* 12*s.* 7*d.*, leaving a net credit balance on the year's working of 149*l.* 10*s.* 6*d.*, from which a 5 per cent. dividend would be paid. During the year the membership had increased by thirty-four. The directors were considering suggestions that refreshments should be supplied in the Exchange rooms, as in other exchanges, and that a good service of news should be got. With reference to the Workmen's Compensation Act, the questions of forming a company and of getting specially low terms from insurance companies had been discussed, and it was decided to wait at least a year in order to see the nature of the risks to be faced.

The Chairman moved the adoption of the report. Mr. Shaw seconded.

Mr. Goldie expressed himself as against a license being procured for the premises. He also called attention to what he called the severe punishment builders had to submit to by measurers. They might perhaps finish a job which had been going on for years and they could not get their money for months. They grumbled individually, but that would do no good; the Exchange should take the matter up.

The Secretary said the matter had been before the executive, and a conference had been invited of delegates from the various masters' associations.

The Chairman said that the hanging up of measurements for three, six, twelve and eighteen months was beyond a joke. He thought there ought to be a clause in contracts allowing them 5 per cent. after three months from the finish of a contract. The report was adopted and the executive, office-bearers, auditors, officials, &c., were re-elected.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

APPLICATIONS FOR PATENTS.

22327. Hugh Stanton, for "Improvements in fire-resisting floors for buildings."

22480. John Webster, John Thomas Woodhouse and Herbert Foster Worrall, for "An improved brick for building purposes."

22485. William Henry Johnson, for "Improvements in metallic lathing used as a foundation for plastering and for other purposes."

Specifications Published.

26384. Hancock & Winzer, for "Kilns or muffles used for pottery and brick purposes."

27817. Roberts, Ball & Bangham, for "Apparatus for the manufacture of ceramic and other tiles."

30387. Kenyon, for "Apparatus for mixing concrete and the like."

16335. Staley, for "Kilns for burning earthenware, fire-clay goods and the like."

18210. Grainger, for "Bricks or blocks for building."

The Architect.

THE WEEK.

When an art gallery in Birmingham was erected as part of the Municipal Buildings, it was not anticipated that in a short period so many pictures would be obtained as to need a much more extensive wall-space. The site is central, but on that account cannot be readily extended. As teaching of art is now controlled in the city by the Corporation, there is a desire that no obstacle to progress should arise in the form of too limited an art collection. Inorder to hasten the erection of a new gallery Mr. J. T. Middlemore has adopted an ingenious expedient. He has offered to present to the Corporation several valuable modern pictures, viz. *Aspiration*, by G. F. Watts, R.A.; *The Triumph of the Innocents*, by Holman Hunt; and the following works by the late Sir E. Burne-Jones :—*The Merciful Knight*, *The Garden of the Hesperides*, the Pygmalion series (four pictures), and certain works purchased at the recent sale of the artist's works. Butt he offer can be withdrawn should there be undue delay in the providing of a new gallery. Lady Burne-Jones is also willing to present Mr. Watts's portrait of her husband, which is considered by the painter to be the most successful of his portraits. A sub-committee will consider the proposal, and it is to be hoped the difficulties will be surmounted, and Mr. Middlemore's noble gift will become available.

Builders will rejoice at the decision of the Middlesex magistrates on Saturday. Mr. Tennant, of Willesden, was recently summoned by an officer of the Inland Revenue for keeping a "carriage" without being provided with a license. The "carriage" was a light cart, which the builder used when visiting the works he had undertaken to carry out, and it was not used except for trade purposes. The magistrates at Harlesden dismissed the case. The officers of the Inland Revenue appealed, their contention being that in order to be exempted a cart must be employed solely for the conveyance of goods. The Middlesex magistrates dismissed the appeal, and when asked to state a case for action in the High Court, the chairman declined until they had further considered the subject. There was no precedent to guide them.

On Wednesday Sir J. Wolfe Barry, C.E., delivered the address at the opening of the 145th session of the Society of Arts. He selected for his subject the "Internal Traffic of London." It was pointed out that in the arrangements for streets there was no grasp of the greatness of the subject, for in the history of the past forty years we looked in vain for any new arterial thoroughfares traversing inner London from end to end and proportioned in width to the demands upon them at different parts of their route. On the contrary, we found in the new streets, as in the old, that the nearer they were to the heaviest of the traffic the narrower they were in absolute dimensions. Cheapside, Fleet Street, Piccadilly, the Strand, Marylebone and Euston Roads remained very much as they were fifty years ago, when the traffic was a mere fraction of what it is now. Sir J. Wolfe Barry said he desired to speak with all respect of those who executed the idea of Regent Street, for Nash's wide Waterloo Place and Regent Street, with its circuses at Piccadilly and Oxford Street, was a work conceived in a large-minded way. But most at least of modern street improvements seem piecemeal and patchwork enterprises narrowed to the smallest dimensions that would pass muster, and without any but the most meagre provision for the future, or, except in the case of Regent Street, the slightest attempt at systematic artistic treatment. In fact, there had been and was now a hitherto incurable *petitesse* in dealing with such matters in London which was in great contrast to what we saw in foreign cities of far less importance and wealth. To meet the traffic of London it was not so much additional railways, underground or overground, traversing the town and connected with the suburbs, that were wanted, as wide arterial improvements of the streets themselves. A scheme of new main thoroughfares of adequate width for present and future traffic should be laid down and realised as time and finance permitted. Apart from wide streets, a matter which had been too much lost sight of was the provision of means for allowing the north-and-south traffic to cross the east-and-west traffic with the least possible confusion. If some means could be devised for the crossing of north-and-south traffic over or under that going east and west at places like Hyde Park Corner, Piccadilly Circus, Ludgate Hill and Wellington Street, the relief to the main thoroughfares at those points would be enormous. The Euston Road (with Praed Street and Chapel Street at the west and the Pentonville and City Roads at the east), Oxford Street (including Uxbridge Road, Holborn and Cheapside), and the Strand (including Fleet Street, Ludgate Hill and Cannon Street), were almost ludicrously inadequate. Another want was a route for bicycle traffic. A new and spacious thoroughfare about 120 feet wide was also required. It might leave the Bayswater Road near Westbourne Terrace, follow the line of Wigmore Street to Russell Square behind the British Museum, and thence run to near Broad Street station. In addition, there should be two or three thoroughfares north and south, slightly less in width, which should be carried over the east and west route by bridges at the points of intersection, and all these new routes should have a raised or sunken road for bicycles, so that they should not mix either with vehicular or pedestrian traffic. Sir J. Wolfe Barry said the heavy expenditure should not affright us, for it would be repaid by the increased facilities both for trade and pleasure.

The special committee on building regulations of the Glasgow Town Council have arranged draft clauses which are to be embodied in the Bill that is to be promoted in the coming session of Parliament. They relate mainly to the height and cubic capacity of new buildings. The committee were guided in some measure by the provisions of the London Building Act of 1894. In the London Act of 1894 they found that 80 feet had been fixed as the maximum height to which buildings might be carried. The committee also concluded in favour of that limit, except in cases where the Corporation might give special permission. Looking to the great danger arising from fire in narrow streets, the committee propose that in streets of less width than 40 feet no building of the warehouse class should be erected of a greater height than the width of the street opposite the building. In streets of a width of from 40 to 60 feet the buildings might be erected to a height equal to the width of the street, and one-fifth more; in a street of more than 60 feet wide the height might be anything up to 80 feet. These proposals were not to be retrospective. The committee believe that one result of this regulation will be to encourage the laying out of wider streets. With a view to lessen the risk of the extension of fire, the committee propose a clause to the effect that no building of the warehouse class should extend to more than 250,000 cubic feet, unless divided by party walls in such a manner that no division should extend to more than that space. This clause was also derived from the precedent in the London Act of 1894. An amendment was proposed that the part of the committee's proposals with regard to the cubical restrictions be delayed. It was accordingly resolved to proceed in the meantime only with the clause in reference to the height of buildings. It was incidentally remarked that the plans were at present being prepared for a building 140 feet in height, and it was absolutely necessary that prompt measures should be taken to protect the city.

The long period which has elapsed since the restoration of the Arc de Triomphe was commenced does not give Parisians much belief in the excellence of the system for municipal works. When it was announced the Czar was to arrive the scaffolding around the structure was removed, but apparently the restoration is not complete, for, judging by the quantity of timber and stone which is at the place, the arch is not in a sound condition. It is declared that the principal cause of the delay is the want of money, and if votes can be obtained works will be expeditiously carried on. Strangers will be amazed if in 1900 they see a continuance of the present state of preparation, which has the inconvenience of suggesting the insecurity of Chalgrin's masterpiece.

PAINTINGS IN CHURCHES.

THE decision of the Chancellor of the diocese of Ripon on the subject of paintings in churches, which we reported last week, is not likely to be satisfactory to the majority of the readers of *The Architect*, although by a great many people it is sure to be approved as a check on practices which have given rise to controversy. It is the desire of architects to make buildings assume the most pleasing appearance. If the law did not intervene churches would be no exception. There is no more important class of buildings, but it is not to be expected that churches are to be exempted from the universal rule, and be able to charm the mind without any aid from subsidiary arts. An architect does his best to make his walls look well, but in this country there are days when the finest ashlar can have a cold and depressing appearance. At one time, when the private dwellings in England were not remarkable for good taste, it was no great sacrifice to pass on a winter's day from a cheerless breakfast-room to a cheerless church; both were supposed to be essential, like the bad weather, to the conditions of English life. But in our time, when the cheapest speculative villa is expected to exhibit modern taste in its wall-papering, door furniture, bay windows, coloured glass, tiles, turned balusters, as well as in the furniture, which is now obtainable on economical terms, we cannot expect that human nature will rejoice at the transition from a bright and it may be a luxurious home to a bleak church.

There are men of rigorous minds who can make light of such trivial sacrifices. But it cannot be denied that since the beginning of Christianity it was the aim of church rulers to make their churches attractive. The worshippers in the catacombs were not certain that they would ever return to their houses, and with so precarious an existence it might be supposed they would be indifferent to mural decoration. The fact was, however, that the lightest of all varieties of that work is exemplified in the subterranean chapel. It may be said the figures were intended to deceive official inspectors, or were symbolic for the initiated; it is still incontrovertible that a very joyous series of designs can be derived from the remains. The primitive Christians, we suppose, were strong in faith and could not suffer harm from the spectacle of amorini encircled with grapes when they were engaged in worship. But can we suppose if a church were decorated with reproductions of the figures and ornamentation derived from the catacombs, that a modern congregation would be in danger of falling into idolatry? Those who are so alarmed about the perils of painters' work do not do justice to the effects of modern science. We suppose there is not a child in a London Board school who would believe that a picture in which all the Royal Academicians co-operated was more than a piece of painted canvas, or that it was capable to work the simplest miracle. As long as that is the case there need be no fear of danger. Critics have, moreover, not the least hesitation about exposing the weakness of a scriptural painting, whether ancient or modern, and while they are on the watch superstition in one form at least has not much chance.

It will be said there was evidence in the Meadow Lane case that the obnoxious "Stations of the Cross," which were among the things in dispute, had induced superstitious movements, for "a lady, who was a stranger, on entering the church walked down the north aisle, stopped and bowed and made obeisance before each of the stations as she passed them." If a work of art is to become responsible for all the emotions it excites it would have a short life. We once saw a lady kiss repeatedly the relief of the boy in Panyer Alley and weep over him. Yet he only announced that he marked the highest ground in London. Why she should prize a semi-barbarous and mutilated specimen of sculpture who can tell? But would it be proper to remove the figure because it was inordinately prized? The amateur cavaliers of the White Rose League raise their hats when passing the statue of CHARLES I. at Charing Cross, their eyes sometimes overflow with tears, and in an ostentatious way they deposit posies on the pedestal. That is not constitutional conduct, and there was a time when their enthusiasm would be cooled at the public expense. But to prevent the increase of disaffection to the reigning house, would anyone propose the statue should be removed? Dr. JOHNSON considered JOHN CAMPBELL, the writer, to be a solid, orthodox man, although he was not in the habit of attending services in churches. His orthodoxy, according to the doctor, was manifest because "he never passes a church without pulling off his hat; this shows he has good principles." We are afraid Dr. TRISTRAM would not judge CAMPBELL so leniently. According to the Chancellor's reasoning, the churches before which the Grub Street writer uncovered ought to be removed in order to prevent "their being used some time or other superstitiously."

We have not seen the Meadow Lane "stations," and cannot express any opinion on their character. We are aware, however, that the majority of representations of the kind come from French or German "ecclesiastical establishments" which are not remarkable for good taste. The agents for the sale usually endeavour to get hold of the clergy, and persuade them to invest in the pictorial or sculp tured scenes without any consultation with the architects who have designed or restored the churches. As a consequence there are examples to be seen in English churches which, to say the least, are not satisfactory. Architects having a standard of fitness would be able to introduce "stations" and other representations which, while serving as aids to devotion, need not interfere with ecclesiastical law. We have only to go to Roman Catholic churches abroad where architects have power, to see the restraint which is exercised. In the new church which is to be erected on the site of the tragedy in the Rue Jean Goujon, Paris, where so many ladies were sacrificed through the burning of the bazaar, the "stations" are to be in oxidised silver, and in that material will be suggestive rather than realistically representative. In the fine church of the Trinity, where everything came under the control of M. BALLU, the "stations" are small enamel plaques in blue with white lights. There are other cases we could cite, but most remarkable of all are the "stations" recently introduced in the cathedral of Notre-Dame. Each consists simply of a number corresponding with the prayer book, with the addition of a couple of simple symbols which are repeated throughout the series. There is no representation of any kind, and yet we suppose the devotions can be as well practised as in churches with coloured reliefs on a large scale. The arrangement which answers in Notre-Dame surely should serve in England.

In arranging pictorial work what should be first considered is the object in view. Are the walls to be converted into a pictorial history corresponding with a common practice of days when books were not available for the laity, or are the figures to be typical or suggestive, like the mythological figures introduced in the catacombs? If the first-named purpose is decided on, it could hardly be expected that able painters can be obtained like those who were commissioned for the wall-paintings in the Panthéon. Occasionally it might be expected that an enthusiastic artist would contribute work gratuitously, like the late Mr. ARMITAGE, R.A., who painted scenes for a Roman Catholic church at Islington, or like the present President of the Royal Academy, who painted some scenes for a church at Dulwich. Those precedents are not likely to be often followed; besides, when several artists co-operate, as in the Panthéon, the result is not altogether satisfactory, for every painter endeavours to make his own work the most prominent, regardless of the general effect. From the size and character of that building the want of unity is not so remarkable, and now that the church has been secularised it is only a picture and sculpture gallery of a special class, and comes near the Bavarian Walhalla and Ruhmeshalle. But we hope that an English church will never become so varied. All the paintings should be subservient to the purpose of the building, and on that account pictures like the Scripture scenes which are occasionally hung in exhibitions of the Royal Academy would be out of place. What is required is a much simpler style of treatment which would be adapted to the circumstances of each building, and that character can be best determined by the architect. It is impossible to prevent human weakness from displaying itself, but there need be no difficulty in producing scenes which ordinary people would not accept as auxiliaries to superstition, and which the law of England would not be likely to prohibit.

The agitation which is now in operation, it is well to

remember, concerns works which did not come under an architect's control. They correspond to a great degree with the figures and objects introduced by THOMAS UWINS, R.A., in the picture which he called *The Interior of a Saint Manufactory at Naples*, and which obtained for him his associateship. In the Roman Church the use of such statues is generally restricted to the humbler class of churches in Europe and South America. The necessity for a less realistic treatment is becoming recognised, and in the new churches in the cities of Catholic countries the paintings and sculpture introduced are, with very few exceptions, frankly decorative. It is felt that the inspiration which belonged to the ages of faith cannot be now relied on as an everyday gift. Painters of Scripture scenes in modern times cannot expect to ascend far beyond the prosaic, and the least ambition which appears in their work, the more likely is it to be successful for the walls of a church. In other words, if architectural principles are supreme, there seems to be not much danger of enemies to orthodoxy appearing in churches, nor of works which, like those in the Leeds church, are no sooner painted than they have to be removed. Architecture and ecclesiastical law have a closer connection than is commonly supposed. At any rate, architects are not responsible for the difficulties which have arisen out of the decoration of churches, and which are causing so much trouble at the present time.

Cases often arise where a picture or a carved figure will not be considered as a mere decorative object. It becomes a trophy, a testimony of loyalty, a sign of faith. Æsthetic rules are then inapplicable, and to suggest that they should be used would be to incur a charge of heresy or irreverence. Those cases most often cause the collisions between clergy and chancellors. They all imply that the object, however inferior as a work of art, has importance and is beyond criticism. Architects as such are not in a position to deal with a work of painting or sculpture when it acquires qualities which the artist has not conferred on it. When TORREGIANO was condemned to death in Spain for breaking one of his own statues in a paroxysm of ill-temper, he could not comprehend the reason for his punishment. He considered he was unjustly treated. In the same way, it is hard to realise by anyone who has prepared designs and estimates, higgled over prices, and it may be, scolded the artists about carelessness, that the work which is the result of so commonplace a system of doing business can be in any way spiritual or unworldly in character. A lawyer takes a similar view. The question then is whether it would not be wiser to leave all arrangements relating to pictorial and sculptured work altogether in the architect's hands, when offences against English law would be as rare as those against good taste.

LONDON ARCHITECTS IN 1816.

ALTHOUGH useful, directories are not always adapted for light reading, but after a number of years they acquire a strange interest as records of men who have lived and have passed away. Chance has cast one of London for the year 1816 before us, and, as may be supposed, we turned to the names which represented architecture at that time. It is needless to say the majority do not recall works which add to the dignity of the Metropolis. The bearers of the names were no doubt excellent patriots who rejoiced that the long contest with France had ended; they may have deservedly acquired fortunes by their usefulness to their clients, and houses and other buildings by them may still exist in a sound condition. But respectability does not always confer immortality. The architects of 1816, like their successors, probably considered that more justice would be rendered to their merits by posterity than was granted by their contemporaries, but it does not require so long a period as eighty-two years to dispel illusions about fame.

We find four Royal Academicians in our list, viz. GEORGE DANCE, JOHN SOANE, JOHN YENN and ROBERT SMIRKE, jun., with one associate, JOSEPH GANDY. DANCE then lived at 29 Upper Gower Street. He was the second of the name, for it was his father, as surveyor and architect to the Corporation, who was the architect of the Mansion House. The Academician was born in 1740, and when his father died in 1768 he purchased the succession to the City surveyorship. He was only twenty-one when he took part in the competition for Blackfriars Bridge, in which ROBERT MYLNE was successful. Two years after his appointment he commenced rebuilding Newgate, the work on which his reputation rests. Among his municipal works were Giltspur Street Prison, St. Luke's Hospital and the front of the Guildhall. DANCE succeeded CHAMBERS as Professor of Architecture in 1798, but teaching was irksome to him, and he resigned in 1805. In 1815 he retired from the City surveyorship, and in the year to which we are referring he could hardly be considered as one of the practising architects of London. He lived until 1825, having survived all the original members of the Academy. FERGUSSON, while admitting the simplicity and honesty of Newgate as an example of architecture, undervalues the designer's share in its success. According to him, "From what we know of DANCE's character, we are led to suspect that it may have been *mere ignorance* that led him to do right on this occasion." With as much reason it might be said that the "History of Architecture" was a product of ignorance.

JOHN YENN, in 1816, was able to give Kensington Palace as his address. We suppose he held some official appointment. He was a pupil of CHAMBERS, and in 1771 gained the gold medal of the Academy by his design for "A Nobleman's Villa." Three years afterwards he was elected an Associate. He was principally engaged in domestic work, and lived until 1821.

JOHN SOANE was the Academy Professor of Architecture in 1816, and was then living in Lincoln's Inn Fields. At the time he was most fortunate. Originally a messenger, he had worked his way up to become chief adviser to the Government on all questions connected with building, and he could accept commissions as if he were conferring favours. Afterwards he was to suffer keenly, for the palace on Constitution Hill, which he wished to make a masterpiece, was never carried out, and he found enemies in his own household, but in 1816 there appeared a cloudless future awaiting him.

ROBERT SMIRKE, who is better known as Sir ROBERT SMIRKE, was in 1816 described as ROBERT SMIRKE, jun., for his father, the painter, was still living. The architect was one of the tenants of the Albany. He was a pupil of SOANE for one year. He travelled over a wide region, and when he came back to London in 1805 he at once found commissions. His principal works before 1816 were the Covent Garden Theatre, which was the scene of the O.P. riots, and Lowther Castle. Subsequently his public buildings were numerous. He lived until 1867.

JOSEPH GANDY, A.R.A., who lived at 58 Greek Street, Soho, was a clever man who wanted the power of self-guidance. SOANE was much indebted to him. Born in 1771, he won the gold medal of the Academy in 1790, and four years afterwards he carried off another in Rome. With all his ability he was not entrusted with commissions for building, and he depended for his income mainly on drawings for the publishers. Two of his brothers were also architects in 1816. MICHAEL GANDY, who lived at 1 Dorset Place, St. Pancras, was taught by JOSEPH, and was engaged by JAMES WYATT. He next served in the Indian Navy, and on his return to England was appointed civil architect to the Admiralty. Afterwards he joined Sir JEFFREY WYATVILLE, with whom he remained for nearly thirty years. MICHAEL GANDY lived until 1862. JOHN PETER GANDY, who was sixteen years younger than his brother JOSEPH, and one of the residents in Newman Street in 1816, could be called a lucky fellow. He entered the Academy schools in 1805, and afterwards exhibited designs of which the character is suggested by the titles, *Leading to the Apartments of the Dead*, *An Ancient City*, the *Environs of an Ancient City*. He was selected by the Dilettanti Society to visit Greece. There he met Lord ELGIN, for whom afterwards he built a house in Scotland. GANDY remained two years in Greece. On his return in 1814 he exhibited the *Mystic Temple of Ceres at Eleusis*. In co-operation with WILKINS he designed a tower 280 feet high as a memorial of Waterloo, which was never carried out. He became an Associate of the Academy in 1827. In the same year he changed his name to DEERING, in order to gain a large estate in Buckinghamshire. The

passing of the Reform Bill opened a way for him to Parliament as member for Aylesbury. In course of time he served as sheriff, and in all things was the prosperous country gentleman. DEERING died in 1850. Among his London works are Exeter Hall, a part of University College, St. Mark's, North Audley Street. As a Classic architect he would have gained a higher position if his energies were not directed to country pursuits.

WILLIAM WILKINS in those days lived at 36 Weymouth Street, Portland Place, and was in his thirty-eighth year. He was a Wrangler and travelling student of Cambridge, and was engaged on some of the University buildings. He had also designed the Nelson Column, which, in spite of much opposition, still stands in the midst of Sackville Street, Dublin, and in 1817 he was to erect another at Yarmouth. He was not to become an Associate of the Academy until 1825, but in the year following he was to be advanced to membership. WILKINS was in 1816 almost as well known as a writer by his "Magna Græcia," "Civil Architecture of Vitruvius," and "Atheniensia."

It was the time when Classic art was supposed to be the only one worthy of the attention of whoever wished to be considered an architect. CHARLES BARRY, who was to have a part in the Gothic Revival, had started in 1816 for Italy. His future associate, A. W. PUGIN, was a child of four. JAMES SAVAGE, who was a pioneer, did not display his power until 1819, when his St. Luke's Church, Chelsea, appeared as a revelation of the Mediæval spirit. He was known as a bridge builder in 1816, and his office was at 34 Walbrook. JOHN CARTER, whose knowledge of Gothic buildings was most extensive and accurate, could not be considered as a practising architect. His time was devoted to the representation of remains. CARTER lived at 12 Upper Eaton Street, but he was to pass away from an earthly habitation in 1817.

CHARLES ROBERT COCKERELL, the future professor, was in 1816 one of the English students who were then in Italy or Greece. His father, SAMUEL PEPYS COCKERELL, who was surveyor to the India House, lived at 8 Old Burlington Street. PHILIP HARDWICK was another embryo Academician who was studying abroad, but he had already exhibited at the Academy, and is entered among the architects as having the same residence as his father, THOMAS HARDWICK, the architect of Marylebone Church and of St. Paul's, Covent Garden (after INIGO JONES'S design), which was 55 Berners Street. WILLIAM INWOOD'S house was No. 3 Southampton Place, Euston Square. His son HENRY WILLIAM was a pupil with him, and it was not until some years afterwards that the adaptation of the Erechtheum for St. Pancras Church was to gain them reputation.

There were no less than four WYATTS among the architects of 1816, viz. BENJAMIN, GEORGE, JEFFREY and LOUIS. BENJAMIN, who lived at Foley Place, was the son of JAMES WYATT, R.A., and, strange to say, acted as private secretary to Sir ARTHUR WELLESLEY, afterwards Duke of Wellington, when chief secretary in Ireland, and subsequently commander in India. He was the architect of Drury Lane Theatre. JEFFREY WYATT in 1824 changed his name to WYATVILLE, in order that he might not be confounded with the numerous WYATTS that followed the arts. But in 1816 he was not of much importance as an architect. He had exhibited an imaginary view of Priam's Palace, but he had not commenced the great restoration of Windsor Castle until 1824. His residence was in Lower Brook Street, Grosvenor Square, where he died in 1840.

Two BEAZLEYS were then living—CHARLES, whose office was in Whitehall, and his pupil and nephew SAMUEL. The latter was subsequently the principal theatrical architect in England, and he also erected several railway stations. His chief work was the Lyceum Theatre, erected in 1807 and re-erected in 1830. Another architect who was afterwards to erect several railway stations was GEORGE SMITH, of Bread Street Hill. THOMAS CUNDY, sen., and THOMAS CUNDY, jun., whose names are associated with the Westminster property, were then living in Pimlico. In Henrietta Street, Brunswick Square, lived JAMES ELMES, who was surveyor to the Port of London, and wrote much about Sir CHRISTOPHER WREN and other artists. His son HARVEY LONSDALE, the architect of St. George's Hall, Liverpool, was three years of age when our directory appeared. GEORGE GWILT the second, who restored St. Mary Overy's Church, had an office in Union Street, Borough, while his brother the encyclopædist worked in, Stamford Street. Then, as now, there was a Mr. I'ANSON living in Laurence Pountney Lane. DAVID LAING, the architect of the Custom House, had his office at 48 Hatton Garden. He was not successful at the Custom House, and the building was altered by SMIRKE. LAING then retired from practice.

JOHN NASH was very busy in those days, for he enjoyed the patronage of the Prince Regent, but he was never able to become a member of the Academy; he lived at 29 Dover Street. GEORGE SAUNDERS was architect to the trustees of the British Museum and surveyor to the Commissioners of Sewers, and was to be found at 252 Oxford Street. JOHN SHAW, the architect of St. Dunstan's Church in Fleet Street and of the New Hall at Christ's Hospital, was another inhabitant of Gower Street. SAMUEL WARE, who was soon afterwards to erect the Burlington Arcade, was one of the residents in John Street, Adelphi.

It may be said that the greater number of the architects whose names we have recalled cannot be considered as worth the trouble which had to be taken. If so, what is to be thought of such men as ELSAM, DAVIS, CRESWELL, CROCKER, BUSBY, GIBSON, HUÉ, JUPP, LUGAR, MEDLAND, MALLIPHANT, ROLLS, ROPER, SEARLE, WICKINGS, SPILLER and many others? To us they are only names which awaken no more associations than those of their unknown clients.

ST. ALBANS CATHEDRAL: LADY AND ANTE-CHAPELS.*

THE subjoined report was presented to the Most Noble the Marchioness of Salisbury by the late Sir Gilbert Scott, R.A.:—

To the Most Noble the Marchioness of Salisbury.

Madam,—I have the honour of laying before your ladyship the following report upon that beautiful and venerable building, the restoration of which you have taken under your patronage.

When the abbey of St. Alban was re-erected by Abbot Paul, during the reign of the Conqueror and his son, the eastern arm of the church terminated in a semicircular apse where the "Saint's Chapel" now is; but beyond this no chapels or other buildings are known to have existed.

I am not aware that any great alteration was made in this part till the latter half of the thirteenth century; for, had such been the case, Matthew Paris, who was so minute in chronicling the changes in other parts of the church, would doubtless have told us of them.

He does, however, inform us that Abbot John de Hertford (in 1257), during the last years of his life, undertook some works at the east end of his church.

"It happened in the same year (1257) that, owing to some gaping cracks which caused alarm, the eastern part of the church of St. Alban (by the advice of the abbot and convent), after the roof had been removed in Advent, had its walls pulled down, in order that that part might be strongly rebuilt."

About 1259 or later Matthew Paris died, but he makes no further mention of this great work; and his successors, though industrious enough in chronicling all that concerned the worldly goods of the abbey, and its disputes—whether with the king or others—were singularly remiss in recording what was done as relates to the structure of their church; so that, though the entire eastern division of the cruciform structure was rebuilt or remodelled on a truly glorious design, and though it received the addition of a most exquisite group of chapels eastward of the original church, we possess, from the death of Abbot John of Hertford in 1260, to the accession of Abbot Eversden, some half century later, scarcely a hint of any such work having been in progress.

This work may, in general terms, be described as the substitution of a square-ended structure of the noblest Early Decorated style for the Norman apsidal presbytery and sanctuary, and the erection beyond it, in the same style, of the exquisite group of chapels now under consideration, which were internally united with the main structure by five arches, one in either aisle and three in the central space.

The structure thus added, though only of the height of the aisles of the church and so intimately connected with it, forms in its design a separate and complete building of itself, almost like a distinct church with its own nave, aisle, chancel and vestry.

The central space, however, which I have called a nave,

* See illustrations in *The Architect*, November 11 and 18.

was not intended to be, as now, of a single span, but to be divided by light and elegant columns into three widths, thus forming the western part of one group into five aisles, all of which were to be groined over somewhat like those of the lady chapel at Salisbury; each opening by its own arch into the church towards the west.

The three central aisles would have been of three bays in length, but the outer aisles of only two; while eastward, as a chancel, lay the magnificent lady chapel, of a width less than that of the three central aisles, though greater than one, the difference being formed by the eastern arches taking an oblique direction.

The actual date of this magnificent group, and of the eastern arm of the church of which it forms a continuation, has never, that I have been able to learn, been precisely ascertained, though it could not, of course, have been begun before the date already mentioned (1257).

Its style is decidedly later in character than that of the older parts of Westminster Abbey (1245-69), but, as it appears to me, earlier than that of the Eleanor Crosses (about 1291). I should therefore attribute it to the time of Abbot Norton (1260-91),* though it is not improbable that it may have been continued by his successor, Abbot Berkhamstede (1291-1302). Indeed the group was still incomplete on the accession of Abbot Eversden in 1308; for he not only found the lady chapel—properly so-called—only carried up as high as the string-course beneath the windows, but the central space of the west was probably still unroofed, and the contemplated ranges of pillars by which it was to have been divided into three widths had not been erected.

The style, however, in which Eversden completed the lady chapel forbids the idea that the work had been continuous; for it is of a wholly distinct phase of Middle Pointed architecture, and the same may be inferred from the historical notice in the "Gesta Abbatum" of the work of Eversden, where he is described as having "brought to a praiseworthy completion the chapel of the said Virgin in the eastern part of the church which had been begun many years before."

He is also described as having covered in the space between the lady chapel and the presbytery, or eastern arm of the church. "Moreover, that place contiguous in the shape of a square chapel, separating the presbytery from the said chapel, with a ceiling, in the middle of which the 'Assumption of the Blessed Virgin' is figured (wherein now the 'Shrine of St. Amphibalus' is placed), he at the same time took pains to finish."

It would appear, therefore, that the builder of the presbytery, or eastern arm of the church, began at the same time the entire group of eastern chapels under consideration, that he only carried up the lady chapel as high as the string-course, and that, though he erected the walls of the remainder to their full height, roofing in and groining their aisles, he failed to finish the central portion, but that, after a long interval, the whole was finished by Abbot Eversden between 1308 and 1326, in an altered style, and falling short of the original design in so far as he omitted the two central arcades of the western portion, and substituted a panelled ceiling for the intended groining.

The group of chapels thus completed offers as exquisite examples as it is possible to find of the two great phases of English Middle Pointed architecture.

The earlier portion is hardly equalled by any contemporary work in beauty of design; for, whether we look at the two arches which connect its aisles with those of the presbytery, its windows (more especially hose to the east of its aisles), its pillars (especially the eastern responds), or at its wall-arcading, it is among the most perfect works remaining; and, had its first ideal been carried out, it would have been yet more charming.

The eastern, or lady chapel, had similar details so far as the first architect went; and the second, while deviating from them, has added such exquisite beauties of his own that it is impossible to regret the change he effected. His work is groined like that of the earlier builder, with oak groining on springers of stone, but the number of ribs is increased. The vaulting shafts are intercepted by elaborate niches. The side windows, each of four lights, are beautiful examples of the Later Decorated style, the mullions and jambs being charmingly enriched with imagery. The eastern window of five lights is a singular combination of tracery with tabernacle work, while the easternmost bay on the south side, which is partly obscured by the vestry, has an exquisite window above, consisting of a richly traceried circle placed within a curvilinear triangle, beneath which is a splendid range of niches, and beneath them again a gorgeous range of sedilia and piscinæ.

The sides were arcaded similarly to the aisles of the presbytery and ante-chapel, but the whole of the arcading has been cut away. These arcades extended by one arch on either side of the east end, but the centre was left plain to receive the altar.

It is somewhat curious that the wall arcading on the south side of lady chapel and ante-chapel has rich cinquefoiled heads, while that on the north is throughout trefoiled, the distinction continuing even to the arches flanking the great altar.

The niches on either side of the arch by which the lady chapel is approached are precisely similar to two in the lady chapel itself, which seems to suggest that that arch and the wall on either side were left unfinished till Eversden's time, but this suggestion is discredited by the existence of groining springers on the earlier design which would not have been the case had Eversden built them. I conclude, therefore, that he only made alterations in this wall.

The groining of the south aisle of the ante-chapel contains charming specimens of the painting of the end of the thirteenth century, and I have little doubt that, as Eversden painted the panelled ceiling of the central ante-chapel, we shall find relics of his decorations in the lady chapel itself.

There has been a very curious passage leading into the lady chapel from the altar in the south aisle. This, I fancy, was an alteration by Eversden, or later. This altar was dedicated to St. Mary, and some ready communication may have been needed between it and the great altar of the lady chapel. This altar had a most beautiful triple piscina, now sadly ruined. The three were comprehended under one comprising arch, over which was a wide gable.

The original uses of this group of chapels must have been somewhat multifarious.

One may, in a broad sense, view it as a complete church, of which the lady chapel proper was the chancel, and the remainder the nave or ante-chapel, the arch opening from one into the other being the chancel arch, of which the original open screen of oak yet remains.

Viewing it, however, as a group of chapels, we have evidence from ancient authorities (recently collected and published by Mr. Ridgway Lloyd) as to the altars, &c., it contained. At the extreme east was the high altar of the Blessed Virgin, and in the vestry beside it the altar of the Transfiguration, which was founded by the Precentor T. Westwode in the fifteenth century, when the vestry seems to have been rebuilt.

At the east end of the north aisle of the ante-chapel was the altar of SS. Michael and Katherine, that at the east end of the south aisle was known as the altar of St. Mary of the Four Tapers; against the pillar of the north aisle stood the altar of St. Edmund, king and martyr, and corresponding with it, to the south, that of St. Peter.

In the midst of the central outer chapel stood the shrine of St. Amphibalus (renewed by Ralf Witechurch, sacrist, late in the fourteenth century), of which extensive remains have recently been found; and in front of it, to the west, stood the altar of that saint. Whether there were altars beneath niches on either side of the great arch leading to the lady chapel, we have, I believe, no record; but there is near one what may be the remains of a piscina, and near the other of an aumbry. The former, however, shows signs of having been grated with iron.

The great panels of the ceiling over this central space fifteen in number, were painted by Abbot Eversden, apparently with subjects of which the central one was the Assumption; they were afterwards repainted by Abbot Whethampstede with his favourite badges, the eagle and the lamb.

The question suggests itself whether there was an external entrance to this magnificent series of chapels, or whether it was solely approached by the aisles of the presbytery. In a document quoted by Mr. Lloyd, a doorway is mentioned as at the step of the altar of St. Mary of the Four Tapers, and leading into the cemetery. Now the cemetery lay to the south of the chapel, and Mr. Lloyd suggests that this door was the little doorway close by the altar of the Four Tapers. I at first thought this hardly possible, as that doorway led by a circuitous passage into the lady chapel. There would then be no place left for it but the portion of the opening at the south-west corner, now entering the footway so barbarously cut through the building.

There is a doorway, evidently of modern insertion, in the north aisle of the presbytery, which is formed of portions of several old works, but mainly of an ancient doorway of the date of these chapels. That it is not at home where it exists is rendered clear by many proofs, and I venture to entertain an idea that its leading features might belong to the ancient door into the cemetery above alluded to. This conjecture, however, is rendered doubtful by the somewhat curious fact that the wall-arcading of the bay in question has been capped by a very rich cresting of later date and of very unusual pattern, and that amongst the vast store of fragments dug up at different periods and stowed away in the church, there is an enormous canopy crowned with a cresting of this identical pattern. The *prima facie* conclusion from this would be that a vast niche or stall

* This conjecture is rendered the more probable by the circumstance that this abbot was buried before the high altar, and his heart before that of St. Mary of the Four Tapers, probably one of the only two then consecrated in the new chapels.

(perhaps a stall for the abbot) had in latter times been inserted in the wall-arcading of this bay. This renders Mr. Lloyd's idea as to the doorway probable.

I have before alluded to the recorded burial of the heart of the Abbot Norton near this spot. Its receptacle has been discovered while I have been writing my report. It consists of a cylindrical hole sunk in a block (or two blocks) of stone, in which was found the lid of a small wooden box of about 5 inches diameter. Such boxes have been found elsewhere, where hearts have been separately interred. This one, however, is very curious and deserves careful investigation, as its rich painting remains and is clearly of oriental character; a fact which (if proved) seems to connect itself with the friendly diplomatic relations which at that time existed between this country and Tartary.

It is stated in the annals of John de Amundesham, one of the chroniclers of the Abbey, that "in this aisle of the church near the further step of the altar of St. Mary, called 'of the Four Tapers,' there was a figure of Abbot Roger under a small marble stone holding a heart beneath his hands;" and in another place the same writer in enumerating the interments in front of the high altar of the church, describes that of Roger de Norton as in "the middle," adding, "his heart had been buried before the altar of St. Mary of the Four Tapers."

It is this little sepulchre which we have now found; and, curiously enough, the discovery has been the means of correcting an error in the printed text; for it is there said that his body ("cujus *corpus*") had been there buried; but on reference to the original MS. it was found to be not his body but his heart ("cujus *cor*"), a correction suggested by Mr. Ridgway Lloyd as soon as this curious interment was brought to light

The passage runs thus:—"DOMINUS ROGERUS NORTON MEDIUS CUJUS COR CORAM ALTARI SANCTÆ MARIÆ QUATUOR CEREORUM * * * FUERAT TUMULATUM."

This, as I have before suggested, confirms the opinion arrived at on other grounds, that both the presbytery and the eastern chapel were the work of this abbot. His body was placed in the post of honour in the presbytery, while his heart, in token of his equal interest in the eastern chapels, was placed before the more honourable of the two altars which they as yet contained.

There were very numerous burials within these chapels, but I would only allude to those of Lord Edmund Beuforde Duke of Somerset, Lord Henry Percy Earl of Northumberland, and Lord Thomas Clifforde Lord of Clifforde, who were slain in the first battle of St. Albans, and whom Abbot Whethampstede "entombed in the lady chapel, in lineal order, according to the state, rank and honour of their dignity."

The external architecture of the chapels was quite proportioned in merit to that of their interior. The windows are, of course, common to the two; the buttresses, base mouldings and parapets are all of fine design. The latter are more simple in the older chapels, these being plain and supported by a fine block cornice, whilst those to the lady chapel had a range of pierced quatrefoils and had running foliage in the cornice.

The roofs are all of low pitch, which was doubtless for the sake of avoiding any interference with the view of the eastern termination of the main building. That this arrangement is original is proved by the horizontal parapets at the east ends, both of the aisles of the ante-chapel and of the lady chapel itself, each being of the original date of its own building.

When we come to consider the present condition of these charming chapels—once resplendent with architectural beauty and replenished with objects of the highest interest and richness of decoration; their ceilings glowing with colour and rendered instructive by the sacred subjects they illustrated, their windows filled with storied glass, their floors enriched with encaustic tile and marble, and made venerable by sepulchral brasses, while in the midst stood the beautiful shrine of the proto-martyr's friend, of rich stonework below and jewellery above; and around it, in the ante-chapel, at least five altars with their accompaniments; and further on, in the lady chapel, the high altar of St. Mary, with the smaller altar in the vestry, dedicated to the Saviour, and His Transfiguration—when, I say, we come to consider the present condition of this once lovely group, how melancholy is the contrast.

The ante-chapel is a mere ruin, excepting only that its roofs have been preserved and cared for. Its stonework externally is in almost the last stage of decay and rudely repaired with brick; while internally, in addition to this, it has suffered wherever within reach from deliberate mutilation. Nor is this all, for, as if to pour out the last vial of insult upon the humbled structure, a public footway has for centuries been opened through it. This was during days of carelessness, but it would seem that some of the inhabitants still "love to have it so;" and unmindful that the abbey is the sole glory of the town, they are not ashamed to proclaim the higher value they place on the right to prolong her desolation than on the honour it would do them to say that they "take pleasure in her stones and it pitieth them to see her in the dust."

Happily, however, such ill feeling is very limited and the last-named sentiment prevails.

The state of the lady chapel proper differs little from that of the ante-chapel; for, though it looks more neat within and without, this arises mainly from the groined ceiling within being plastered and whitened and the floor boarded, while on examination the beautiful wall-arcading is found to have been almost wholly hewn away and the niches mutilated.

Externally, some restorations were effected many years back, on the south side and to the east window, but the other parts are in a most decayed condition.

The work of restoration, as will readily be judged from what I have stated, is one of no small difficulty and outlay. Take, for example, the wall-arcading, which is, perhaps, the richest of the internal details. In the ante-chapel it exists on the south side, but in a most mutilated state; while on the north, by far the greater part has been destroyed and replaced by brickwork.

In the lady chapel the whole has been ruthlessly cut away excepting one arch on either side.

Of the windows of the south aisle of the ante-chapel, one has been destroyed and the two others are ruinously decayed. Nearly the same is the condition of the north aisle.

Eversden's ceiling over the central space retains its framework but has lost its panels. The oak groining of the south aisle remains, but that to the north (if it ever existed, which I cannot doubt) has been removed.

The screen to the lady chapel exists, with just sufficient evidences to render its restoration possible.

The old floors both of the lady chapel and ante-chapels have long ceased to exist.

The stone substructure of the shrine of St. Amphibalus has in part been found. It is not so complete as that of St. Alban, yet I hope that it will be found possible to set it up in its old position; in which case St. Albans will stand alone amongst English churches in possessing intelligible representatives of two ancient shrines.

The objects I have in view in all the required restorations are to retain every fragment remaining of ancient work, to obliterate not one scrap of ancient wrought surface (preserving even the names and monograms cut in subsequent times upon the surface, many of which are very interesting); to insert no new stone or other work which is not essential; and, in short, so far as is possible, to repair the ancient structure without in any degree infringing upon its antiquity.

The lost arcading must of necessity be supplied, the ceiling of the ante-chapel rendered complete, the plastering removed from the groining of the lady chapel and the old woodwork repaired. The groining of the north aisle must be reproduced from that of the opposite aisle. The whole must have appropriate flooring.

I take it for granted that some understanding will be come to as to diverting the footway—that crying disgrace to the town—and then of course the walls which it perforates will be restored and the five arches which once united the chapels with the church will be opened out.

I can hardly imagine a moment of greater joy and thankful gratulation than that in which the chapels—restored so far as may be to their pristine beauty—are once again united with the parent church; and when the glorious series of scenes, opening out one after another, as you proceed from the western entrance —the nave—the choir—the sanctuary—the "Saint's Chapel" with the beautiful Shrine of the Proto-Martyr, shall not as now stop at that point, but shall continue through the five arches so long walled up into the ante-chapel with the shrine of St. Amphibalus in its midst; and on again, through the open screen, into the exquisite lady chapel.

This glorious consummation, Madam, will be the result of the noble work over which you have undertaken to preside, and in which I respectfully wish your ladyship every possible success.

I have the honour to be, Madam,
Your Ladyship's most obedient servant,
GEO. GILBERT SCOTT.

P.S.—I have not ventured to speak of stained-glass or of coloured decorations, while we have still to rescue the building from ruin and desolation.

EGYPT EXPLORATION FUND.

A GENERAL meeting of the Egypt Exploration Fund was held on the 10th inst. Sir E. Maunde Thompson presided.

The Chairman in his opening address expressed satisfaction that their treasurer had during the past year had to deal with no less than 5,000*l.*, a result surpassing, probably, the most sanguine expectations of the founders of the fund. Besides the Exploration Fund itself, they had the Survey Fund and the Græco-Roman branch which was started only last year

The former a few years ago was considerably in arrears; now, owing chiefly to the hard work and judicious management of Mr. Griffith, it had entirely freed itself from debt. The Græco-Roman branch had also met with the greatest success, and the sum on account of this branch for which the treasurer was answerable already exceeded 1,100*l.* The Exploration Fund itself showed dealings to the extent of 3,379*l.*, largely the result of subscriptions in this country and in America. There was also a legacy of 1,000*l.* from the late Mr. Edward Cooper. The Egypt Exploration Fund was, beyond a doubt, the most successful literary society in existence which depended entirely upon voluntary contributions. A main cause of its popularity was the immense human interest of its work. When we open a tomb and find in it the objects of everyday life, the ornaments, the personal possessions which were in use thousands of years ago and are still in almost the same condition as when they left the hands of their owners—this it was that touched us with that human sympathy that makes the whole world kin. There was, too, the keen delight in finding the unexpected, which in recent years had so often come to light, and of which the discovery of the lost Greek classics — Aristotle, Herondas, Bacchylides — were examples. But it was not only in the recovery of the classical writers that hopes were placed. The last year had brought to light the single leaf—true it was only a single leaf, but of what immense interest—a single leaf of a manuscript of the sayings of our Lord, and again we had a single leaf of a copy of the Gospel of St. Matthew; both these fragments were as early as the third century. It was not then too much to hope that sooner or later we should have in our hands substantial fragments, if not entire copies, of books of the New Testament, dating back at least to the second century of our era. As to the work of the past year, it would be remembered that the site for Professor Flinders Petrie's work last winter was at Dendereh—a site which was particularly eligible, as it was a large cemetery almost untouched in modern times. Although the finds were not perhaps sensational, a solid contribution to the history of the early dynasties, beginning as far back as the third, was the result of the excavations, and the antiquities which were discovered had supplied sufficient selections to be sent to twelve museums in this country, to five in America, and to one in Australia. They still had the temple of Deir-el-Bahari on their hands. The work carried on there by the fund this last year had consisted for the most part in repairing the walls and replacing the sculptured stones whenever their positions could be ascertained. This work had been superintended by Mr. Howard Carter, for whose unceasing energy they must always be grateful; but it was to Mr. Somers Clarke that they were particularly indebted for the advice which he gave in the restoration of this most important Egyptian temple. The repairs of Deir-el-Bahari were now practically completed, and only the protection of a few objects remained to be done. It had been a great work to clear this vast temple; the work had been carried on at great expense to the fund, and it would, of course, be a relief when they could write off the repairing account and hand over the temple to the Egyptian Government. But the handing over of the temple was not all. The drawing of the sculptures, which Mr. Howard Carter and Mr. Sillem had during the year continued to prepare, must be carried to a conclusion for the completion of the great publication which the Society had undertaken to issue under the able editorship of M. Naville. Turning to the Græco-Roman branch, subscribers had already received the first volume of the Oxyrhynchus Papyri, ably edited by Mr. Grenfell and Mr. Hunt; and they would be glad to know that preparations for a second volume were making good progress. In this later volume the editors promised some third-century fragments of St. John's Gospel, curiously written in parallel columns with another work, as well as fragments of the first Epistle to the Corinthians and of an Apocryphal Gospel; fragments also of classical writers—Menander, Euripides, Plato, Thucydides, Demosthenes and Xenophon—also a roll containing a large portion of the fifth book of the Iliad, written, alas! on the back of an important official document concerning the rights of married women. The literary papyri which were constantly coming to light proved that many works now lost were still extant in Egypt in the early centuries of our era, and consequently it was always possible that some of them would be recovered in a more complete form. The programme for the ensuing season was rather extensive. They would have four expeditions on hand, viz. the continuation of the work at Deir-el-Bahari, a further exploration at Dendereh by Professor Petrie, another visit by Mr. Grenfell and Mr. Hunt to the Fayum, and, lastly, Mr. Davies, for the survey, would turn his steps towards Sakkarah and the old tombs at Sheikh Said and Deir-el-Gebrawi, in order to complete the material which was gathered in 1892-93.

Mr. J. S. Cotton, the hon. secretary, then read his report, in the course of which he said that their activity in publication was shown by the issue last year of Professor Petrie's work on Deshasheh and the first volume of the Oxyrhynchus Papyri, Part III. of M. Naville's "Deir-el-Bahari," and Mr. Griffith's collection of hieroglyphs for the Archæology Survey. They might also expect during the year the first part of Professor Petrie's work on "Dendereh," of which the illustrations at least were well advanced, and a second volume of Oxyrhynchus Papyri. They had good reason also to anticipate larger support from America. From the foundation of the fund, and especially since the tour of the late Miss Amelia B. Edwards in the United States, they had been fundamentally an Anglo-American society. In some years, indeed, America has provided at least one-half of the income. The Archæological Survey was under the special charge of Mr. F. Ll. Griffith, whose new volume, "A Collection of Hieroglyphs," would be found to throw light on the origin and history of Egyptian writing, mainly from the collections of hieroglyphic characters formed during the early operations of the survey. For the Græco-Roman branch the total received up to July 31 was no less than 1,327*l.* Since that date about 210*l.* has been paid in. The net profits of the "Logia," of which 25,800 copies had now been sold, amounted to about 293*l.* There were twelve life members, including one from America, whose total contributions of 300*l.* had been placed to a deposit account, and he hoped for a regular income of at least 650*l.* It would be unjust to omit stating that the actual business of the Society continued to be conducted, as it had been for the last six years, by the efficient secretary, Miss Paterson

Professor Petrie gave an account of his labours, and said that the past season's work had opened out a good deal about one of the dark places of Egyptian history. The time between the close of the sixth dynasty and the rise of the eleventh dynasty at Thebes had left very few traces. In the cemetery of Dendereh, however, they had disclosed a large series of tombs which seemed to bridge over this break in the history, and to show a continuity of the civilisation in spite of poverty and rudeness. They searched all parts of the great cemetery, which stretches back about half a mile behind the temple of Dendereh and about a mile along the edge of the desert. In no part were there any prehistoric remains, the oldest tombs being a small group of about the close of the third dynasty, from which came the fine early false door of Abu-suten. But the continuous series did not begin till the sixth and seventh dynasties. Following on these tombs of the seventh dynasty they found a great number of tombs of two or three different styles of rudeness. The most elaborate sculptures were in bad proportion and ignorantly engraved. Strange to say, there was scarcely anything of the long and prosperous twelfth dynasty in the cemetery, but there was apparently a continuous series of tombs extending over the dark age of the seventh, eighth, ninth and tenth dynasties. Nothing important of later times was found until the flourishing Ptolemaic age, in which the existing temple was built. Many dozens of tombs of this age were found, usually each containing about a dozen mummies. So large a cemetery naturally contained a great quantity of sculpture, though of very diverse quality. Beside the sculptures some fine bronze vessels were found of the eighteenth-twentieth dynasty, apparently stolen from the temple and hidden in two deposits in the cemetery. The catacombs for the sacred animals were apparently begun in the eighteenth dynasty, and continually added to until the Roman age. In these catacombs they found buried three deposits of glass-work, which had been thrown away from the temple furniture. A splendid group of glass mosaic-work was thus obtained, which probably belonged to a great collar of Hathor. Thus the past year gave some much-needed light on Egyptian history, and had provided a considerable quantity of sculpture, bronzes, amulets, glass-work and other small objects which were very welcome in the museums of England and America. This was, of course, after the Egyptian Government had taken a very full half of all that they found. In the coming season they would, of course, have to work strictly under Government restraint and give up half of what was found. Moreover, again some entirely new regulations were to be applied, and they were still quite in the dark as to what obligations might be imposed. Time after time new terms of various damaging kinds were suddenly imposed at the last moment, and they had to sacrifice most costly working time of the season in order to obtain less unjust terms. The more careful and scientific the exploration the harder were the conditions of work, mere destroyers having a free hand and being rarely, if ever, punished. It was needful to say this, as so many people vainly imagined that the British occupation had in some way improved the conditions of work. They were, on the contrary, worse off by each change that had been effected.

The Church of St. Mary and St. Chad, Longton, which has been erected at a cost of 5,000*l.*, and will form the church of a new ecclesiastical district to meet the growing requirements of the neighbourhood, was consecrated on the 9th inst.

NOTES AND COMMENTS.

On the French coast, about ten miles south of Boulogne, is the village of Berck. It has of late obtained attention from French surgeons and others, for in it a Dr. Callot has set up a sanatorium for the cure of spinal diseases. Among the patients who went there as a last resource was a son of M. Besnard, the French painter, and Madame Besnard, the sculptor. The boy was cured, but Dr. Callot would not accept any fees. M. Besnard, therefore, resolved to discharge his debt by another and more enduring medium than money. He has painted the chapel of the establishment in a style which will draw many visitors to Berck. M. Besnard has already gained reputation as a mural decorator, but his latest undertaking has a completeness which was not attainable in a Paris mairie. His aim has been to depict Christ the Consoler, not as was done by Ary Scheffer in a single picture, but by a series. On one side of the nave a few of the dolorous incidents of life are depicted, at which Christ assists, while on the opposite side the Healer appears to have triumphed. Beneath are introduced the scenes of the Way of the Cross, and above are several angels with outstretched wings, and who bear scrolls on which words of comfort are inscribed. Behind the altar is another figure of Christ accompanied by a crowd of children, many of whom are weaklings. The whole scheme of decoration is adapted to the condition of the little worshippers, and it is treated with a tenderness and simplicity that recall the paintings of a more primitive age. Madame Besnard is supplementing her husband's gift by examples of sculpture.

Through the generosity of Madame Charles Garnier the library of the Ecole des Beaux-Arts will possess an interesting memorial of the architect. Like all Frenchmen of any importance he was bemedalled from time to time, and at his death possessed six of gold and about forty silver or bronze medals. They are now the property of the school. The most prized by the recipient was, although the smallest in size, that received when he obtained the Prix de Rome. Next to it in his esteem was the medal for which the workmen engaged on the erection of the Opera House had subscribed, and which was evidence of the admiration Charles Garnier had excited in minds that were not disposed to value architects very highly. The medal of the Institute of British Architects is among the collection. It was sacrifice on the part of Charles Garnier to have preserved so many valuable objects, but probably he wished them to form an heirloom. In that wish he was disappointed. The medals will not be the only memorial of him in Paris. It is proposed to have an architectural memorial designed by M. Pascal adjoining the rotunda of the library of the Opera House, which will be surmounted by the bust of Charles Garnier which was modelled by Carpeaux.

The history of the revolutions of the statue of Balzac might well form a volume in a new series of La Comédie Humaine. Our readers may remember that, after preparing several models of the figure of the novelist, M. Rodin failed to satisfy his patrons or himself. He then resolved to leave the statue for seven years without looking at it; at the end of that time he would decide whether it was worth perpetuating. The committee having charge of the undertaking gave a commission to M. Falguière. Being an admirer of M. Rodin he was placed in a difficult position, for the competition could not be on equal terms, and was without the ardour which often removes the bitterness of defeat. M. Falguière has therefore asked permission to rearrange, as it were, M. Rodin's elements. He takes the capacious dressing-gown, the big head, the mighty neck which formed the characteristic parts of M. Rodin's model. But instead of Balzac appearing to be walking in a hurry, he is seated on a bench, and on the left leg is a manuscript on which he is about to write. There is novelty in the model, and it has a suggestion of realism which should belong to any work professing to be a portrait of the great writer.

M. Frantz Jourdain, the Paris architect, who is a very wise and witty gentleman, has accepted the presidency of class 71 of the Universal Exhibition of 1900. It is a post which can be made to render valuable services to the whole world, for class 71 comprises the art of the streets in the widest sense of the term. We cannot say in England that we know all that can be done for making streets attractive, and the exhibits are therefore likely to have many of our local authorities for students. M. Frantz Jourdain is ambitious to suggest what is possible, and he has already obtained the co-operation of several architects, painters, sculptors and other artists. Leaving monumental works to the care of other sections, he will be content if he can gather examples of kiosques, seats, lamp-posts, music-stands and the like. Paris, which presents so much which is interesting at most times, ceases to respect beauty when a fair is to be held on the boulevards, or when shows are set up in the parks. Class 71 will, we hope, demonstrate how easily improvements can be accomplished. But as the objects would lose much of their value if left to themselves, it is proposed to have little fêtes, from which it can be judged whether the exhibits are convenient as well a beautiful.

A report which is to be brought before the Birmingham City Council next week reveals one of those necessities to which all towns that have advanced are liable. When houses began to be built in the Edgbaston and Harborne district, as in the other suburbs, it was necessary to be almost penurious in providing for drainage. Accordingly there are miles of small brick sewers 1 foot 9 inches by 1 foot 3 inches internal diameter, constructed half-brick in thickness, which would in more recent times consist of 12 and 15-inch stoneware pipes. Such sewers, when the joints give way or bricks perish, cannot be repaired, and a new sewer must be substituted. The manner in which connections for house drainage have been made in former years could scarcely be worse; in the brick sewers a hole has been broken through and a pipe pushed in, nothing more being done, the hole thus made being left to take care of itself. Generally the gradients are fair, although for the sake of economy the gradient has been sometimes sacrificed, with the result that what might have been a self-cleansing sewer has thus been made a sewer of deposit. It will be necessary, therefore, to construct new sewers over a large area of suburban Birmingham, and it is considered preferable to have a separate surface-water system. The cost of the work is estimated at 155,000*l*.

The president of the American Institute of Architects, Mr. G. B. Post, was able to congratulate the members who were present at the Convention in Washington on three events which he said would form an era in the history of American architecture. The first was the appointment of a supervising architect for Government buildings after a competitive examination conducted by a board of architects. The second was that architects in private practice were allowed to compete for Government buildings, and that the merits of their designs were assessed by a jury of experts In the third place, the Institute for the first time in its history had gained possession of permanent headquarters. Mr. Commissioner Wight announced that in the district of Columbia the maximum height of buildings was to be restricted to 90 feet unless in business avenues of a width of 160 feet. He also said it was the official belief that in competitions for public buildings and other works, those alone should be allowed to take part who had already shown their ability as designers. The following elections took place:—Mr. Henry Van Brunt, president; Messrs. Jenney and McLaughlin, vice-presidents; and Mr. Glenn Brown, secretary.

II.

Some Cathedrals and Churches of Normandy.

AFTER a cup of coffee in the pleasant "place" in front of the *votive* church of La Délivrance, we pressed on to Caen, arriving there after a thoroughly enjoyable, because so diversified, walk about five o'clock, but without coming across anything very noteworthy in an ecclesiological point of view. Proceeding first to the modern church of Notre-Dame de la Gloiriette—an Italian structure on the "motif" of St. Roch at Paris, but containing nothing very remarkable beyond the finely-carved organ-case and baldacchino over the high altar—we quitted it for St. Michael de Vaucelles, to which a pleasant walk across some fields and along the banks of the Orne led us. This is a very interesting church, consisting of a low, cavernous nave without clerestory or triforium, a Norman tower on the south, and a very lofty square-ended chancel. From the flight of steps leading to the Italian façade a fine panoramic view of Caen is obtained. This church is chiefly Late Decorated; in the same style is the fine large cruciform church of St. Jean in the street of that name, with its two unfinished towers, the western one having those reed-like shafts to the belfry stage noticed before as so common in the Caen district, the central one Renaissance. No good general view of St. Jean can be obtained, shut in as it is on three sides by houses; but of St. Pierre, a structure whose feature, par excellence, is its steeple, and which, from the large size and juxtaposition of its clerestory windows ought to claim the title of "The Lantern of Normandy," views can be had from any point. The erection of St. Pierre seems to have occupied almost the entire duration of the Pointed styles, for the church consists principally of First and Middle Pointed work, while its apse and fringe of chapels show the unsparing labours of an architect of the Renaissance. Curious and interesting though they be, these chapels ill accord with the rest of the building; and one looks in vain for a style like our Perpendicular to blend the two—the transition is too sudden. The elliptical arrangement of the apse clerestory, with its two windows in lieu of the three usually seen, may have furnished Street with the "motif" for his noble vaulted sanctuary at St. Saviour's, Eastbourne. Those who only know the interiors of the Renaissance chapels at St. Pierre from Roberts's and Prout's pictures, can form no idea of their present appearance, teeming as they do with niched figures and altarpieces, and glowing with a profusion of rich neo-Gothic glass. Space forbids us to dwell further on the many beauties of this noble fane, the only defect of whose interior is that it is too light. This may be accounted for by the immense size of the clerestory and the absence of stained-glass which may at some period have graced them. From St. Pierre we strolled up to the Abbaye aux Dames, or church of La Trinité—symbolised in the three figures holding

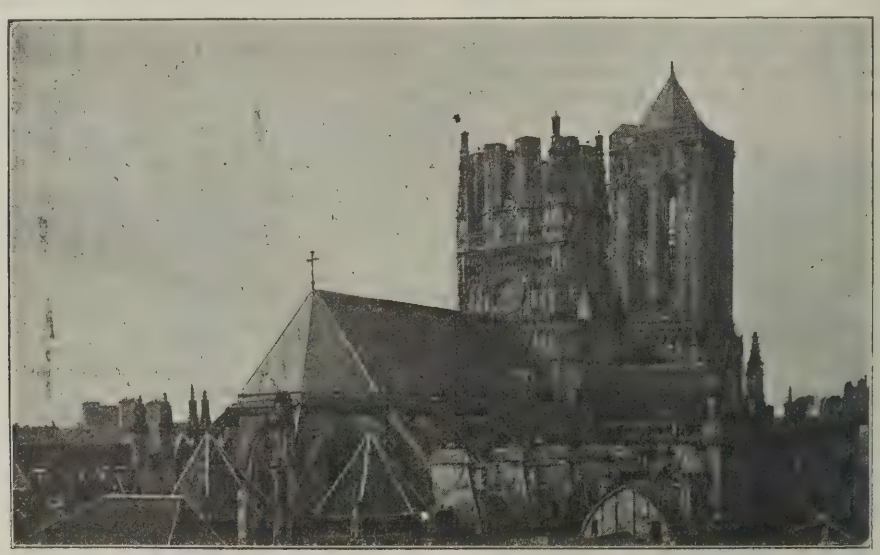
WEST FRONT OF ST. ETIENNE AT CAEN.



a scroll within the tympanum of the restored western portal. Here again the Renaissance architect has shown his contempt for earlier and purer forms by substituting work of his own at the tops of the western towers. That the original work was removed is clear from the fact that the whole of the south-east angle turret of the south tower still remains, and one can plainly see where the arcade was cut away. Although more ornate than the sister church of St. Etienne, the Abbaye aux Dames is richer Romanesque ; remarkably elaborated are the westernmost bays of the nave between the towers. The nave alone is used for parochial purposes, its last three bays being screened off for the "chorus-cantorum" and sanctuary, the parochial altar standing under the western arch of the lantern. Eastward of this the transept space is reserved for the malades and sœurs of the adjoining large hospital, for whose benefit an altar has been reared, backing against the parochial altar. Did the Abbaye aux Dames contain nothing else, the two exquisite First Pointed bays of the south transept would alone be worth coming to see ; they resemble the nave arcades at Wells, but are somewhat loftier. In walking hence to the Abbaye aux Hommes we noticed two desecrated churches—St. Gilles, opposite the Trinité, and St. Etienne le Vieux—both fine specimens of Middle Pointed which may, we sincerely trust, at no distant date be restored to their sacred uses.

The great pile of St. Etienne, or the Abbaye aux Hommes, whose simple, solemn Romanesque façade may be regarded as the prototype of those of nearly all the great French Pointed churches, has, viewed from the east, a rather strong Teutonic character, and, with its spires, central steeple and pinnacles flanking the apse, recalls in ensemble certain Rhenish churches. Throughout, the work is bolder and ruder than in the church of the Trinité, ornament in the nave at least being conspicuous by its absence ; but the choir in First Pointed is very graceful, and in the lancets of the clerestory there is some good modern glass. Very beautiful features are the small rose windows lighting the triforium passage in the choir, and peering through the unglazed opening in a very felicitous manner. Other noteworthy features are the clusters of vaulting shafts between the chapels in the choir aisles, which, with their First Pointed stained windows, brought Canterbury to our recollection very strongly ; the plain but massive Henri IV. stalls, and the grand open lantern above the tower arches. Early on the next morning, which was Sunday, we were strolling in the little churchyard of St. Ouen, a picturesque Late Gothic edifice which, with its "saddleback" tower filling up the angle between the south aisle and transept, is apt to be overlooked by the ordinary run of visitors, repairing subsequently to the Abbaye aux Hommes for the Morning Offices.

Those interested in the ritual and musical aspects of foreign ecclesiology will be gratified by attendance at the ten o'clock High Mass at St. Etienne's, presenting, as it does, several features not noticeable in cathedrals and churches where the Roman rite has completely superseded the ancient Gallican one. For previous to 1860 almost every diocese in France had some peculiar Use of its own, extremely interesting, no doubt, to the student of ritual matters, but which from a practical point of view was very perplexing. Thus in 1856 we find a "mandement" put forth by the bishop of the united sees of Beauvais, Noyon and Senlis, ordering the adoption of the Roman liturgy in place of the ordinary local uses, of which he says there were no less than nine in his diocese, so that it often happened that the same priest, "chargé de deux paroisses, trouve dans l'église où il va célébrer une première messe une liturgie différente de celle qui s'observe dans la paroisse où il réside; le chant, les cérémonies, les couleurs des vêtements, les usages, tout est changé."

Such reforms were, it is needless to say, received with no little hostility, many dioceses insisting on a large proprium sanctorum ; one privilege doubtless was the procession which as in all the cathedrals and churches of Normandy, made the circuit of St. Etienne's, before the office, and headed by the crossbearer vested in a cope; while another was the singing, between the Epistle and Gospel, of the Prose or Sequence in honour of St. Exuperius—upon the octave of the festival of that saint, who was Bishop of Bayeux, and therefore of local celebrity—to a very taking Gallican melody affording a pleasant relief to the severe plain chant.

In the early part of the afternoon we took the train for Bayeux, passing on the way the graceful steeples of Norrey, Bretteville and Audrieu, arriving in good time for an inspection of the cathedral before the commencement of the afternoon offices of None, Vespers, and Compline.

N.E. View of St. Jean, at Caen.

It is in its proportions, which are nearly assimilated to those of our own cathedrals, that the charm of Bayeux lies ; nothing is distorted or overstrained, and there is a repose about it which is eminently satisfactory, though we could not bring ourselves to admire the bulb-like dome of its Flamboyant central steeple. Perhaps no church in Normandy abounds in such exquisite detail as Bayeux ; indeed, it is a hard matter to decide what to admire most—the Norman nave arcade, with its wealth of diapering in the spandrels, its First Pointed clerestory and choir, or the magnificent Early Middle Pointed of its transepts. The choir seems almost to realise the very perfection of First Pointed beauty, so graceful are the combinations of clustering shafts and multitudinous lancets. The whole fabric is extremely magnificent, and built upon ground which slopes rapidly from west to east, cruciform in plan, with Romanesque and First Pointed western steeples and afore-mentioned bulb-like central dome surmounted by a flèche, and erected about thirty years ago to replace a cupola and spire of Italian design. The western steeples are noble from their simplicity, having their surfaces carved in imitation of tiles. Round the apse are grouped chapels ; the Decorated transepts project but two bays, and there is a fine south porch ranging with the chapels which

the same epoch has added to the nave aisles on either side. Taking our stand in the north transept we first noticed the magnificent window in each ; that in the south transept is

St. Etienne at Caen.

modern, the original tracery having at a debased period of the art been removed, as may be seen by one or two windows in this part of the building, but which it is to be hoped will ere long be restored. The character of these two great transept windows differs—the north, or original, window * is of seven lights with a large wheel in the head, and tracery of a more Geometrical character above each of the lights falling into the subarcuations. The south window has six lights, divided into triplets by a shaft bearing a niched figure; the large wheel above has a simple quatrefoil : both these windows have modern

Bayeux Cathedral from the S.E.

glass, with brilliantly tinctured effigies of saints well balanced by white glass. From either transept most beautiful views across the cathedral can be had ; indeed, the detail, especially of the choir, is so profuse that it is impossible at first to know what to direct the attention to first. Owing to the rapid slope of the ground there is a descent of several steps from the nave into the transepts, the crypt being confined to the centre of the church, and entered through a door in a richly arcaded wall in the first bay of the south choir aisle. The walls of the transepts below the windows are richly arcaded ; in the north transept I noticed a statue of St. Peter vested in a flowing chasuble, from the chisel of Dupont. The arches opening into the choir aisles from the transepts have foliated circlets in the spandrels, which impart great richness. The choir, entirely First Pointed, may be accepted as a typal work of that period, so graceful are the combinations of its slender shafts, multitudinous lancets and vaulting ribs. Fine grilles enclose the arches of the sanctuary ; the choir stalls, surmounted on the north by the "organ of accompaniment," are placed within the arcades, allowing the whole length of the pillars to be seen, as at Wells, and are of the most chaste Renaissance character. These and the stalls seen subsequently at Amiens were the only ones with canopies we came across during the whole of our tour. Unfortunately the coupled columns in the apse have been fluted by an Italianising hand. The spandrels of the choir groining are relieved by a series of heads of saints and bishops with their names in large letters, all carefully restored ; while from the centre boss of the lantern radiate painted angelic figures. In walking round the choir aisles we were much gratified at the total absence of those glass chandeliers and other ornaments from the toy shop with which the altars of French churches are too frequently disfigured, some having predellæ and reredos in good Mediæval taste. On the pavement of the lady chapel we noticed a memorial in mosaic-work to Carolius Didiot Virdune, who presided over the united sees of Bayeux and Lisieux, 1856-66. The first two bays on the south side of the south choir aisle are enclosed by a close screen of fine First Pointed work, and richly arcaded, surmounted by a beautiful double arcade separated by a slender

Choir of Bayeux Cathedral.

shaft, the lower stage being pierced with a door admitting to the sacristy. In the nave the work of three periods meets: the arcade is richest Norman ; the clerestory First Pointed ; and the aisle chapels Middle Pointed ; much of the tracery in the windows here is beautiful, some being curious. One window in the north aisle, a low one of six lights in pairs is traceried with a huge wheel of a very stiff and Geometrical character ; another window in this aisle is similarly traceried.

* Figured in Parker's Introduction as a typal window of the Early Middle Pointed French period.

Here is a good quantity of stained-glass, varying however in quality, but generally speaking very creditable, inserted as some of it was before 1850. A most picturesque feature in this cathedral is the flight of steps leading from the space formed at the west end between the towers down into the nave, and of which arrangement an admirable idea may be gained from the delicate outline engraving in Pugin's and Le Keux's "Architectural Antiquities of Normandy."

(*To be continued.*)

THE ARCHITECTURAL ASSOCIATION.

A MEETING of the Association was held on Friday evening last, Mr. G. H. Fellowes Prynne, president, in the chair.

The following were elected members :—Messrs. A. E. Bell, W. L. Binney, H. P. Buckingham, H. M. Cantley, H. F. Cundy, A. C. Stewart, S. M. Deacon, H. Dru Drury, H. L. Etherington-Smith, R. Findon, C. R. B. Godman, J. H. Mellish, E. N. Mitchell, J. A. Payne, H. T. A. Peacey, J. B. Royle, H. V. Shebbeare, C. O. Spencer-Smith, A. Symon, J. N. R. Vining, A. P. L. Wood, H. Worrow, F. F. Lemaistre, T. S. Vickery, H. E. Brown and W. J. Stainton.

Mr. H. Wilson read the following paper on

Arts and Crafts, and their Relation to Architecture.

There are certain phrases containing more or less microscopical portions of truth which only pass muster in those expansive thumb-in-armhole after-dinner moments when buttered aphorisms, like conventional oysters, slip from cloudy heights down the epigastric slopes into the clear champaign.

Among these abraded epigrams is this—Architecture is the mother of the arts—a dictum doubtless begotten by some wit with a bowing acquaintance with architecture and a refreshing innocence of art. It is one of those worn counters from an obsolete mint which keep real currency out of circulation, or, to change the lineage, it is a mental cul-de-sac, the result of what psychologists call "mental arrest." The aphorism renders real investigation difficult by acting as a stumbling-block. That said, we are tempted to think that there is nothing more to say. But immediately the stumbling-block is turned over we find that it hides the entrance to a new world of inquiry and opens out new views of art and craft and architecture. We begin to see that architecture is not the mother of the arts, for they existed thousands of years before she was born—we find that the arts and crafts are the ancestors of architecture, and that even now architecture is born from their conjunction and does not give birth to them. The question has been obscured by much discussion, and so many false ideas have been imported into it, that the right conception has been overlain by misconception and suffocated.

But if we go back to the beginning of things, penetrate as far as we can reach into prehistoric origins, we learn at once that the art of personal adornment and the craft of tool-making come first in the evidences of human activity. The art of using tools is acquired in the making of them—the stone-weighted stick becomes a hammer, the splintered hammer becomes the axe.

From splitting skulls to splitting wood the transition was easy and natural. Besides the more immediately insistent needs of protection, shelter and the satisfying of hunger, there arose in the very earliest times that other need of self expression. Full of wonder at the mysteries with which they were surrounded on every side—the dawn and the darkness, the gloom and hidden terrors of the forest, the strange creatures by whom the earth was inhabited, the dangers real and imaginary in field and flood—the minds of our half-dumb ancestors were crowded with conceptions seeking birth. This birth they found in what we call art. They eked out their stammering utterance, their gesture speech, with rude-cut symbols. They spoke to each other in their work, and one feels that art—rudimentary if you like, but still art—was the first real speech of mind to mind ; and, whether that speech took the form of decoration of weapon or bowl or person, it supplied an outlet for nervous pressure, and the labour of making relieved their minds from the obsessions of crowds of new ideas, new impressions, engendered by the beauties of the outside world. Not only did the making of things for use or ornament give an outlet for new ideas in the making of the humblest article of use, the savage by unconscious symbolism built up for himself a kind of religion. We find the Pueblo Indians, who worship water as the principle of life—to whom a vessel, because it holds water, is sacred—express their belief on their pottery in a very remarkable way. The enclosing lines, the circling bands of ornament on their bowls and vessels are never joined, but a space is carefully left open in such band. The women, who are the potters, say this is to leave a door for the life spirit. In other words, it is a departure trail for life or being.

When a woman has made and painted a vessel she will tell you with an air of relief that it is a "made being," and, as she places it in the kiln, places food in the vessel and beside it. The noise made by the pot when struck or simmering is the voice of the included being ; the clang of it when the vessel breaks or cracks is the cry of the spirit escaping.

This being never cries out unprovoked, but is supposed to acquire the power of doing so by imitation, and no one whistles, sings or makes any noise during the process of manufacture lest the being should imitate the noise, and by doing so crack the vessel and come out. Here we have art and craft as the early exponent and material source of early religions. In the South Seas we find that even the stone axe, from its associations with its maker, becomes first the symbol of the ancestor and later the object of worship. The handles of these sacred axes are carved by the "sacred men," who, during the whole process, chant songs and prayers to the gods that they may further the work and inspire the craftsman. Thus, as all the world over, the arts and crafts beget the first beginnings of expressed religion, and lay the humble foundation of the faith which made man "raise the soaring spires and sing his soul in stone." Out of arts and crafts all human achievement has sprung.

For we must remember that at this early period each man was an artist because he did not concern himself with art just as children do, and say and think beautiful things naturally ; only when we teach them do they become affected and artificial. And all that our ancestors thought of was the suitableness of the thing they were making to the use for which it was designed. The decoration of it was a natural instinct, as those of sleeping or eating. Impelled by that unconscious passion for creation, as by a spiritual procreativeness, the dimly comprehended beauties of the scene around him impinging on his perceptions stimulated his conception—pushed him out of himself into his work. His hut, with its contents, was a little exhibition of the arts and crafts in embryo. We are looking at the remains of the first beginnings of architecture In the lap of time. Our ancestors were the primary craftsmen, and this art expressed their nature, gave form to their spirit, as the plant expresses the principle of growth—the life within the seed.

Nor was this all. The offspring of this primitive artist would naturally imitate their parent. Besides the inherited aptitude, besides his precept, they would have the continual stimulus of his example to urge them on to other efforts on similar lines, and thus early arose families of craftsmen, with nascent traditions and methods of work. When the scattered families gathered into tribes and built their palisades they joined themselves into families of craftsmen and formed the rudiments of a guild, a society within a society, a centre of social activity inside the new society.

Each member of the family worked out in his own craft the budding ideas of early symbolism, doing nothing without a definite object, more influenced by the wonder of the world around him than impelled by a conscious ideal of beauty ; the character of his work was at first governed absolutely by the nature of the materials at hand, so that he found lines of beauty in the fracture planes of flint. Then by elaborating the rude notchings in the weapon haft he produced the intricate patterns on his paddle, or he evolved bands of ornament from the marks made by the cords or the wickerwork moulds which bound together his first rude efforts at pottery. He was taught by difficulty and inspired by nature. His mind grew as the plant grows, and his art was the fruit, the spore from which, under other conditions, a higher growth was to spring. When in the course of centuries the congress of the families of craftsmen gave birth to the guilds, their power came not merely from the infinite slowness of their growth, but also from the infinite ramifications of the roots which each individual fibre of that organism sent back through each item of its ancestry into the remote past.

The guild became the wide-spreading tree rooted in society, under whose branches every human being sheltered. It was as much the natural product of evolution as the family or the human being—like the human being also it found its completest development late in history. The hereditary craftsman existed, worked and trained his offspring long before city life attained any high development, but when that development took place and corporate life sprang from the associated lives, then the formative idea the soul of the society and its governing power centred itself in the guild.

And when I say that the guild only came into corporate organised existence late in history, it is only late in relation to the time taken in the evolution of society, for in Egypt in some of the earliest monuments we find that the brotherhood of masons had existed long enough even then to become mythical ; we find mention of the heavenly architect Ptah, who in conjunction with the chief of the brotherhood of masons, founded the temple of the heavens on the abyss of the waters. The master builder as prince, priest and creator is thus bound up with the origins of the religion, the shrines of which in later times his descendants were to build.

Coming down to more historic times, we find that in the development of crafts from family industries to trade guilds it early became a law that each man shall train his family in his own trade. In far-off Peru, in earliest Egypt and in India, this custom prevailed. It was the same all through Europe. In the Institutes of Theodosius a Roman youth was compelled to follow the employment of his father, and the suitor who sought the hand of the daughter could only obtain the bride by becoming wedded to the calling of her family. So in Mediæval France crafts were inherited and also in England. Thus the branching of the family through generations into a number of kindred families carrying on the same occupation produced the germ of the guild and formed a distinct cluster in towns. In process of time came apprenticeship into the family circle to learn the trade. By-and-by, with increase of trade, the master develops into the trader and the workman into the citizen. Thus the craft guild is the typical form of the institution. As Lambert says, when the townsmen of Stratford-on-Avon were required in the year 1381 to make a return to the King's Government as to the ordinances of their guild and the date of foundation, they made reply that as to its origin it was "whereunto the memory of man reacheth not." The saying was a wise one. There is no institution which has had a wider distribution or which reaches further back into the mists of ancient history, and there is, perhaps, no institution which has had a more important influence on human development.

Not only did the guilds mould and govern social life, they influenced religious life also, for there was then no distinction between the two. From almost the earliest times each guild was dedicated to some presiding genius, some to the Muses, or in Christian times to a special saint. In the Western world we have St. John, St. Michael, St. George, St. Crispin (cobblers), St. Peter (weavers), Our Lady of Pity, St. John the Baptist (tailors), St. Luke, St. Margaret, St. Barbara, St. Clare.

In the Eastern world we have Adam as the patron of the bricklayers, builders and sawyers, Nimrod of the smiths, Noah of the carpenters, and Enoch watches over the workers of metal and the makers of copper caskets.

The important meetings and feasts were held on the festivals of the patron saints; the needs of the Church were largely met by their funds—they gave windows, altars, reredoses, built chapels, chantries, whole churches even; and when we remember that the first meetings of the Christian Church in the first centuries were held as often in the guild halls, scholæ, or the collegia as in basilicas, and that in these guild halls with their apsidal ends, features absent from the pure basilica, we have the germ of the plan of the Mediæval cathedral, we see how the guild has shaped the house of religion. Even in Phœnician days we find that the factories set up in the ports scattered over the Eastern and Western world were used not merely as places of business and halls for the guilds; they were established in the first instance and were continually used as places of worship sacred to the cult of various deities, and a contribution was raised on all the mariners visiting the port for the sustentation of those places of worship; and in the later period of the Empire, Syrian merchants, chiefly Apamean, are found settled not merely in all Italy, but in all the larger emporea of the West—at Malaga in Spain, in Gaul and Germany, at Bordeaux, Lyons and Paris, at Orleans and Trèves. They are found in these Gallic towns after the Frankish conquest, and Salvianus and Gregory of Tours both speak of them, and show that they retained their national customs and organisations. Here, then, at length, we find the Roman cities of Gaul, and probably also of Britain, with their collegia and sodalicia, brought into close contact with the trade associations of the Syrians, representing the Greek and Phœnician tendencies of the commercial East. We must remember that the commerce in those days compares very favourably with the present day. In Central Asia, in Thibet and Mongolia the plains now known only to scattered colonies of shepherds, or the ignorant inhabitants of isolated villages, were once dotted with flourishing cities, the capitals of powerful kingdoms, bound together as by bands by great trade routes traversed continually by crowded caravans. Merchants from Macedonia found their way to further China, and threaded the passes of Afghanistan and Cashmere on their way to the Hindoo peninsula. Then from all these countries came traders, themselves masters of some craft, travelling with their wares over the Indus, over the Euphrates to Syria, up the Oxus to the Caspian, thence to the Black Sea and Europe. Now Central Asia is waste; the Oxus no longer flows into the Caspian; the streams of caravans have ceased, and life flows in other channels.

The Phœnicians, with their fellow civilisations, have faded utterly away. Through their descendants the Greek-speaking Syrians continued their work. But imagine the influence of these wandering guildsmen and their descendants exerted while they lived. Can we wonder that architecture is a romance book when it was written by men who came daily into contact with these living records of adventure—men with minds stored with strange legend, full of fascinating tales, who threaded the ways of Western Europe, resting awhile at each notable town, the guest of their own or the local guild, where we picture them seated with the master and the wardens at the high table, the swarthy, prick-bearded, keen-eyed Syrians, recounting adventures, pouring out travellers' tales to the open-mouthed craftsman, who from this living book got an inkling of Oriental learning, heard the latest legend, heard of the last new statue, carving or masterwork in metal, made by members of the Eastern guilds. He would see open before him bales of strange stuffs; the guildsman would display his bronze and silver ware, his belts and brooches, his earrings and bands of gold, and all, from the master to the apprentice, would drink in the influence of the East, as mystical, as wonderful to the Western then as now. Thus we get the guilds as the disseminators of culture, distributing centres of intellectual force as well as shapers of society. They were publishers of living, useful knowledge, loops in the network of organisation which art and trade, even in those early times, had thrown over the civilised world.

The influence thus gained by these organisations naturally fluctuated—wars, tumults, invasions, each brought disturbance and destruction with them. But guilds founded on an unchanging human principle grew steadily in power until in the Middle Ages in England and the Continent, as Dr. Lambert says, the whole municipal, industrial and social life moved in the circle of the guild. The guilds were the chambers of commerce, the friendly societies, the trades unions, the freemasonry, joint-stock companies, the militia and the police, and in a way were local parliaments. As early as the end of the twelfth century the rectors of the art guilds in Italy assisted the Podesta, or supreme magistrate, in governing and ordering the cities in which they lived. More than this, the guildsmen, by their shows, pageants and miracle plays, provided largely for the amusements of their times, and laid the foundation of dramatic art, which later was to give us Shakespeare, Molière, Goethe. They were at once the heart and brain of their people, and in studying their history we are carried back and plunged into that throbbing life which though it produced them they directed, and we see in what an extraordinarily simple way the whole thing was managed. Members of one great family, they sat beside each other in the feasts, played in the miracle play, rode in the pageant, fought side by side with the others, and in siege time together paced the ramparts; they helped each other in distress, saw that likely youths were made apprentices, and sang masses and burned candles before Our Lady for the peace of the souls departed. In studying their records and their works we are touching the living body of a living society: we walk with the young apprentice through the narrow streets to his master's shop; we learn the secrets of the counting house, the mysteries of the crafts, and we understand how it is that our fathers did these wonderful works which we emulate in vain, and how futile it is that isolated individuals should try to imitate or repeat what were the products of wide-based, close-linked society, instead of seeking the same harmonious and intimate relations with their surroundings which our fathers established, and working out ourselves naturally on the firm basis of individual craftsmanship. But the origins of this want of harmony with our surroundings are to be seen even in the works of the best period of the Renaissance, for after the ebb of that tide of effort which gave us the fine early work at Verona, Venice and elsewhere, we see traces of the intrusion of the designer into other spheres. We have the painter and the sculptor designing for the metal-worker, not executing the work for himself, but getting others to do it, and this invasion of the designer soon developed into the establishment of design as a separate faculty as we know it now.

To return for a moment to the consideration of the prehistoric crafts from another standpoint. These integers of design, detached, disunited, the scattered seeds of architecture, yet contain in themselves the essence and the promise of the highest art. The natural craft, the uncultured artsmanship was limited in range and achievement, because it was the product of isolated minds, but when men banded together the gestation of architecture advanced another stage. The work of each man was modified in aim and character by that of his fellow, just as the single circular cell of the primitive bee became hexagonal when clustered with other cells of other bees. The comb is the logical outcome of bee-society. In like manner each of us is modified by contact with other natures in the close-packed human crowd. As the body is built up of cells, each modified by the position and functions assigned to it, but each aiding by adding its individuality to the general system—in the production of the complex organism man—so man as an infinitesimal item comes with his instincts and faculties into the social system and is modified and developed by new conditions into a newer and higher being. His art has undergone precisely similar changes. The rudimentary arts of our ancestors, when brought into mutual contact, were changed in character and raised in aim though their fundamental nature

is the same. The personal arts were the individual components out of which the body of architecture was ultimately to be shaped. The self-centred, single expression art has become a social expression. The man, no longer concerned solely with himself, is informed by a new spirit. The scattered items are united by the social idea—the work of those items in every department of life is shaped and guided by the spirit of the race, and is the material expression of that hidden, life guiding soul which everywhere animates society.

Architecture is thus a complex art, a social art; it has never been and never can be a one-man art, as painting and the crafts, any more than a body can be composed of only one cell. And as that material envelope of the human spirit we call the body is the absolute expression of the human soul, so that material envelope we call architecture is the absolute expression of past states of the racial soul. This it is which gave the artists such strength in the past. His was not a detached existence, a separated, solitary-studio life; he had the whole body of the people behind him. He was the point with which the nation wrote its history. He was the tool of the race. And were we psychologists enough, were our powers of divination great enough, we might read in the open scroll of building not only the history of the actual craftsman, but the history of his time and people, and gain a graphic idea of the growth of mind. This because the craftsmen were the means of architecture, and the buildings were the opportunities of craftsmen.

(To be concluded.)

LEEDS AND YORKSHIRE ARCHITECTURAL SOCIETY.

ON Monday the annual meeting of the Leeds and Yorkshire Architectural Society was held, when Mr. George Corson, the president, delivered an address. He congratulated the secretary upon the excellent syllabus arranged for this session. It promised to be the most attractive they had had for many years. The council had arranged to have the use in future of a large room in the old Medical School, and the hour of meeting had been changed to half-past six instead of half-past seven. The council had had under consideration a form of agreement between builders and those for whom they built. This form had been submitted to the Builders' Association, and he hoped it would become a general basis of contract not only in this district but throughout the country. The Royal Institute of British Architects had recently issued a revised schedule of professional charges. It was necessary that it should be understood that 5 per cent. upon the total cost of the completed building was the architect's authorised charge. Sometimes a client chose to obtain various fittings, &c., from other sources without referring to the architect, who, however, was entitled to his commission upon such fittings. Again, a client might omit certain portions of a building after estimates had been obtained and conditionally accepted. The architect was entitled to a commission upon those—not the full percentage, but at least 3 per cent. It was not where there was one client concerned, but where there was a committee or a board to deal with, that difficulties arose. Conscience was singular, not plural. Where the cost of work was small, as in alterations, it was not recognised that 5 per cent. was unremunerative to the architect, and clients thought anything higher was an overcharge, although the labour involved might be as much as in work that was of greater cost. Leeds, continued the President, was a new city, but a very old town, and it had inherited a legacy, like most old towns, from former ages. That legacy consisted of narrow streets and crooked ways, totally inadequate to accommodate the immense traffic that had resulted from the increase of population and trade. Within the last fifty years the population had increased from 200,000 to over 400,000, and was still increasing at the rate of something like 7,000 a year. From the immense increase in the value of property in the centre of the town, it might be said to be practically impossible to widen such streets as Park Row and Commercial Street. There was, however, another way in which the traffic might be relieved. New streets could be pierced through dense masses of property of comparatively small value. After Boar Lane was reconstructed the Corporation seemed to fall asleep for many years, and for some time any attempts at street improvement were spasmodic. Lands Lane was an example of this. It had taken thirty years to reach its present stage of partial widening. Of late the giant had awakened from his slumbers, and would not, he thought, be allowed to resume them. Private citizens had seconded the efforts of the Corporation, and everywhere enterprise was manifest. Victoria Square still needed artistic treatment. There they had one of the finest buildings in England —the Town Hall—affronted by a group of wretched buildings, only fit to be carted away. It would be well if the space they occupied could be added to the square as far back as the south frontage and South Parade But he was afraid this idea was utopian. Law courts and an art gallery more befitting the dignity of Leeds than the present would have to be undertaken. The art gallery had served its purpose well, but would no doubt be absorbed either by the municipal offices or the free library. The action of the council with regard to such architectural work as they had to direct had been brought to his notice by several members of his profession. In former days all such work was confined to members of their profession. But of late years it had drifted into the hands of the city engineer. At the present time he was told that certain buildings were being contracted for, the plans for which had emanated from the city engineer's office—for a police station and a branch of the free library, at a cost of about 6,000*l.* He (Mr. Corson) would have thought the engineering work properly devolving upon the city engineer's office would have been enough or more than enough for the energies of that department, without encroaching upon the special field of architecture. The present Lord Mayor had architectural tastes and sympathies, and they might ask him to put an end to this anomaly.

Mr. J. Tweedale, in moving a vote of thanks to Mr. Corson for his address, thought the President took rather too rosy a view of the probability of clients, under certain circumstances, paying adequate remuneration to architects for extra labour done by them. There did not appear to be that appreciation for the architect's labours either by the individual or corporate client that there ought to be. With regard to the appearance of Leeds, they hoped they were at the dawn of brighter things. People had got at last to be ashamed of what was considered good enough by their fathers, and no doubt in the course of a few years there would be such a revolution in the appearance of Leeds that the citizens could go away and not be ashamed of saying where they came from.

Mr. Butler Wilson seconded the proposition, which was carried with acclamation, the President briefly responding.

A smoking concert followed.

THE PARTHENON MARBLES.

(Concluded from last week.)

IN her concluding lecture, Miss Harrison said she had in her previous lectures brought before her audience the ideals of the Greeks, and had pointed out how they expressed their ideals in art, and now it seemed right that she should not complete the subject without telling how these same ideals enabled them to face death. For that purpose she would take them to the Kerameikes, or the cemetery of Athens, where the grave reliefs—found as it happened by accident during excavations—afforded them the materials for seeing what the Greeks felt in relation to death, and completed the account she tried to give them of their joyous attitude towards life. It was also the necessary sequel as regards art. These grave reliefs were a good deal later than the Parthenon marbles, and some of them carried on the tradition of the work of Phidias very carefully and closely. They had in them the same stateliness, the same proud look in the face, the same beautiful austere drapery, the same great ideal manner. She could not help thinking that when the Parthenon was finished there must have been a numerous number of sculptors more or less inferior workmen who worked under the orders of Phidias thrown out of employment. Numbers of them had come from the various schools of sculpture in the islands, and when the Parthenon was finished probably they would be unwilling to return home. They had been for years in Athens; their children would be growing up about them, and it was not so easy then to change one's home. All these workmen, with the great tradition of Phidias before them—thrown out of work—would occupy themselves naturally with any smaller works of sculpture that might come to hand. That was how, she thought, they could in a way account for the grand manner of these sculptures, for they had the grand manner, although many of them were mechanical in style. These grave reliefs were famous because of their extraordinary simplicity and simple humanity. They represented for the most part scenes of daily life. In one they saw the lady of the house having her sandal loosened; the maid stoops to tie it and with the most natural gesture the lady poises herself with her hand on the maid's head; another maid waits close by with the toilet box in her hands. In another they had two scenes from the lives of men and boys. A young man was seen going out to serve with the army; his horse was near him, he held his spear in his hand and said farewell to his father. Simpler still—almost to them incredibly simple—was the figure of a boy conning his book. There really seemed nothing to explain in these works—no difficult mythology; the whole thing was so straightforward; but as they examined these reliefs more in detail they would be struck by certain characteristics which would be explicable by having recourse to the history of certain phases of religious feeling in Greece, and particularly in Athens. It had been noted in all these

grave reliefs with what extraordinary reserve they treated grief—how very dignified, how very steadfast the attitude of the figures was when they came to the moment which was apt to shake the strongest nerve, the moment when they parted from their friends. There was, the lecturer thought, a traditional element which helped to cause this reserve in the presence of the Greek, and this led up to the consideration of certain points in connection with the burial of the dead among the Greeks. They got their information about Greek funeral customs very largely from Greek vases. There was a certain class of vase used directly in the service of the dead; they were always oil vases, and were decorated with subjects taken from funeral scenes. In one specimen the dead man was seen lying on the bier; he was propped against pillows. On his head was a wreath, for a dead man was always crowned as soon as life departed. There was a mourner by his side lifting her hand to her head in a characteristic Greek gesture, and at his head was the lekuthos, or oil vase. In Aristophanes they would remember the man who complained that his wife used to go off in the early morning to the parliament of women, and he says she left him for all the world like a dead man, only she forgot to put lekuthos at his head. Down below the tomb was a goose, which seemed to be the tom-cat of the Greeks. The bier was always an open one, and to this day in Athens the dead, dressed in evening clothes, was put on an open bier and carried through the streets at a brisk pace. It seemed very terrible to them, but the Greeks appeared to regard it as a very reverent proceeding, and the women raised a lamentation. When the dead man was buried there was yet another stage through which he had to pass, namely, to the lower world, and certainly at some times in Greek religion and thought the lower world was regarded as a place across a sea. The ferryman of the dead sea was Charon, who was regarded as an ugly slave, and on one of these vases he was seen rowing his boat up to the shore, while Hermes, with his herald's staff in his hand, was conducting the soul, which seemed to shrink back a little, as if rather disinclined to enter the boat. There was an idea as early as Homer's time, that when a man of great valour died he was not laid at rest like others, but two winged messengers came to lead him quietly into the grave; these messengers were the bearded brother Death and the beardless brother Sleep, and that idea of the winged messengers had gone on and found its way into Christian art. It was an easy transition from that idea to that of the winged angels carrying a dead man to the upper air, and there grew up bit by bit this notion of the upper heaven to which went certain elect souls, endowed by the gods with beauty and strength, and related to the gods as sons or daughters, or married to the daughters of the gods. A notable instance was that of the young and beautiful Ganymede, who was translated to the upper air to serve King Zeus. This idea was most beautifully developed in the conception of the Elysium fields presided over by Rhadamanthus, to which Menelaus, the husband of Helen, was translated. The Greeks always managed to put things beautifully, and so they put this belief of theirs, that the soul, born of rich and well-connected parents, went to this upper heaven, and yet, when they saw it put by a nation with less sense of beauty, it was not quite so admirable. They remembered the epitaph of the "well-connected lady who was bland, passionate and deeply religious, who painted in water-colours, and sent several pictures to the exhibition; who was first cousin to Lady Jones, for of such was the Kingdom of Heaven." Well, the Greeks sent their well-born heroes to Elysium, but they also sent them to Tartarus, the Shades below. The whole idea of the Homeric Hades was that it was peopled by bodiless phantoms, shadowy, utterly cut off, and without influence, except in the rarest circumstances, on the life of the living. There was another thing that they had in these slabs—they had the memory of the cult of ancestor worship. They knew that the tombs of the Greeks, especially the Athenians, were the scene of constant ancestor worship, and the tenure of land in Athens very often depended entirely upon certain rites paid at the tomb. So that on the one hand they had the Homeric belief in the shadowy life of the soul, powerless to act on the living, and on the other they had this custom of ancestor worship. They could not reconcile the two, for they belonged to two different strata of population. It seemed to her that in Pelasgian Athens, which boasted that it was home-born and home-grown, they had in these grave reliefs a dim reminiscence of this ancestor worship. She did not think that the Greeks who put up these reliefs wanted to make out that their ancestors were gods, but she believed that they were under the spell of a long artistic and even literary tradition which taught them that their dead became gods, and that this tradition lingered in that most conservative of places—the churchyard. A good deal had been said of the extraordinary dignity, beauty and simplicity of the inscriptions on Greek tombs, but she thought they were apt to go too far about them. To her they seemed bald, for it certainly would be very easy to get a better epitaph than "So and so, daughter of So and so," and there was enough to admire in the Greeks without creating fictitious objects of admiration. Modern Christian epitaphs could beat those of the Greeks anywhere. So much that was beautiful had been said about the extraordinarily beautiful parting scenes of the Greeks by Dr. Mahaffy that she did not think there was any need for her to add anything by way of explaining their serenity and simplicity. Sometimes the parting was represented as taking place between husband and wife, sometimes between groups of women. The reliefs which represented the parting had scarcely ever any expression of at all violent grief; sometimes there was an expression of quite poignant grief, but still with a certain reserve about it. Dr. Mahaffy had been in Athens since she was there, and through his kindness she was about to show a specimen in which a seated woman and apparently a boy were saying farewell, and in which, as Dr. Mahaffy had said, they had just the expression of the physical weariness of grief, and whether it was the boy or the woman who was going to Hades the same observations applied. They turned with relief to similar scenes as shown in mythology, such as the parting of Orpheus and Eurydice, when they were, as it were, lifted into a higher atmosphere. This specimen was not a grave relief; it was probably a relief set up in memory of some dramatic exhibition; they had not the absolute calm of the expression. From these reliefs they gained an idea of the attitude of the Athenian in the presence of death, and they were irresistibly reminded of the words of Socrates, that to a good man no harm can happen in life or in death, and as he said, turning to his judge, "I go my way and you go yours. I go to death and you go to life, but which is the better God alone knows."

TESSERÆ.

Classic Architecture and Furniture.

WHILE English architects were content to put columns that supported nothing, roofs that covered nothing and parapets and balustrades that protected nothing; to put sham attics to hide the construction of ugly roofs, to make us peep through the scroll-work of a frieze or the channels of a triglyph instead of a window, or to make the pedestal of a statue into a chimney-pot, how was it likely to fare with furniture, which became a sort of toy architecture? Was it to be wondered at that all constructive shams were increased tenfold when used as ornament; was it surprising that Grecian stone altars formed our sideboards, Roman temples our cabinets, sarcophagi our sideboards and wine-coolers, or that our harpsichords stood on lyres instead of legs; that constructive truth, in short, was wholly and entirely disregarded, so that some favourite type was reproduced? Was it to be wondered at, moreover, that men broke loose from these dead shams, and getting sick of these classicalities, ran away from constructive truth and symmetrical arrangement altogether—went mad first after rococoism, and then, in our own days, after picturesque naturalism, and that the very revolution of taste produced the wildest contradictory faults?

New and Old Houses.

At no time does the bosom seem so completely exorcised of all the demons which too often infest its recesses than when we contemplate antique and modern mansions—the ruined and the recently erected castle, or abbey or manor house. In the latter case men look at the building with eye askant; they animadvert on the builder's extravagance, criticise his taste, or scoff at his folly; and even the philosopher cannot contemplate tower after tower, as day after day they rise prouder and higher, without peopling its chambers with prognostics of the future evils they shall witness, the unuttered groans with which they shall resound, until fancy converts it into the permanent abode of pain, visited only at shy and fleeting intervals by enjoyment and ease. Or perhaps utter indifference, more mortifying still, casts its careless gaze on the laboured magnificence of the rising fabric. What care we if this tower be like the Eagle Tower at Carnarvon, or that porch be modelled after the Gateway at Raby? what though its bowers be peerless and its halls the rivals of royalty? we are never likely to become its guest, and we pass on our way without so much as wishing the work "good speed." Not so much with the ruin; the most heartless or the rudest wayfarer cannot pass its ivied chasms and windy walls without somewhat arresting him, he knows not why or whence. The veriest booby that ever gaped does gape at its gigantic gloom; the clown, descended perhaps from the vassals of its former knightly or prelatic barons, and as ignorant of his own descent as of them, will talk with reverential awe of its aisles and turrets and prison vaults; while to the more enlightened mind each pillared arch and ivied stone pleads haughtily for glories gone. And why? Not merely from the grandeur of the pile, the fireside spells of its traditions, or the glories of its historical associations; but because man and his mutabilities have done with it for ever, and because its

stricken form addresses the heart as a thing exempt from the meaner contingencies of the world. The sepulchres of ages stand between us and it, and the hollow voice of Time sends over them from his remote recesses a challenge which at once awakens and subdues. The years that have enshrined its stones, if not the reverses it hath suffered, demand and obtain attention; and if chronicles have not stamped their painful illustrations on the structure, fancy busies herself in peopling it with her pictorial creations, and thus renders it more bright, if not less melancholy. The utter vacation from all human vicissitudes, the dead and dreadful desertion, the silence, the solitude, with their retinue of solemn imaginings, conspire to daunt and overpower the heart. It is as if we were to trace ancient stories in dark hieroglyphics, as if we communed with the harrowing but unintelligible whisperings of spirits, till our blood tingles and our hair stands on end at accents we cannot interpret.

Norman Characteristics.

Arches semicircular, occasionally stilted, at first plain, afterwards enriched with chevron and other mouldings. Piers low and massive, cylindrical, square, polygonal or composed of clustered shafts, often ornamented with spiral bands and mouldings. Windows generally narrow and splayed internally only, sometimes double and divided by a shaft. Walls sometimes a series of arcades, a few pierced as windows, the rest left blank. Doorways deeply recessed and richly ornamented with bands of mouldings. Doors often square-headed, the head of the opening filled with carvings. Capitals convex in outline, often grotesquely sculptured with devices of animals and leaves. Abacus square, lower edge moulded. Bases much resembling the Classic orders, the mouldings at first imperfectly formed. Pedestals of piers square. Buttresses plain, with broad faces and small projection. Parapets plain with projecting corbel tables under. Plain mouldings consist of chamfers, round or pointed rolls at edges, divided from plain face by mere notches. Enriched mouldings—the chevron, or zigzag, the billet, square or round, the cable, the lozenge, the chain, nail heads and others. Niches with figures over doorways. Fonts—circular, square, or polygonal, generally rudely and intricately carved, with massive bases or supported on pillars. Roofs of high pitch and open to the frame timbers, chiefly king-post trusses. Towers square and massive, those of late date richly adorned with arcades. Towards the close of the style, during the reign of Henry II., details often of transitional character. Pointed arch with Norman pier, arcades of intersecting semicircular arches. Norman abacus blended with Early English foliage in capitals.

Early Oil Paintings in Venice.

According to Zanetti, the first oil picture known to have been executed in Venice by a Venetian master was painted in 1473 by Bartolommeo Vivarini for the church of SS. Giovanni e Paolo. It does not appear that Antonello da Messina executed many pictures in Venice during his first visit there on his return from Flanders about 1445; and Domenico Veneziano, to whom he communicated his secret about 1451, was soon invited to Florence, where he was afterwards employed. Lanzi (vol. i.) appears to think that Domenico painted several pictures in Venice after his acquaintance with Antonello. Had this been the case, or had Antonello made known his secret at once to others besides Domenico (as Vasari in one place seems to say), oil painting must have been practised in Venice much earlier than 1473. The first oil pictures known to have been executed in Italy by Italian artists, in consequence of Antonello's communication, were those (now no longer existing) by Domenico Veneziano and Andrea del Castagno on the walls of the Portinari Chapel in Santa Maria Nuova at Florence. The execution of those works must have taken a considerable time, the middle period of which may have been about 1460.

The Via Sacra, Rome.

After the fire of the Gauls Rome, we are told, was generally rebuilt in a hasty and irregular manner, without regard even to the old lines of the streets or of the sewers beneath them. The lanes which choked the plains and hollows were tortuous and narrow, with lofty houses obstructing the light and air, while the hills were almost entirely occupied by the temples or by the mansions and gardens of the nobles. The names of a good many of the streets or alleys of the lower city are recorded, but there is hardly a single one that is known to have run over the summit of any of the hills—a significant indication that the great mass of the population was now confined, and indeed continued always to be confined, to the valleys. But indeed in all Rome there was at this time but one street that deserves the name of an avenue and offered a common thoroughfare for men, horses and vehicles. This was the line along which the procession of the triumphs passed, and it was for this and other sacred ceremonies that its width and straight direction were preserved. Entering the city at the Porta Triumphalis, near the south-west extremity of the Capitoline, the victorious general was conducted across the Velabrum into the Circus Maximus, and so, following perhaps exactly the line of the ancient pomærium, along the valley which separates the Palatine from the Cælian. At the spot now marked by the arch of Constantine, his route made another angle to the left, climbed the gentle slope of the Velia, at the top of which he came directly in sight of the Arx and the Capitol. From hence he descended, keeping the right side of the Forum, to the foot of the Capitoline, which he ascended, making another bend to the left, by the Clivus Capitolinus, till he reached the Temple of Jupiter. This road was dignified with the name of the Sacra Via. The Appian Way, which branched off from it, and issued from the city at the Porta Capena, was paved in 312 B.C. and the Flaminian in 220; but it was not till 174 that this care was extended to the streets in the city itself, and to the Clivus Capitolinus. Wherever the accretion of the soil has been removed in the line of the Sacred Way an ancient pavement, consisting of large angular blocks of basaltic lava, has been found still in admirable preservation.

Fresco Secco.

Secco is thus described by Theophilus:—When figures or other objects are drawn on a dry wall the surface should be first saturated with water till it is quite moist. While the wall is in this state the colours are to be applied, all the tints being mixed with lime, and drying as the wall dries, in order that they may adhere. Buon fresco cannot be executed on a large surface without joinings in the plaster. Secco may be executed without joinings, but the colours have not the brilliancy of fresco. The earliest example of buon fresco is supposed to be a work by Pietro d'Orvieto, painted in 1390, in the Campo Santa at Pisa.

Quasi-Transepts.

The modern practice of building quasi-transepts is generally objectionable. They are unsatisfactory in external effect when carried up to the height of the main roof, unless the intersection is crowned by a flèche or turret of some kind. They are expensive in construction, and in order to justify their cost are not unfrequently made the receptacles of deep galleries. A cruciform church, with a central tower or lantern, is of course a legitimate exception and quite free from these objections; but beautiful as this arrangement is architecturally, it may be questioned whether for our parochial churches it is the best model to follow, or so well adapted for the service of the Anglican Church.

GENERAL.

The Design for the rebuilding of the Royal Institution Colquitt Street, Liverpool, by Messrs. Briggs & Wolstenholme, 3 Lord Street, Liverpool, has been awarded the first premium of 50 guineas. The second prize of 20 guineas has been awarded to Mr. H. W. Bedingfield, of 5 Hotel Street, Leicester, The designs will be on exhibition at the Royal Institution until December 15.

Mr. George Dennis, who was vice-president of the Archæological Institute in Rome, died on the 15th inst. in his eighty-fourth year.

The Opening Meeting of the Edinburgh Architectural Association was held on Wednesday under the presidency of Mr. Thomas Ross, who delivered an address on "Plans of Early Scottish Houses," showing how the mansion-houses of the sixteenth and seventeenth centuries were developed from the keep towers and earlier strongholds.

The Site of 31 Walbrook, occupying about 1,800 superficial feet, was yesterday sold at auction for 18,900*l.*, the purchaser being Mr. Delissa Joseph, architect, on behalf of a client.

The Cambridge Engineering Laboratory Syndicate recommend that they be authorised to proceed at the end of the present term with the building of a wing to the Engineering Laboratory at a sum not exceeding 5,000*l.*; that the gift of Mrs. Hopkinson and her family be applied to this purpose, and that the wing be called the Hopkinson Memorial wing. That structural alterations in the existing laboratory at the cost of 500*l.* be carried out, such sum to be provided by the University.

Messrs. J. M. Dent & Co. have opened an exhibition of drawings in black and white and in colours. Amongst the artists represented are J. D. Batten, Aubrey Beardsley, F. D. Bedford, R. Anning Bell, C.E., and H. M. Brock, L. Leslie Brooke, Walter Crane, H. Granville Fell, Laurence Housman, William Hyde, Alfred Parsons, Herbert Railton, Charles Robinson, T. H. Robinson, E. J. Sullivan and Paul Woodroffe. Messrs. J. M. Dent & Co. have in the press a work by Mr. Godfrey Blount, of Pembroke College, Cambridge, entitled "Arbor Vitæ." The book treats of the principles of design as applied to the decorative handicrafts, and appeals to students in that branch of art.

A Monograph on the Crown Theatre, Peckham, has appeared. Mr. Rüntz describes his own excellent work and Mr. Sachs adds illustrations and notes. It is abundantly illustrated and will serve as a memorial of a building which is a model of a suburban theatre.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

WINDERMERE.—Nov. 23.—For alterations and additions to the Lancaster Bank. Mr. Robert Walker, architect, Public Buildings, Windermere.

LONDON COUNTY COUNCIL CONTRACTS.

ON July 26 last, on the recommendation of the main drainage committee, the London County Council accepted the tender of Messrs. John Penn & Sons, Limited, amounting to 16,900*l.*, for converting four beam engines at the Crossness sewage outfall into triple-expansion engines. In a letter which accompanied their tender, Messrs. Penn & Sons stated that they could not carry out the work under the conditions agreed to between the federated engineering employers and the joint committee of affiliated trade unions at the conclusion of the late engineering dispute, but that they did not anticipate there would be any great difficulty on that account. Subsequently, however, Messrs. Penn & Sons informed the Council's solicitor that they were unable to accept the conditions contained in the form of contract, and upon being asked to state in detail to what conditions they objected and what alterations they desired to have made, they replied by stating they could not then undertake the work. The main drainage committee reported that in these circumstances they could see no other course open but to accept one of the other tenders received on June 28. They passed over the next lowest tender as being one they could not ask the Council to accept, and recommended the acceptance of the next tender, that of Mr. B. Goodfellow, amounting to 20,864*l.*, as they were informed that this tenderer was capable of carrying out the work satisfactorily. The Council have now endorsed this recommendation, and the tender has been let to Mr. Goodfellow.

MISSING ASSESSMENTS IN THE CITY.

THE improvements and finance committee of the Corporation of London has had laid before it a report which shows that the Corporation is the loser of nearly 5,000*l.* per annum owing to the fact that large and valuable properties in almost every parish in the City have escaped assessment for many years past, while others have been unassessed owing to rebuilding operations. In addition, many warehouses and wharves on the river have never appeared in the rate-books. The loss in a group of seven City wards is estimated at 2,000*l.* a year. In one small parish nearly all the premises have been omitted in the rate-books, and have consequently not been assessed. In the majority of cases the sums unpaid are comparatively small, while in one or two instances the loss amounts to several hundred pounds. The report of the committee will be presented at a meeting of the Court of Common Council on Thursday, and in the meantime steps are being taken to insert the missing premises in the rate-books.

ELECTRIC NOTES.

THE Arbroath Town Council, as the Gas Corporation, have defined an area of over a mile in the principal business part of the town for the supply of the electric light, under the provisional order for which they have resolved to apply.

PHOSPHORUS is now produced by means of the electrical furnace. The method consists in heating a mixture of phosphate of lime and coke, which are first reduced to a powder. When the mass becomes pasty, the openings of the furnace are sealed except one, through which the vapour passes. The vapour is collected and distilled.

POWERS are to be asked by the Kirkaldy Corporation in the coming session of Parliament for the introduction of electric lighting. The scheme will apply to a large portion of the town, including High Street, and electricity will, in addition, become the traction power in connection with the system of tramways to be inaugurated, for the carrying through of which the necessary powers are also to be sought.

OFFICIAL notification has been given by the Urban District Council of Castleford, in the West Riding of Yorkshire, of their intention to apply to the Board of Trade, under the Electric Lighting Acts, for a provisional order to empower them to produce, store and supply electricity. The Keighley Corporation also notify their intention to apply for electric-lighting powers, and the Mexborough Urban District Council are seeking a similar authorisation. The Mirfield Urban District Council intimate that they intend to apply for power to supply electric light and power within their district.

MUSSELBURGH Town Council held a special meeting last week, at which there was discussed the expediency of establishing an electric-light supply for the burgh. It was decided in the first place to take action to oppose the application of a London syndicate for powers to establish a supply in the burgh. A special committee was then formed to consider the whole question with the assistance of an electrical expert, and to establish whether or not a municipal electric scheme would be a profitable venture.

A MEETING of the Heckmondwike District Council was held on the 14th inst., when a communication was read from the Board of Trade calling attention to the expiration of the Council's provisional order (1891), authorising borrowings for an electric-light installation. The clerk was instructed to reply explaining the Council's position on the question. In reply to a letter from the local Tradesmen's Association, the chairman stated that the Council never intended pledging itself to any scheme of electric lighting, electric traction, or any other venture involving the spending of a large sum of money, without first taking the ratepayers into their confidence.

AT a special meeting of the Durham Urban District Council held in the Mayor's Chamber to take into consideration the desirability of applying to the Board of Trade for a Provisional Order under the Electric Lighting Acts, 1882 to 1890, authorising the local authority for the city of Durham to supply electricity for any public or private purposes within the district of the local authority, the report prepared by Mr. W. C. C. Hawtayne, C.E., of Mansion House Chambers, London, was read, and after some discussion the following resolution was put and carried unanimously:—"That this Council being the local authority for the purpose, under the Electric Lighting Acts, 1882 to 1890, memorialise the Board of Trade for a Provisional Order authorising this Council to supply electricity for any public or private purpose within the district of this Council, and that all the necessary notices of such application be prepared and published as required by the said Acts or any rules made under the same."

THE streets, shops and Promenade of Llandudno were for the first time on the 5th inst. illuminated with the electric-light. There was no public celebration of the event, but a number of the Llandudno Urban District Councillors assembled at the electric works by invitation of Mr. A. H. Preece, the engineer of the scheme, to witness the first "switching on" of the light by Mr. T. T. Marks, C.E., chairman of the Council. There were also present Mr. W. H. Preece, president of the Institution of Civil Engineers, Mr. W. A. Darbishire and others. The plant of the new generating station consists of three Babcock-Wilcox boilers, two of which will be fired from Beaman & Dea's destructors, while the third will be hand-fed with coal or coke; the whole of the boilers may be fired with coal or coke by hand if necessary. The proximity of the electric light and gas departments, each a municipalised undertaking, combines convenience with economy in the matter of fuel. The refuse destructor is one of most modern approved construction. The same may be said of the engine-room, which is at present equipped with two 100-kilowatt dynamos and one 50-kilowatt dynamo, together with a motor generator for regulation and for charging the batteries. The two principal generating sets are each capable of giving an output of 100 kilowatt at 440 to 500 volts. There is also a third generating set,

Portable Cistern Filters.

157 STRAND, W.C. (Four Doors from Somerset House), LONDON.

capable of giving an output of 50 kilowatt at 600 volts. A balancer is provided, each armature capable of carrying a current of 100 amperes, and working at a voltage varying between 200 and 256 volts, so that it can transfer 25 kilowatt from one side of the three-wire system to the other. For the street lighting there are altogether 48 arc lamps erected on cast-iron pillars. The lamps along the front of the Promenade, thirty in number, as well as those of important crossings, are fixed in carriers, protected from the weather by a canopy—an ornamental as well as useful appendage. The remaining eighteen lamps are all fixed along the kerb at the side of the road, suspended from overhanging brackets. The lamps are run in groups of eight in series, and are of the well-known Crompton-Pochin type. Fitted with opalescent globes, they are for single carbons, burning for eighteen hours without re-trimming. Each lamp is provided with an automatic "cut-out," which in the event of the lamp "hanging-up" from any cause immediately "short circuits" it so that the other lamps in that particular circuit are not extinguished. The lamps on the sea-front are fixed about fifty yards apart, those in the town at a slightly greater distance.

AT a special meeting of the Northallerton Urban Council it was decided to grant Mr. J. E. Hutton, electrical engineer, permission to establish works to light the town. Mr. Hutton proposes to form a company, and will put down two lights free of cost. It was also decided to ask the Sewage Purification Company to state when they will hand over their works to the Council.

TRADE NOTES.

THE County Infirmary, Downpatrick, is being warmed and ventilated by means of Shorland's patent Manchester grates.

MESSRS. SANKEY & SON, of Iron Bridge and Essex Wharves, Canning Town, London, E., write us that they have purchased the business of Messrs. A. Gregory & Co, lime, cement, brick and sanitary goods merchants, carried on by them at Plumstead, Woolwich Arsenal, S.E.R., Bexley Heath, and Erith, and the same will be carried on by them in future.

IT is satisfactory to note that the fire protection of the Metropolitan Tabernacle, now being rebuilt, has received adequate attention, the architects, Messrs. Searle & Hayes, having instructed Messrs. Merryweather & Sons to provide one of their high-pressure fire-mains and other fire-extinguishing appliances.

MR. CHATWOOD, of Chatwood's Patent Safe and Lock Company, Limited, is now on his way from Egypt, where he has received instructions for the manufacture and erection upon the premises of the banks at Cairo and Alexandria of steel strong-rooms measuring in each case about 40 feet in length, with internal bullion safes, &c.

BUILDING AND BUILDERS.

A NEW Primitive Methodist chapel is to be built at Daisy Hill, Bradford Fourth, Yorks.

THE foundation-stone of the new church of St. John, at Hessay, near York, was laid on the 9th inst. The cost of erection will be about 850*l.*

A LABOURER named Thomas Halloran, of Rose Hill, Bolton, was killed last week by a fall at the new Victoria Mission Hall, Knowsley Street. He was at work on a scaffold when he missed his footing, and fell 30 feet, dashing his head against a brick.

IN the recent open competition for schemes of sewerage, sewage disposal and water supply for the district of Wivenhoe, Essex, those submitted by Messrs. Sands & Walker, civil engineers, Nottingham, have been selected as the best and unanimously adopted by the Council.

THE Goole School Board have awarded the first prize to the competitive plan of Mr. Tennant, architect, of Pontefract, for the swimming baths which they intend to erect at Alexandra Street schools, and the second to Mr. H. B. Thorp, architect, of Goole.

MR. A. M. TORRANCE, chairman of the fire brigade committee of the London County Council, on Saturday laid the foundation-stones of two new fire stations. One is to be at Mary Ann Street, Woolwich, and the other at High Street, Lewisham.

THE Goole School Board and the Goole Urban Council are at present both undertaking to provide the town with swimming baths, and in consequence of this dilemma the Urban District Council held a special meeting and passed a resolution asking the Education Department to prohibit the School Board from proceeding further with their scheme for providing baths, especially as the Urban Council had agreed to accommodate school children at a halfpenny per head.

H. MUNZING. 199 UPPER THAMES ST., LONDON, E.C.

THE town hall committee of the Colchester Town Council have decided to recommend the Council to accept the tender of Messrs. Kerridge & Shaw, of Cambridge, for 37,000*l.*, for the erection of the new town hall. The cost of the Victoria Tower will be borne by Mr. J. N. Paxman, the ex-mayor.

THE memorial-stones were laid on Tuesday of new Sunday schools in Vine Street, Coventry. They are to be erected at a cost of 1,500*l.*, will be two storeys in height, contain eight classrooms and accommodate 520 pupils.

A WORKING-MAN engaged on some repairs in Serjeants' Inn, London, on Monday fell from the roof on spiked railings beneath, from which he was removed by some passers-by. The man, who was unconscious and evidently terribly injured, was taken to King's College Hospital.

THE strong and influential committee that has been formed to erect a memorial church to the memory of the late Dean Vaughan met on Saturday last at the Church House, when the drawings of Messrs. J. E. K. & J. P. Cutts were approved, and the work is to proceed forthwith. The church is to seat 750 people at a cost of about 10*l.* per sitting, exclusive of the tower and spire shown on the design, and which is to be erected at a future time.

WITH reference to the proposal by the Caledonian Railway Company to construct a bridge across Argyll Street, Glasgow, which will form a continuation of the existing bridge as far as the east side of Hope Street, the Broomielaw ward committee have appointed a special sub-committee to act along with their municipal representatives. A special sub-committee of the Clyde Trust has been appointed to consider the proposal of the Caledonian Railway Company to erect a bridge across the Clyde at Broomielaw.

THE memorial-stone of a new Baptist chapel for Longsight was laid on the 12th inst. The new building, which will accommodate over 500 persons, has a frontage to Slade Lane, and will be an ornament to this rapidly growing suburb. The architect is Mr. Thomas D. Lindley, of Ashton-under-Lyne. The building will be in Gothic style. At the rear of the chapel there will be a lecture-room, which for the present is to be used as a Sunday school, although the site is sufficient for a school, which will be built at a later period. Both the chapel and lecture-room will be supplied with the electric light, and the total cost of the land and buildings, including furnishing, will be 3,700*l.*

THE scheme of the Workington Corporation and iron-masters for a deep-water dock at Workington having fallen through, the Maryport Harbour Commissioners have decided upon a large scheme of dock extension. They propose to incorporate a company under Act of Parliament to buy the harbour estate, and provide additional modern accommodation for increasing the trade of West Cumberland. Particulars will shortly be submitted to the bondholders, and if the negotiations proceed satisfactorily a Bill will be introduced next session. It is claimed that the Commissioners' scheme would give all the dock accommodation required by the West Cumberland iron trade, and that the building of a large dock at Workington would result in neither Workington nor Maryport harbours paying.

A SERIOUS accident occurred last Friday morning in a building in the course of erection at the corner of George Street and Dundas Street, Glasgow. Two bricklayers and a labourer were working on a scaffold, about 16 feet square, and situated fully one storey high, when from some cause unknown one of the supporting cross-beams gave way, and the men fell to the ground, a distance of about 30 feet. Two of them received severe injuries, and had to be conveyed to the Royal Infirmary in an ambulance waggon. The third man was able to walk home. It is an interesting fact that the men had been newly engaged, and had just started work at 10 o'clock when the accident took place. The foreman mason had a narrow escape, as he was standing on the scaffold a minute previously, and had just gone over to work at another part of the building.

THE bricklayers' strike in Hereford has been settled after existing eight months. A delegate from the Operative Bricklayers' Society has been down from London, and terms a little better for the master builders than those previously offered have been agreed upon. Among other things it has been agreed that the walking time to work shall be paid for after the first mile and a half (instead of the first mile); that messrooms shall be provided for men on all jobs where practicable (the last two words being added to the previous condition); that the wages shall be 7½*d.* per hour for skilled labour, superior workmen to be rated by the foreman or employer; that six months' notice shall be given to terminate any of the rules, such notice to expire on November 1, and that the rules as now agreed upon shall remain in force for two years from this date. The local bricklayers refused to sign the agreement, but it was taken up to London, where it was signed by Mr. John Batchelor (the London secretary of the Operative Bricklayers' Society), and

therefore it becomes binding. The men have also had notice from the Society that they are at liberty to resume work.

At the usual monthly meeting of the Morecambe District Council, Mr. T. Baxter presiding, over forty sets of plans were submitted, these including plans for the erection of a new hotel, to be called the Park Hotel, on the site of the Regent Park Pavilion, which is about to be demolished. Plans for several new streets were submitted and approved. A memorial was presented by the Morecambe technical instruction committee asking the Council to provide a town's institute, to be used as technical schools. The site suggested was near to the place where the new Board schools are to be erected. On the casting vote of the chairman it was decided to purchase 860 yards of land from the Midland Railway Company for 2,050*l.* The census of the township has recently been taken, and shows the present population to be 11,000.

A PROPOSAL is on foot for utilising part of the site of the Brighton Aquarium for the construction of a winter garden. This will involve, says the *Daily News*, various structural alterations, regarding which, according to the terms of the Company's Act of Parliament, the Brighton Town Council have certain rights. In order to facilitate the negotiations, it is contemplated by the syndicate which has the matter in hand to offer the Town Council opportunities for materially improving the marine parade, or at any rate that portion of it which runs the entire length of the Aquarium Company's building, that is to say, from the Old Steyne eastwards to the site of the now vanished Chain Pier. At this latter point the broad esplanade that runs from the eastern boundary of the borough (Kemp Town) is checked by the flight of steps that lead to the beach, and thenceforward to the Steyne becomes much narrower. The proposals now under consideration have as their object the widening of this part of the esplanade, which, instead of following the concave shape of the cliff, would be brought out into practically a straight line, being thus widened by from 15 to 25 feet. Skeleton erections have been placed *in situ*, so as to indicate the important improvement which would thus be effected. A sub-committee of the Council has the matter under consideration. Meanwhile, progress is being made with the new Palace pier opposite the Aquarium (with which undertaking, however, it has no connection). The pier has already been carried out to about 1,600 feet, and, though it will not then be finished, it is hoped that this portion of it will be planked and available for promenading during next spring.

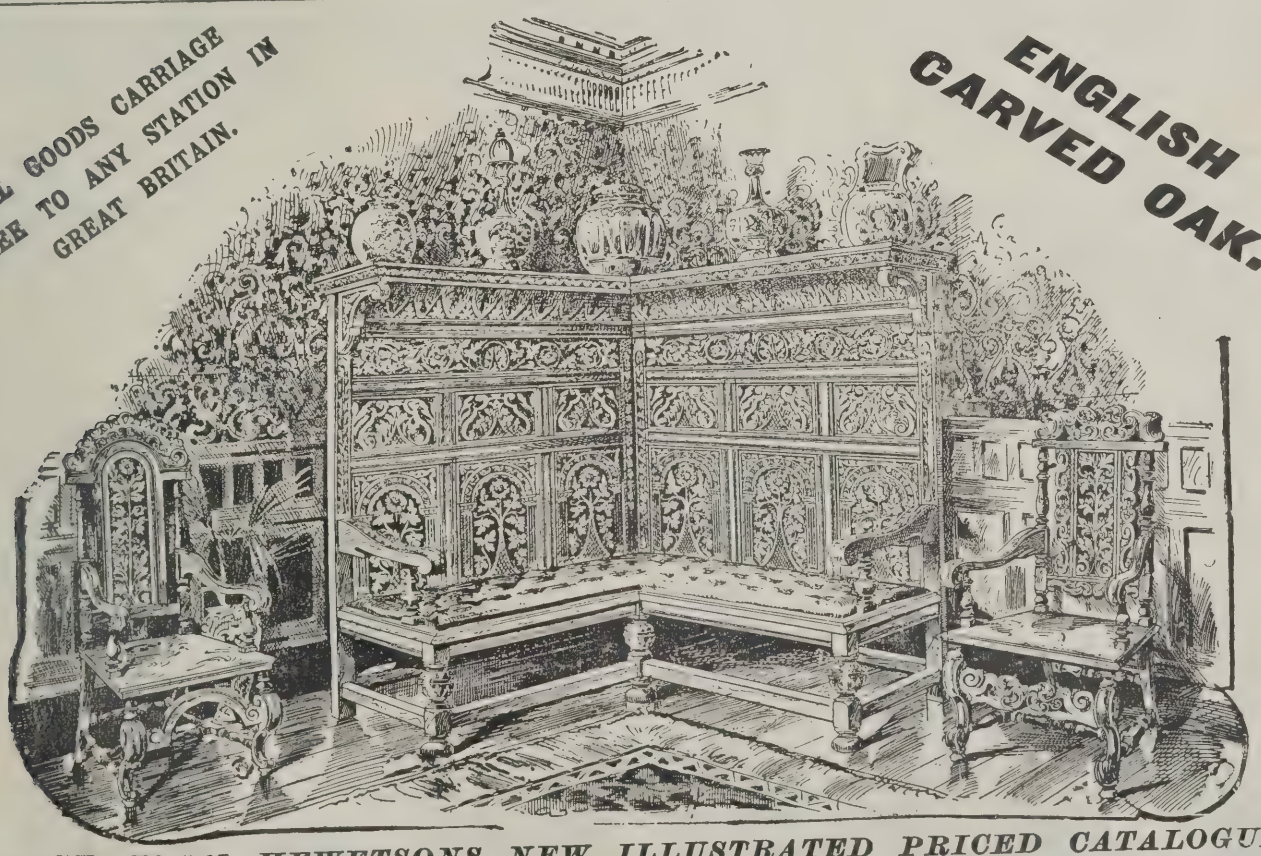
THE extensive sawmills worked by Messrs. Oxley Brothers, at Doncaster, have been entirely destroyed by fire.

THE new Nurses' Home and Dispensary attached to the Ormskirk Cottage Hospital, and which have been erected at a cost of between 2,000*l.* and 3,000*l.*, was opened on Saturday afternoon.

THE special plant which has been in use in the construction of the harbour extension works at Dover, now rapidly approaching completion, is to be removed to the Tyne, the Tyne Commissioners having accepted the tender of Sir John Jackson, Limited, to rebuild the North Breakwater at a cost of 440,000*l.*

THE Preston Theatre Royal, which has been reconstructed from designs by Mr. John P. Briggs, of Arundel Street, Strand, and is now a very handsome and commodious theatre, with a stage large enough for the most elaborate spectacle, was opened on the 31st ult.



AN adult Sunday school, erected by the Society of Friends at Paddock, Huddersfield, was opened on the 12th inst. The building has been constructed from plans by Mr. J. Berry, architect, Huddersfield, at a cost of about 1,200*l.* The school occupies the site of the original meeting house.

PRINCESS MARY'S Convalescent Home, Bognor, was opened with some ceremony on Wednesday. The building is separated from the sea by a wide, green field. There are twenty-eight beds, the staff comprising three nurses and a matron, while accommodation is provided for one or more nurses from the Shadwell Hospital who may require rest and quiet. The total cost, when completed, will be 7,200*l.*

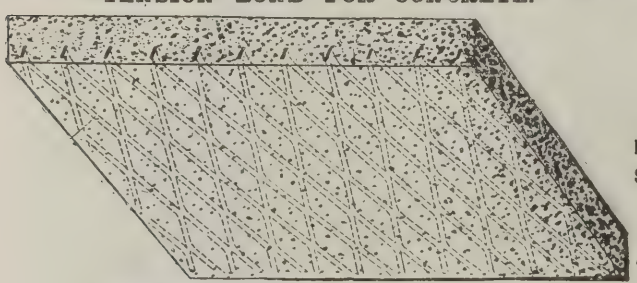
Hotel, Portrush, and contains coffee-room, drawing, writing and smoking-rooms, and baths and lavatories for both ladies and gentlemen, and twenty-seven bedrooms, all upon two floors.

TEMPSFORD HALL, Bedfordshire, has been completely destroyed by fire. The mansion, rebuilt on the site of the old hall, was composed of red brick and Dumfries stone, and was the residence of Major Dugald Stuart, whose father, the late Colonel Stuart, was for many years member for Bedford. Among the contents was the trunk of the first tree cut down in Pennsylvania by William Penn.

IT has been decided to restore the Palace of Versailles, and the not less celebrated Trianon, for the Paris Exhibition of 1900. The Minister of Fine Arts has asked Parliament for a vote of 300,000 francs for the purpose. The famous crystal gallery, where the Kaiser's illustrious grandfather was proclaimed Emperor, will be renovated, the orangerie will be repaired, the façades of the palace towards the park restored, and the Grand and Petit Trianon, which now look neglected and are becoming dilapidated, will also be put into a state of thorough repair.

NORTHWICH has again experienced the devastating effects of the brine-pumping operations, which to a great extent support while (in another sense) undermining the town. An alarming subsidence in the London Road has occurred which, according to latest advices, already measures 180 feet long, 160 feet wide and 12 feet deep, and is "still growing." Buildings are thrown in some cases as much as 4 feet out of the perpendicular, and present an extremely woebegone and uncanny appearance.

A MISSION HALL in connection with St. Aidan's parish, Belfast, has been opened by the Lord Mayor of Belfast. The hall occupies a convenient site at the corner of Tierney Street, on the Donegall Road, and is situated in what may be termed the slum district of Belfast. It has been designed by Mr. T. H. Jackson, architect, and built by Messrs. Courtney. It is of brick, and has a spacious hall on the second floor which will accommodate about 300 persons. The ground floor contains three convenient classrooms and other apartments. The building cost about 1,250*l.*



A NEW infants' school in connection with Hunslet Carr Board school, the fifty-sixth school built by the Leeds Board, was formally opened on the 10th inst. Situated in Woodhouse Hill Road, on a site containing 3,649 square yards, the new premises will accommodate 530 children. Both internally and externally they are a credit to Mr. W. S. Braithwaite, the architect to the Board. On three sides of a central hall are classrooms, and on the fourth cloakrooms. One large room provides for 110 children, and in a smaller one 60 babies may be cared for. The total cost, including site, has been 6,200*l.*

AN international conference was held at Dover on Friday last for the purpose of considering what steps can be immediately adopted to obviate the serious inconvenience caused in the outer harbour at Dover, with certain high winds, which render it dangerous for the mail boats to use the Admiralty Pier. The authorities represented included the English railways running to Dover, the Northern of France Railway Company, the Belgium Government, the Dover Harbour Board and the engineers, Messrs. Coode, Son & Matthews. As a result of the conference it is understood that the lengthening of the Admiralty Pier, which forms a part of the National Harbour scheme, will be pushed on with the utmost possible speed. As soon as this is run out far enough to overlap the East Pier, it will intercept the tidal currents. The whole difficulty will thus be overcome, and there will be absolutely calm water in Dover Harbour in the heaviest westerly gales.

THE death of Mr. Alexander Tait, solicitor and town clerk, Grangemouth, took place on the 10th inst. at his residence, Janeville. The deceased gentleman, who had been in delicate health for some time, went to Grangemouth about twenty-seven years ago, and on Grangemouth being formed into a burgh in 1872 was appointed town clerk, which office he filled up to his death, and fulfilled his various duties to the satisfaction of the community. He held a number of other public offices, being registrar to the town, and for a number of years secretary to the Grangemouth branch of the Stirlingshire Liberal Association. He was also for some time clerk and treasurer to the School Board, manager of the Grangemouth Traders' Building Company, Limited, and session clerk to the parish church, &c. He devoted himself zealously to the work of the burgh, and was much respected in the district. He is survived by a widow and a son and daughter.

MR. W. A. DUCAT, representing the Local Government Board, attended at the Blackpool Town Hall on the 10th inst. for the purpose of holding an inquiry as to an application of the Corporation for sanction to a loan of 8,100*l.* for the extension of municipal buildings, including a town hall and offices. The town clerk (Mr. T. Loftos) said that 8,100*l.* was necessary to purchase land which was indispensable to the Corporation, as it was wanted for the extension of the town hall. The land,

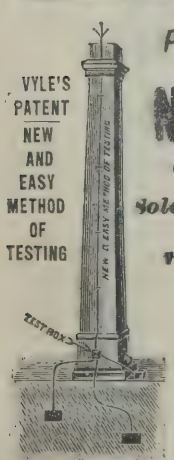
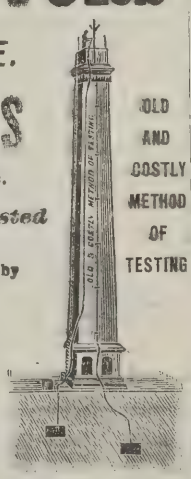
PRICE LIST AND ESTIMATES ON APPLICATION.

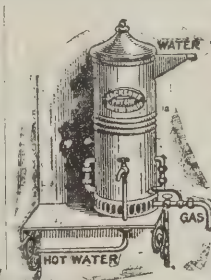


which was situated in Talbot Square and had business property built on it, was in one of the busiest thoroughfares in Blackpool. Originally, when the application was first made the Council could only borrow for thirty years, but by the Blackpool Improvement Act of 1898 they were entitled to a term up to forty years, and the Corporation desired sanction for a loan to cover that period. Figures given by Mr. Heyes (borough treasurer) showed the rapid growth of the town. The census, according to the borough treasurer, in 1891 gave the population as 23,846; at the present day it was said to stand at 42,800, exclusive of the visiting or floating population in the season. The decision of the Local Government Board will be reported in due course.

MR. C. WILLIAM TAGG, vestry clerk of Camberwell, presided over a largely attended meeting of the Superannuation Conference (convened by the Municipal Officers' Association) held at 117 Holborn, E.C., on Monday, November 14. The hon. secretary reported as to the replies received from the associations and societies who had been invited to send delegates and as to promises of financial support, and pointed out that it would be useless for him to continue to act as the hon. secretary unless the officers were prepared to give the movement more financial support, as it was quite impracticable to carry on an active campaign with the small amount subscribed during the last twelve months. The chairman in his remarks dwelt upon the absolute necessity of unity amongst officers, and that they must be prepared to find the necessary funds if they wished the Bill to become law. It was ultimately decided, in addition to asking the associations and societies sending delegates to the conference, to make an appeal to officers throughout the country to subscribe to a "Special Superannuation Conference Fund." At the request of the chairman a special committee was appointed to consider important proposals with regard to the Bill to be submitted in the next session of Parliament. The conference unanimously expressed its continued and unabated confidence in the chairman and hon. secretary for their conduct of the Local Authorities Officers' Superannuation Bill. Subscriptions to the special fund should be sent to the hon. secretary (Mr. C. J. F. Carnell) 117 Holborn, London, E.C.



IN the course of some excavations necessary for the putting in of the foundations of a villa to be erected near Hammersmith Bridge, there has been found, some 9 feet below the surface, the paved floor of one of those Roman villas which, in the palmy days of the Roman occupation of Britain, abounded along the Thames Valley. The design of the pavement consists of half-circles, circles and triangles, bordered with what appear to be geometrical patterns or figures. In the area of the circles are depicted leopards and sea-dragons pursuing dolphins; in the centre compartment are dogs chasing foxes. In the spaces between the circles and the triangles are drawings representing the heads of Neptune, Venus, Jupiter, Mars, &c. Another design, in remarkable preservation, is believed to represent Actæon attacked by his hounds. There are also heads of Flora and of Ceres, Silenus mounted on an ass, a fine head of Medusa, and a vine-leaved Bacchus. These tiles are laid upon a bed of what appears to be a kind of concrete, supported upon brickwork, which again in its turn rests upon rammed-down clay, and the whole must have taken an immense time to execute.



LEEDS architecture has gained materially by the erection of Messrs. William Brown & Co.'s new banking premises in Park Row. These handsome premises have been erected from the designs of Mr. Alfred Waterhouse, R.A., and cover an area of nearly 100 feet by 80 feet. The frontage to Park Row is 80 feet, to Greek Street and Russell Street about 100 feet. From the street level to a height of 26 feet the exterior is of polished grey Dalbeattie granite, relieved with courses and pillars of red granite. Above the granite the structure is faced with glazed buff terra-cotta. There is thus a striking but not disagreeable contrast, and the material having a polished surface the smoke will little affect it. The pavilions rise to a height of 90 feet above the street. The entrance to the bank from Park Row is a handsome feature. Double sets of swing doors give admission to the bank, a large, lofty apartment, lined throughout with faience from the Burmantofts branch of the Leeds Fire Clay Company. The colour scheme of this embellishment is light buff, relieved with brown and blue, whilst the capitals of the pillars supporting the ceiling are picked out in gold. The counter is 70 feet long, sufficient for ten cashiers. Behind it a screen, about 6 feet high, divides what may be termed the public portion from that occupied by the rest of the staff. The managers' rooms are at the rear, and they also display some beautiful faience work. In the basement, covering an area of about 75 feet by 50 feet, are the strong-rooms, where the bullion, bank-books, &c., are stored. These have arches of firebrick, upon which rests solid concrete 4 feet in thickness. The floor is likewise of concrete. The bullion-room is lined throughout with hardened steel plates. One of these six chambers contains the bank ledgers for the past fifty years. A

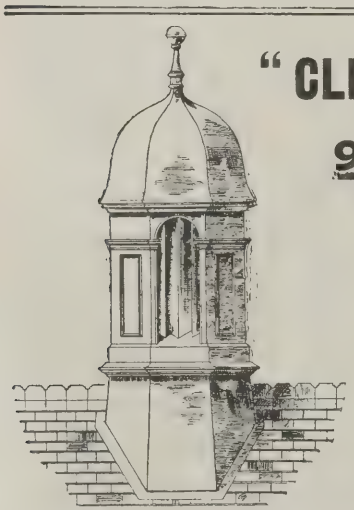
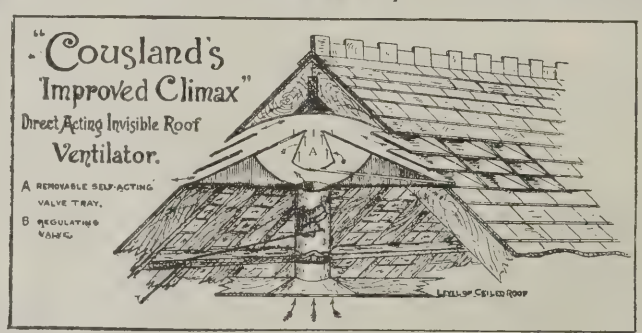
self-locking lift conveys the bullion, books, &c., from the bank to the strong rooms beneath when business for the day is over, and back to the bank in the morning. A large, well-lighted luncheon-room and other accommodation is provided for the staff in the basement. On the upper floors of the building are commodious suites of offices, some fifty rooms in all. Strong-rooms are also provided. The entrance to these upper floors is in Greek Street, and they may be reached both by staircases and by a lift. Most of the offices are already let. The whole of the building is of fireproof construction, and ventilation has been adequately provided for.

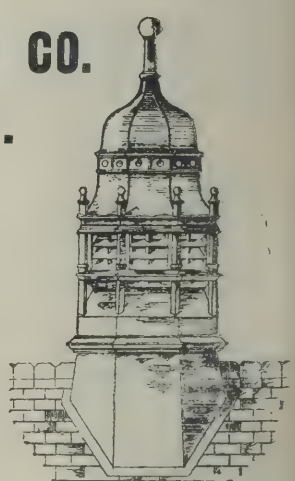
THE important extension of the Dunfermline Cottage Hospital, which is to be known as the "Moray wing," as the cost of its erection was derived from a grant of 5,000*l.* from the trustees of the late Earl of Moray has just been opened. The additions consist of four new wards, each providing accommodation for three beds, together with bath-rooms and all conveniences. The extension also embraces a new operating room, a doctor's room and a nurse's duty room. The existing wards on the second flat are to be utilised for the accommodation of the nursing staff and servants, so that all the wards are on the ground-floor. The extension is to the east and north of the main building. A long corridor running eastwards leads to the new wards. The operating-room is situated in the north side of the corridor. This room is one of the features of the extension. It is admirably designed and fully equipped in every way. In order to prevent germs lodging about the room, there is not such a thing as a corner in the whole apartment, all the angles being rounded off. The walls are lined with a special cement, and the room can be flushed with water from floor to ceiling. Special attention has been devoted to the lighting of the chamber. The furnishings are of the most complete description. The room is believed to be one of the best of the kind in the country, being particularly well adapted in every respect to the purpose for which it is intended. A brick building, known as the observation block, has been erected to the east of the present laundry, a short distance from the main buildings. The block consists of two wards, with one bed in each. Accommodation for a nurse is also provided. This building is set apart for the treatment of doubtful cases. That is to say, a patient will be taken there if there is the least suspicion of any infectious trouble.



THE Middlesex County Council held a special meeting on Monday to consider further the question of rebuilding Kew Bridge In view of the fact that Surrey agreed to accept Mr. Gibb's tender and seek a fresh Bill, the Middlesex Council now resolved to do the same. Mr. Burt of Highgate expressed his opinion that the plans did not show a bridge of sufficient width to meet the increasing traffic. The chairman (Mr. R. D. M. Littler) concurred, but said that under the terms of the tender it would be open to require the contractor within six months to increase the width. Mr. Burt then gave notice to move at the next meeting that it should be an instruction to the joint committee to increase the width to 50 feet.



NEW GENERAL POST OFFICE, LIVERPOOL.



THE new General Post Office which has arisen in Liverpool from designs by Mr. Henry Tanner, chief architect of the Office of Works, and which has occupied about six years in erection, is now rapidly approaching completion, and it is expected that by Easter it will be in occupation and full working order. The architecture is in the Italian Renaissance style, and while symmetry has been sufficiently considered, the elevations have been judiciously broken up to produce an agreeable effect of light and shade. The site, which is central, covers two acres, and cost about 140,000*l.*; that of the building is estimated at 200,000*l.* The front elevation is in Victoria Street. One side flanks Sir Thomas Street, the other faces Stanley Street. Behind these buildings is a large yard for postal van traffic, with openings into Sir Thomas Street, Cumberland Street (a little street leading into Whitechapel), and Stanley Street. The new office is about equi-distant from all the railway stations, and is in the heart of business Liverpool. The length of the Victoria Street frontage is 223 feet, and from the street level up to the roof there is a height of 83 feet. Measured from the basement level the height of the five storeys is 96 feet. The Stanley Street elevation is 260 feet in length. At its Whitechapel end are two openings into the loading yard. The lower part of the yard is open, the upper part next the new building has a glass roof 50 feet by 178 feet.

The elevation to Thomas Street has a length of 25 feet. The whole of the interior is remarkably light, roomy and well fitted. The entire structure is fireproof. Each floor is supported by iron columns, and consists of a steel framework of joists and girders filled with concrete. Thirty hydrants are distributed throughout the building and placed where they may

be readily accessible. There are fireplaces and cooking ranges, but the general scheme of heating is by hot-water apparatus. Gas finds a use only for heating the wax pots, and electricity is the sole artificial illuminant, the Office of Works itself making the installation. Every room has an abundance of ventilators, both Kershaw's and Ellis's having been freely introduced. The windows are all fitted with plate-glass, and "murillo" glass is used in inside glazing. Messrs. Henry Johnson & Sons, of Pembroke Place, plastering, concreting, tiling and granolithic (corridors, &c.). Messrs. Wilby & Sons, 75 Falkner Street, plumbing and painting. The common bricks were supplied by the Ravenhead Brick Company, St. Helens; buff-facing bricks by Ashton Hall Brick and Coal Company; glazed bricks by Dennis, of Ruabon; Messrs. Easton & Anderson supplied the heaters, and Doulton's provided the sanitary appliances. The steel and iron work was done by Messrs. E. C. & J. Keay, Birmingham; and the wood fittings were supplied by Messrs. Brown & Backhouse, Liverpool; Pearson & Brown, Eccles, Manchester; W. Thornton & Sons, Liverpool; Delaney & Shanks, Birkenhead; and A. White & Sons, Liverpool.

APROPOS of the recent difficulties with the electric light in the city of Edinburgh, the following communication has been officially made to the press:—Some inconvenience has lately been experienced by users of electric light in Edinburgh through deficient pressure from five to seven o'clock P.M. This result has been caused primarily by the extraordinary demand for light and the non-delivery of machinery ordered a year ago. Of four large machines which were intended to have been delivered and running in August last, only one has until now been in operation. Of four boilers, also ordered a year ago, and intended to be in operation in August, only two have been fully at work, and when the other two were put on last week certain alterations in connection with smoke flues were found to be necessary. These could not possibly be carried out at the present stage owing to the heavy load, and a temporary expedient, in the shape of an iron chimney, has had to be set up, with a fan for induced draught. This has now been set in motion, and to all appearance it is likely to be fully successful, but a day or two may elapse before the full benefit is obtained. Everything possible has been done by the engineers to lessen the inconvenience, but the work has been of such a nature that an immediate remedy was impracticable.

THE GROWTH OF LONDON.

ON Monday Mr. Robert Vigers delivered his presidential address at the Surveyors' Institution, Savoy Street. There was a large attendance. Speaking as a surveyor of fifty years' standing he had, he said, seen the open spaces taken possession of by the extra two millions of people who had had to be provided for during that time. The population within the administrative county of London had risen from 2,363,374 in 1851 to 4,232,118 in 1891, or about 56 persons to the acre. The number of inhabited houses was 306,064 in 1851 and 548,315 in 1891. The serious problem was how to provide a population increasing at the rate of about half a million in ten years with the proper means of internal communication. Speaking broadly, the bulk of the heavy traffic of London was between the north and south, or the termini of the great railways on each side of the river. The lighter traffic and the ebb and flow of the pedestrian tide was, on the other hand, mainly from east to west. They might wonder what the state of things would be in twenty or thirty years' time, and yet nothing had been done to mitigate the growing inconvenience. The widening of the footpaths had scarcely been considered. The system of the tube railways would probably absorb some of the foot traffic, but their carrying capacity would soon be reached, and wider roads and pavements and new arteries for wheeled traffic would become imperative. What had hitherto been done was mere tinkering, and an enormous expenditure would have to be incurred in further widening streets like Oxford Street, Holborn, the Strand, Fleet Street and Ludgate Hill, which were originally laid out for a population one-tenth the present size. The value of property had enormously risen in the City, and he had purchased for 73,000*l.* property for which the grandfather of the vendors had given 1,500*l.*

THE HOTEL CECIL.

AN ordinary general meeting of this company was held on the 10th inst. at the Hotel Cecil. The report of the directors stated that the directors had gone carefully into the question of the "Strand Front," and having taken into consideration the difficulties which would arise if the property were let on a building lease, they had arrived at the conclusion that it was

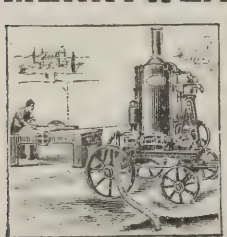
most desirable in the interests of the company to complete the scheme. Satisfactory financial arrangements had accordingly been made, and the building would be completed as expeditiously as possible. Meanwhile the interest on the 200,000*l.* debentures and the interest on the loan of 70,000*l.* (both of which had been specially applied in the acquisition of the property) was being charged with the other expenditure on the Strand front to that account, as part cost of the undertaking.

Colonel Carrington, the chairman, said the directors wished to congratulate them on the decided improvement in the current year's trade. The directors had gone carefully into the question of the Strand front, and it had been much modified by the terms on which the money was to be obtained. But for the arrangement they had made they would have had to hand over the Strand front to a speculative builder. He thought the company should have the advantage of any profit to be made there, and plans were already drawn which would result in a building being put up which would be a source of profit to the hotel. The site was an important one, and it would have been little short of madness to hand it over to a tenant for a period of ninety-nine years. They had decided to erect the Strand front themselves, and shortly the building would be in course of erection.

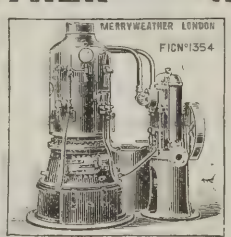
VALUE OF A HUNTING BOX.

THE president of the Surveyors' Institution, Mr. Robert Vigers, sat on Monday the 14th inst. as arbitrator in the case of Peareth *v.* The Great Central Railway Company, a claim for compensation in respect of 12 acres of land acquired by the railway company in crossing the Thorpe Mandeville estate, near Banbury, Northamptonshire, for the purposes of a connection with the Great Western Railway. It appeared that the Thorpe Mandeville estate comprised about 590 acres and a house, which had been specially arranged for the use of hunting tenants. It had, until the construction of the new line, been some distance from a railway, and had commanded a rental of from 350*l.* to 500*l.* a year, furnished. It was submitted that the value of the agricultural portion of the property was seriously diminished notwithstanding the construction of accommodation works, such as bridges, at an expense to the railway company of over 3,450*l.* Mr. Percival Fox Tuckett (Tuckett & Son), Mr. Howard Martin (Thurgood & Martin) and Mr. Charles Bidwell (Ely) gave evidence in support of the claimant's case, their estimates of the total compensation payable averaging 2,700*l.*, inclusive of an allowance of 25 per cent. for compulsory sale. On behalf of the railway company, Mr. Edward Boyle, Q.C., submitted that 10 per cent. should be the maximum allowance, and that a sum of about 1,500*l.* would amply compensate the claimant. The principal experts for the railway company were Mr. Daniel Watney (past president of the Surveyors' Institution), Mr. J. H. Oakley (Daniel Smith, Son & Oakley), Mr. Alexander Stenning, Mr. H. R. Goddard (Bedford) and Mr. Lightfoot (Dunlop, Lightfoot & Wallis). The award was reserved.

THE HEIGHT OF GLASGOW BUILDINGS.



AT a meeting of the buildings regulation committee of Glasgow Corporation on the 10th inst., the draft clauses of the proposed new Bill to regulate the height of buildings in Glasgow, which were adopted by the committee, were again under consideration, and several modifications were made with the object of encouraging the formation of broad streets. It was agreed that while 80 feet to the top of the wall head should be the absolute height limit for buildings, in streets under 40 feet in width buildings should not be erected to a greater height than the width of the street, whilst in streets over 40 feet and under 60 feet in width, the height of the buildings might be the height of the street plus 20 per cent. In streets over 60 feet in width buildings might rise to any height up to 80 feet.



BUILDING BY-LAWS IN BIRMINGHAM.

A MATTER of considerable interest to the building public, says a correspondent of the *Birmingham Post*, has been and is now engaging the attention of the Birmingham and other architectural associations. Difficulties having arisen in connection with the administration of the by-laws in some of the local districts, a sub-committee of the Council of the Birmingham Association has been formed to consider complaints and approach the surveyors and district councils responsible for the framing and administration of by-laws with a view to securing more uniform and reasonable action.

The existing by-laws for the city and surrounding districts reveal inconsistencies which would create surprise if they were fully known. As an instance, a set of plans may be deposited

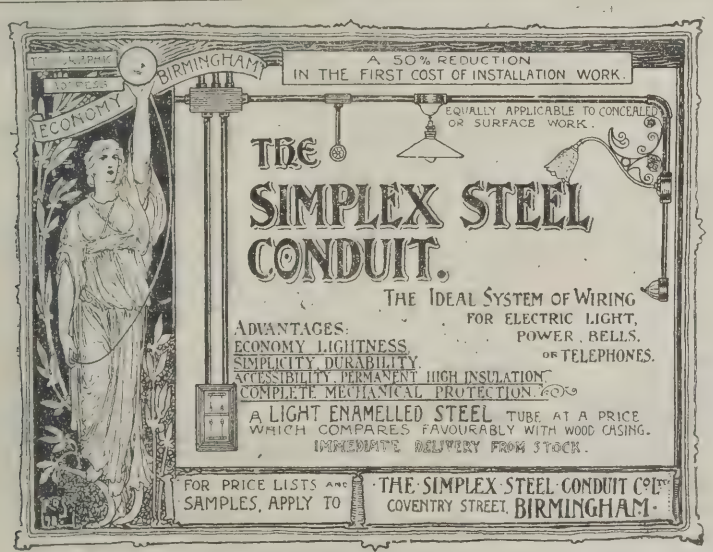
and passed as in accordance with the by-laws of one district which would be returned as quite incompatible with the regulations of an adjoining district, where the conditions under which the work would be done are precisely similar. It should be understood that all by-laws are based upon what are known as the "Model" by-laws issued in 1875 by the Local Government Board, the authorities in the different districts being allowed to make variations in detail from these "Model" laws, and such variations, combined with local regulations under various Public Health and Administration Acts, and probably tinged with the individual opinion of the local surveyor, combine to bring about this confused state of things. In addition it is held that the by-laws and regulations are not properly and equably administered, and that rules and requirements are attempted to be enforced which are not legally valid or necessary to secure either health or safety to individuals or communities. Moreover, in many cases such requirements add unreasonably to the cost of building.

This is an important point in connection with houses for the working classes, because unnecessary outlay forces up the weekly rent which has to be charged to secure a return on the capital expenditure. There is no desire on the part of those whose complaints have been considered to evade any reasonable regulations framed and administered with the intention of securing health and safety. The difficulty, however, lies in the fact that there is no redress, because should a surveyor, supported by his council, attempt to enforce requirements which are practically unnecessary, and for which no legal by-law or regulation is in force, the Local Government Board, to whom such a question has lately been referred, reply that they cannot interfere on questions of administration.



The Architectural Association consider the matter to be one of great and increasing importance, and are anxious to ventilate it before the public whom it so closely concerns, and whose interest it is to see that inconsistencies are abolished and a more uniform state of affairs and administration secured. At a meeting held on the 11th inst. the matter was freely discussed, and an intimation was read from the City Surveyor to the effect that when the proposed revision of the city by-laws was proceeded with the draft would be referred to the Architectural Association for their suggestions. Several letters were also read from the surveyors of local districts which evinced a desire to act in conjunction with the Architectural Association. The committee would welcome any information and suggestions from building proprietors and the public generally.

BIRMINGHAM ASSOCIATION OF MECHANICAL ENGINEERS.

A LARGE number of members of the above Association paid a visit to the Royal Small Arms Factory, Sparkbrook, on the 7th inst. They were received by the superintendent, Colonel Barker, R.A., and Mr. Wiseman, manager. The first place inspected was the stores, where all the finished components of the magazine rifle are stored as they come from the various sections, and are then drawn out to be assembled into the finished arm. From there the party visited the smithery where the stamping or forging of the body, bolt and other components under steam hammers was shown. They then passed into the room where the body was being machined, much interest being taken by the visitors in the many and various intricate operations which this component passes through. The barrel-room was next visited, where the drilling, setting and rifling attracted great attention. The machining of the bolt, magazine and other components was next viewed. The party then proceeded to the assembling-room, where all the parts of the rifle are brought together and fitted. The last room visited was the testing and inspection-room. In this room all components, finished arms, swords, lances, bayonets, &c., are tested in a very rigid and severe manner. Before the party left the superintendent showed some cordite powder and explained the method of loading the cartridge cases. At the conclusion of the visit Mr. J. Cox, the president of the Association, thanked Colonel Barker for his kindness in granting permission to visit the factory, a visit which all had greatly enjoyed. Colonel Barker expressed the pleasure he felt in granting permission and also in meeting the members, and was pleased to hear that they had enjoyed the visit.

EMPLOYMENT OF CONSULTING ENGINEERS BY ARCHITECTS.

AT the meeting of the American Institute of Architects in Washington, Mr. H. G. Bradlee, of Boston, Mass., presented a paper discussing at some length "The General Practice in Regard to the Employment of Electrical, Heating and Sanitary Engineers." After considering the relations of the engineer to the architect, the author referred to the diversity of opinion

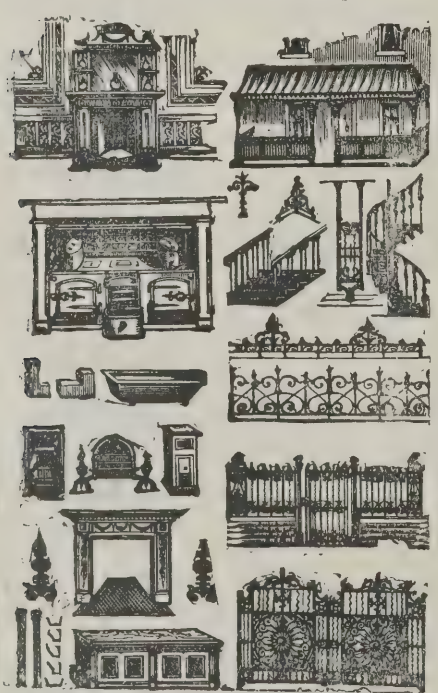
VOLUME LIX. OF THE ARCHITECT.
Handsomely bound in Cloth, Gilt Lettered, price 12s. 6d.
Office: 175 Strand, London, W

that exists upon the question of inspection that comes up when an engineer is engaged for some special branch of building engineering, stating that in some cases the engineer is expected to have a man on the ground the greater part of the time, and in others all that is considered necessary is an occasional inspection to see that the work is going ahead properly. On account of the confusion and misunderstanding that often arises because one set of men are being directed by the engineer and another set by the architect, or by the clerk of the works, the author believed it important that the clerk of the works should have general charge of all of the contractors and of all parts of the work. He should be as well acquainted with the engineer's plans as with the architect's, should see that the work is carried forward in such sequence and at such times that one contractor will not interfere with or delay another unnecessarily. In other words, he should be the engineer's representative at the building as well as the architect's. The author believed that the most satisfactory way of engaging engineers was to obtain those individuals or firms who could take charge of the entire mechanical plant, so that the plans of the electrical, heating and plumbing equipments will harmonise.

In discussing the real value of an engineer's services the author said that in too many cases the engineer's work is considered well done if a plant is installed which operates without giving trouble, and which accomplishes the desired results in the matter of lighting, heating, power, &c. The true value of the engineer lies, it was thought, in accomplishing the results in such a way that the annual operating expenses and the fixed charges on the building equipment will be a minimum. To show the importance of this, the author stated that the yearly operating expenses and fixed charges on the mechanical equipment of a modern building are likely to be from 20 to 40 per cent. of the cost of installing the plant.

In speaking of the remuneration of engineers, the author thought that as the work which the engineer is required to perform in relation to the building equipment is almost exactly the same as that which is expected of the architect in relation to the building itself, the engineer should charge on the same basis as the architect, and should receive not less than 5 per cent. on working cost over 10,000 dols., and should receive a reasonable amount in excess of this on work of less than 10,000 dols. value and upon alterations of old work.



In regard to the amount which the architect should receive on the building equipment and the manner in which he and the engineer should be paid, the author stated that as the engineer should be engaged by the architect, and should be responsible to him in all of the work, he should be paid by the architect, either out of the architect's own commission or out of an additional commission which the architect should receive from the owner. It was then stated that if the architect only received 5 per cent. on the building equipment it would be absurd to expect him to engage an engineer if all of this fee had to be given to him. The author thought that as the architect is held responsible by the owner for the selection of a competent engineer, and in a general way for the work which the engineer designs, as he must furnish the engineer with all necessary information with reference to the details of the building and its requirements, must study the engineer's plans and assure himself that the equipment conforms properly to the building as a whole, and, finally, must make a very large number of changes in the details of the building construction to allow for the proper installation of the flues, pipes, wires and machinery, he should receive an additional amount from the owner to cover the cost of the engineer's services.

The author then called attention to the disinclination of owners to pay 10 per cent. on the cost of the building equipment for professional advice, and he, therefore, made the following comments upon what he thought an owner had to pay if an engineer was not engaged :—

"Without an engineer's services the architect in most cases calls in one or more contractors, explains to them the details of the building and its uses, gives them a general statement of the results which he wishes to accomplish in the matter of lighting, heating, ventilation, &c., and asks them to submit plans and estimates for doing the work. The contractor draws the necessary plans and brief specifications, and hands in a proposal for doing the work in accordance with these. In some cases each contractor draws up his own plans for doing the work, and in others only one set of plans and specifications are prepared, and competitive figures are obtained on these.

"The owner thinks that he has avoided the engineer's commission, but as a matter of fact he is paying for the engineering work as a part of the contract price. This fact is sometimes admitted, but it is claimed that the cost of having the plans drawn up in this way is very much less than it would be if they were prepared by an engineeer, and at first sight this might appear to be the case. The contractor's plans and specifications are usually not as complete as the engineer's, and he is not, of course, expected to make any inspection of the work during construction. The amount of work which he does is

therefore less, and his charge should be decreased in proportion. On looking into the matter more carefully, however, the saving will be found to be largely imaginary. It is true that the contractor does less work than the engineer in planning the equipment for a building, but when this part of the work is placed in contractors' hands it is very often duplicated by having several sets of plans drawn for the same building by different contractors. In this way a large amount of unnecessary work is performed which must be paid for by the owners of the buildings. The contractor must add to each proposal a percentage amount sufficient to cover the average cost of the engineering services. And I am informed by one of the leading steam contractors of Boston that the actual outlay for engineering work in his office, the drawing of plans, specifications, &c., averages each year nearly 5 per cent. on the total of his contract work.

"It is clear, therefore, that the owner is deceiving himself when he attempts to save expense by refusing to have an engineer employed, because whichever way the work is done he must pay practically the same amount for the design of the building equipment. He must either pay 5 per cent. to the architect and approximately 5 per cent. to the contractor, or he must pay 10 per cent. to the architect—5 for his own services and 5 for those of the engineer."

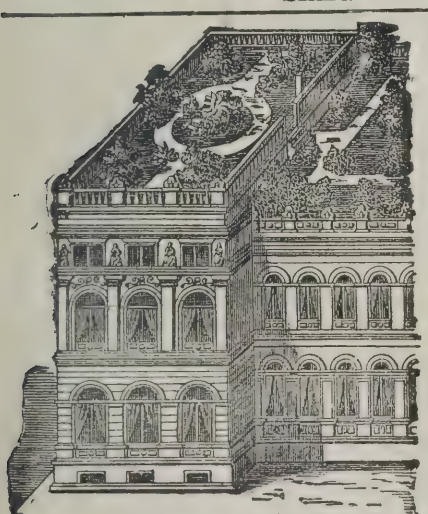
The author believed that the employment of an engineer should be discretionary with the architect, but pointed to the embarrassment an architect might be put to in advising a client to retain the services of an engineer, the client not understanding the situation and thinking that, as he has already agreed to pay the architect a commission for doing the work, in most cases concluding either that the architect is incompetent or that he is trying to shirk a duty which legitimately belongs to him. The client therefore tells the architect that if he needs any assistance on any part of the work he must obtain it, and must pay the cost out of his own commission; or he may tell him that he will engage an engineer, and that as the architect does not consider himself competent to design the engineering equipment, he will, of course, not receive any commission on this part of the work.

The author believes that the situation would be entirely changed if the matter were taken up in a broader and more general manner, and that the architects of the country might issue a statement through the American Institute which would have authority, and which would in a general way define the more important relations of owners, architects and engineers. He suggested changing the schedule of minimum rates of the American Institute of Architects so that the first paragraph should read:—

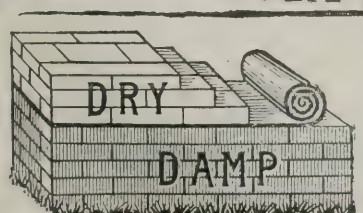
"For full professional services (including supervision), when no additional expert services are required, 5 per cent. on the cost of the work.

"For full professional services (including supervision), when experts or engineers are employed by the architects to design and supervise the installation of certain parts of the work, 5 per cent. on the total cost of the work and an additional charge to cover the cost of the engineer's services."

The author also suggests the form of an additional paragraph with reference to the practice of engaging engineers, and explaining the need of their services, to which a client could be referred by an architect if a misunderstanding as to the architect's position arose.



PROTECTING PILE-HEADS IN DRIVING.



THE following report on pile-rings and method of protecting pile-heads in driving has been prepared by a committee of the American Association of Railway Superintendents of Bridges and Buildings:—

1. We find that the best way to protect the pile-head is to use a 1-inch by 3-inch ring, made out of the best iron that can be obtained at the place where used. We recommend, where a railroad company have a steam-hammer in their shops, that they make their pile-rings out of hammered iron from old car-axles. The cost of a 1-inch by 3-inch 14-inch diameter ring is 1.75 dol., while the same size ring made out of best bar iron costs 2 dols. A pile-ring made out of hammered iron will last to drive 75 oak piles, and at least 300 cedar piles. The rings made out of best bar iron usually last to drive 50 oak piles and 200 cedar piles; in fact, one of your committee had 50 pile-rings made out of old car-axles four years ago, and since that time has driven 250 oak and 6,000 cedar piles without any renewal of pile-rings. A pile-driver should carry on the tool-car 60 pile-rings—10 pile-rings 15-inch, 30 14-inch, 10 13½-inch and 10 13-inch in diameter.

The 14-inch diameter are the ones most used, 14 inches being the width of caps used by most roads. It is not necessary to have the pile-head larger in diameter than the cap is wide.

PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating.

Full particulars, Catalogues, Detail Sketches, Estimates, re Vulcanite Roofing; Samples, Prices, &c. re Sheet Asphalte, free.

THE PATENT VULCANITE ROOFING & ASPHALTE CO., LTD.,
OLD FORD, BOW, LONDON, E.

Inquiries from the North of England, Scotland, and Ireland, please address to Laganvale, Belfast.
Agents wanted in all districts where not yet represented for laying of Vulcanite Roofs and Sale of Sheet Asphalte.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office—175 Strand, London, W.

2. In fitting the pile-ring, the pile should be neatly sawed off square; the pile should be neatly chamfered down at least 5 inches from the end, so the ring will just catch on and let the pile-hammer do the rest. This is a little hard on rings, but in this way you are sure to get a good fit of the ring and the pile-head is best protected.

The face of the pile-hammer should be concaved to the depth of 1½ inch in the centre, and run out to nothing 2 inches from outside of the hammer; this will drive the fibre of the wood down slightly over the edge of the ring and make a neat fit of the hammer, and if the piles are kept exactly under the hammer there is very little danger in fracturing the pile. The best weight of a pile-hammer is 3,300 lbs. The height of the blow should not exceed 12 feet in driving cedar piles, or 20 feet in driving oak piles. It will be found that short quick blows will drive the pile as quickly as long blows, and are less liable to injure the pile. The pile should be neatly prepared before driving it; the knots should be neatly trimmed off, and the pile sharpened to a 4-inch square point for hard driving, the point to be made as near straight with the pile as possible. Piles should never be over-driven. When a pile does not go over 1 inch at a fall of 10 feet with a 3,300-pound hammer, the blow should be shortened to 6 feet, and the pile carefully driven until it stops going or does not go over ¼ of an inch at a blow. The driving of piles for railway traffic, and for all kinds of structures, requires a great amount of judgment to do good work. The use of the iron cap for driving piles in trestles that are in use is not very practicable, as you cannot drive the piles up so close to the stringer with them as you can without them. It is too much extra work to move the stringers so as to use the iron cap and follower, but for driving piles for foundations and dock work, or any place where there is no obstruction, we think Wm. T. Casgrain's patent cap and follower an excellent device. It is especially adapted in driving foundation-piles, as that class of piles are generally short, not over 25 feet in length, and with the patent cap they will not need any toggles to keep them right, and they are good protection to pile-heads, as the piles in foundations should be driven home until they stop and the hammer bounces on them. In driving piles through shell-rock or soapstone or hard-pan, where piles require shoeing, the best way is to use old arch-bar iron, welding four pieces together and drawing the end to a point and flaring the four pieces out to fit the four sides of the pile. Have some holes punched in the strap to fasten the points on the pile with boat spikes; this kind of a point will go through hard substances where the round cast-iron point will not work. These kinds of points have been used by some of your committee to drive through concrete around piers to great advantage, and any one having occasion to drive piles through hard substances too hard for piles should not neglect to shoe them with points made out of old flat iron. A little practice will soon teach one how to make them.

PATENTS.

THE WEEK.

THE late Sir JOHN FOWLER was as typical a Yorkshireman as could be found among the Westminster engineers. Energy, combativeness and common sense were expressed by his features. He had not the refinement of ROBERT STEPHENSON, who was often a very dandified person, the mystery of BRUNEL, or the seriousness of HAWKSHAW, of whom it might be said, as of THURLOW, that nobody looked wiser; but promoters of companies felt that he was capable to hold his own in a parliamentary committee-room with any or all of them. JOHN FOWLER never professed to care much for theory; he was essentially the man of practice who preferred experiments to formula. When he settled down in Queen's Place there was no question of his future. Directors and parliamentary agents believed in him. It was therefore advantageous to become one of his assistants, and a remarkable number of prosperous engineers served under him. It used to be said at one time in Westminster offices that assistants were very glad to work with him gratuitously, the chances awaiting them being sufficient reward. It was also said that as he declined to take pupils but allowed his assistant engineers to do so, a very good income was derived in that way. JOHN FOWLER endeavoured to advance his men, and an humble assistant if he were clever was more prized by him than a swell who was merely ornamental. The late MARR JOHNSTON, who was for a long time his manager, was originally one of his office boys. JOHN FOWLER was always ready to acknowledge without reservation the assistance he received, and his honesty in that respect was deserving of a more general imitation in Westminster. He was connected with such a variety of works he could say without exaggeration "the earth is full of my labours," and he deserved all the honours and rewards he received. He has left very few survivors of the old school that made England supreme in engineering.

AMONG the extra business transacted at the Convention of the American Institute of Architects was the selection of a competitor for the Cornell Travelling Fellowship. The decision of the judges gave the coveted reward to Mr. HERBERT DOLE, engaged in the office of Mr. FLAGG, architect, New York. The subject proposed was, "A Grand Stairway for a Metropolitan Library." The conditions of the fellowship differ from those usually adopted for studentships. The winner will spend the winter and spring studying planning and composition in Cornell University. In June of next year he will depart for Europe and spend four months travelling and sketching in the northern part. On his return he will spend a year in Cornell, where his attention will be concentrated on advanced design. He will next take a second trip to Europe, and will spend four months, if not a longer period, in studying the architecture of the South, and especially in Italy. The conditions are not apparently so agreeable for the student as those followed by English and French students, for the greater part of the period has to be occupied in severe study under the eyes of a professor of architecture. It is, however, possible that more efficient results will be derived from the American system.

THE report of the American Institute of Architects on building laws says that during the past year several changes have been introduced in local building laws, and it is not practicable to prepare the synopsis which was contemplated. In Boston the height of mercantile buildings has been further restricted to 100 feet, in place of 125, and a doubtful innovation has been made in setting the live load to be provided for on school-house floors at 80 lbs. per square foot in place of 150 lbs. As there is a movement in Boston in favour of utilising school houses for public meetings, it is difficult to see why they should not be subjected to the same rules of construction as other public buildings. Many cities and towns have during the year adopted codes on plumbing, and the controversy between the advocates of ventilation and non-ventilation of traps has raged fiercely, the former, apparently, having generally prevailed with the legislative authority. In general, the changes which have been made in building regulations throughout the country tend this year, at last, to favour incombustible materials in all classes of buildings. In Boston, for example, all school houses and all tenement houses and apartment houses of every sort must be of fireproof construction throughout, and there are indications that this example will be widely followed; while the proportion of fireproof private dwellings has increased enormously within the past ten years in the Eastern States. There is reason to believe that this tendency will increase, and it is certain to create a demand for improved and especially cheaper methods of building fireproof floors, roofs and stairs.

THE report of the Birmingham Architectural Association is more encouraging than similar documents. There was an increase of attendance at the meetings, the new rooms are found to be satisfactory, and the influence of the Association has been exerted to secure fair competitions. The Council have determined to abolish the present system of numerous small prizes, and henceforth to offer a travelling studentship prize for the best set of measured drawings, and a design for a subject to be selected by the Council.

As excellent work is performed every year by the Commons Preservation Society, it must be regretted that the organisation did not exist many years ago. Among other matters engaging attention the Society is now advising local authorities and private individuals in upwards of fifty cases of encroachments upon common land, open spaces, roadside wastes and obstructions of rights of way in different parts of the country. Amongst other matters which have occupied the attention of the committee are the excessive removal of turf and loam from Banstead and Walton Commons; the enclosure by the Admiralty of a portion of Hayling Beach Common, Hayling Island; an action which has been recently commenced by the Lord of the Manor of Martin, Hants, against men for shooting on Martin Down, an open space over 900 acres in extent; the illegal action of two district councils in sanctioning the enclosure of roadside waste under their protection; the action of the landowner in obstructing the only access to the well-known Roche Rocks in Cornwall; and questions relating to the preservation of Honor Oak Hill, S.E.; Hungerford Common; Wootton Common, Norfolk; and Holne Common, Dartmoor.

THE address which was delivered by Professor BILES at the opening of the session of the Glasgow University Engineering Society suggests how much success in naval architecture depends on costly experiments. Among other requirements for a designer of war vessels, especially it is necessary to have a tank in which it is possible to test the buoyancy and stability of any vessels which it is proposed to construct. The experimental tank, first made by the elder FROUDE at Torquay, was in practical working order more than twenty-five years ago. During that time a new tank has been made in the vicinity of the Royal Dockyard of Portsmouth, and to this has been transferred the work of the tank which it displaced. During the whole of these twenty-five years this tank has been almost exclusively used for experiments connected with warships. There is one other tank in Scotland—that of Messrs. DENNY, of Dumbarton—which has been in working order for fifteen years or more. It has given to the owners a certainty in the production of predicted results which can scarcely be excelled. Other tanks have been made in different parts of the world, and in all cases they are used for special routine work of ship designing. A tank is almost completed at Washington for the United States Government. This tank is much larger than any previously made, and will be more complete in every kind of apparatus. It will be open, not merely to the designing of navy ships, but to the private shipbuilders of the United States. One of those experimental tanks costs from 15,000*l.* to 25,000*l.*, and the outlay is more than returned in economy of parts and in security.

C

THE CHRONOLOGY OF NOYON CATHEDRAL.

THE difficulty of reconciling entries in chronicles about Mediæval cathedrals and churches with the characteristics of the buildings has been encountered by many archæologists in England as in other countries. In that way the history of architecture often becomes as uncertain as the varieties of political and social history. Efforts are occasionally made to lay down some principles to guide inquiries, but there can be no general rules on the subject. To err is human, and an annalist in one country or at one time may fall into mistakes from which he would be safe under different conditions. The clerics who were charged with the keeping of records were to be excused if they occasionally were negligent in their duty, especially when building operations were to be noticed. On such occasions an abbey, monastery or other religious house would become topsy-turvied. A place of refuge was invaded by workmen who were likely to be irreverent or at least disagreeable visitors. The ordinary routine of daily life to which clergy and monks were habituated, and which was considered as necessary for their souls' welfare, could not be followed out with the old systematic observance while labourers were making noise. No doubt building was admitted to be a necessity, but none the less was it likely to be regarded as an evil which, by disturbing the peace of a community, was not unlikely to be followed by a more lax discipline. For that reason we can understand why, when new works are mentioned, not a word is said which will help inquirers to identify them.

The treatise which, from its interest in explaining the difference between records in stone and those on parchment, may be considered the classic of the subject, relates to Notre-Dame de Noyon, and was prepared for the French Government by M. VITET, the academician. He was one of the organisers of the Commission on Historic Buildings, and in various ways he aided in making his countrymen take an interest in their Mediæval remains. The question arose, Had Mediæval buildings always a right to be considered historical? If so, then the churches would become illustrations of the annals. But was there a correspondence of that kind? QUATREMÈRE DE QUINCY had refused to admit that Gothic possessed any claim to be considered an art; it was merely, he said, a compilation of heterogeneous elements put together by the aid of an ignorant and disorganised fancy, and which was expressive of no other idea than one of disorder. How could work of which the claim to be taken as art was based on false pretences have any historical value? Was it even worth the attention of the chroniclers?

Noyon Cathedral was as good an example as could be found to employ for such a test. It has not the beauty of many others of the French cathedrals, and it was not associated with important events. Then it cannot be considered as pure in style, for it presents many architectural anomalies; in fact, there is much which is puzzling about the building. On that account, however, any reference to it in chronicles or ancient documents would become more valuable.

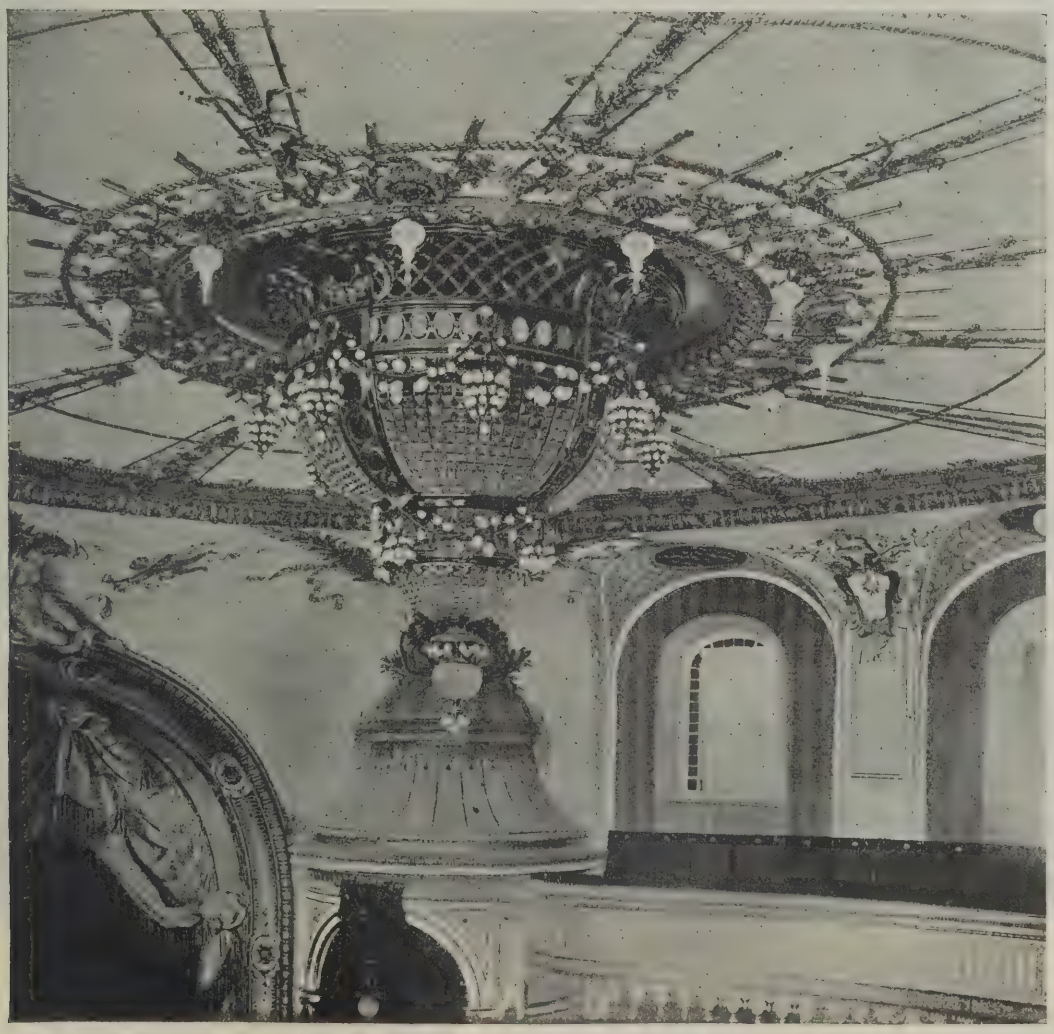
As regards histories few cathedrals could be considered as more fortunate. In 1633 Dean LEVASSEUR published a big quarto of fourteen hundred pages which he derived from manuscripts then existing, and which in other hands would be most precious as evidence. A few years earlier a similar work appeared which, although relating ostensibly to Tournai, treated of Noyon, for the two dioceses were presided over by the same bishop. In the sixteenth century ANTOINE DE MOUCHY also compiled a work on Noyon. Besides these works there exist in the Bibliothèque Nationale many collections relating to the city, and some private libraries possess similar materials. It is, however, a remarkable fact that after toiling patiently and enthusiastically among all the documents he could discover, M. VITET was forced to admit he was unable to add to his knowledge of the building. There was much about elections, congregations, hospitals, privileges, revenues, outbreaks, fires, &c., but from the absence of notes concerning builders' works it might be supposed the cathedral never required an addition or an alteration.

The circumstantial relations which he came across often amazed M. VITET. A little trouble in the cloister, a lawsuit which related to the revenues, an attempt to encroach on the privileges of the Chapter were narrated with as much detail as if the peace of the world depended on them, but about the walls of the old building there was general indifference. M. VITET found it would be infinitely easier to write a history of the city from the time of JULIUS CÆSAR than to ascertain the date of one of the restorations of the cathedral. The manuscripts being worthless as evidence he was compelled to have recourse to Dean LEVASSEUR'S portly volume, which it is to be supposed was based on information derived from manuscripts by writers who cared for building.

As happens elsewhere, the cathedral of Noyon stands on the site of an earlier church, and it may be more than one. In 470 the Huns attacked the district. His church having been destroyed by them, St. MÉDARD, the bishop, withdrew to the Roman *Castrum Noviomense*, and afterwards set up his chair in the town. There is, however, no fragment to be found of so remote a period in the existing cathedral. But Dean LEVASSEUR was convinced that the choir formed part of the saint's cathedral. As to the nave and towers he considered they were erected by CHARLEMAGNE two hundred years afterwards. According to SIGEBERT'S chronicle, the great monarch was crowned at Noyon, and it was to be expected he would be generous to the building where the ceremony took place. This theory was confirmed in LEVASSEUR'S opinion by a picture of assumed antiquity in which CHARLEMAGNE appeared holding in one hand the symbolic globe and in the other a model of the nave and towers. LOUIS XI., when visiting the cathedral in 1468, admired the picture, and asked the Chapter to give him a copy or "un pourtraict de ce pourtraict," which was granted. The Dean could not neglect the tradition that about the year 1000, in Noyon as elsewhere in Europe, much was done to implore mercy by an offering of builders' work to Heaven, but he assumes it was only restoration. He was satisfied the choir was to be credited to St. MÉDARD, as the nave and towers were to CHARLEMAGNE.

M. VITET was unable to understand the want of precision which marked the Dean's historical efforts. He must have had documents relating to the successive bishops of the see, and although the Mediæval scribes were indifferent to building, yet they often mention works in order to enhance the merit of the prelate in whose episcopacy they were undertaken. There were occasional lapses in the annals owing to the fires which arose at Noyon, and for some of which the English armies were responsible; but, after making every allowance, the Dean cannot be held guiltless of inaccuracy and incompleteness.

To a skilled archæologist the least certainty can be turned to account, and as there can be no doubt of the recurrence of fires, M. VITET utilises them in the absence of other evidence. In 1131, for example, Pope INNOCENT II. had arrived in France in order to crown LOUIS VI. The pope and king visited a count who lived near Noyon. Immediately the bishop rushed in announcing the destruction of his cathedral, and implored the pope to obtain aid for him to rebuild it. INNOCENT'S letter to the other bishops of the district is known. All the contemporary chronicles speak of the destruction as an exceptional visitation. It is therefore not going too far to conclude that in 1131 the old cathedral was annihilated, and that no part of the existing building belongs to an earlier period. There were also fires in 1152, 1238 and 1293, but apparently they were less terrible in their effects than that of 1131.



Although there was papal intervention in behalf of Noyon, it does not appear that the rebuilding of the cathedral was commenced immediately. As far as can be ascertained there was no earnest effort made to erect a new church prior to 1148. There is also a record that the altars were confirmed or rededicated in 1158, which would suggest progress with the building about that time which would be sufficient to allow of its use by worshippers. M. VITET concluded that the building could not be considered as complete until about 1228.

If we assume the latter date to be correct, how can we account for the employment of the round arch in the building? The cathedral of Senlis, which was undertaken about the same time, exhibits a fundamental difference, for the pointed arch is used throughout. In the diocese of

Senlis there is another contemporary church, St. Leu d'Esserant, which presents many analogies to Noyon Cathedral; but neither in the nave nor choir is a round arch to be found, one alone exists in the west front. What makes the difference more remarkable is that the cathedral of Noyon in all other respects exhibits the Gothic spirit, and is comparable with the cathedral of Senlis. How is so remarkable a difference to be explained?

In the absence of documentary evidence M. VITET was obliged to seek for a cause in the social conditions of the time. Up to the close of the twelfth century he believed the designing of the churches was entirely in the hands of the clergy and monks. Then came a sort of artistic revolution. Laymen arose who were identified with the new style in which the pointed arch was the characteristic feature. ROBERT DE LUZARCHES, THOMAS DE CORMONT, HUGUES LIBERGIER, ROBERT DE COUCY, PIERRE DE MONTEREAU, JEAN DE CHELLES, ERWIN OF STEINBACH are examples of the masters of works who superseded the clerics. In many places it became a battle between the round arch and the pointed arch; sometimes the newer style was quietly accepted. But in a place like Noyon, where there was a prince-bishop in authority, the new idea could hardly expect to become omnipotent at once. There was a compromise. The round arch was employed, but in such a way as not to appear in opposition or hostility to details which express the new influence. The bishop was one of the great vassals of the crown, and an independent seigneur at the same time; his will would, therefore, be respected by laymen, and he would doubtless make concessions in return. In the plan of the cathedral there is, as M. VITET points out, a mixture of the archaic and the novel which is surprising. Chapels are grouped as in the thirteenth century, but they are semicircular on plan instead of polygonal. Square and circular piers alternate as if combining two styles.

M. VITET, as we have seen, was compelled to depend on the masonry for evidence of the history of the cathedral. We cannot deny its insufficiency. But the question arises whether it is not preferable to be without written chronicles than to possess those which are indefinite or contradictory. By M. VITET's system the history of a cathedral corresponds with geological history. We cannot be precise about years when events took place, but we can determine the succession of phenomena, and in the case of a building the newer parts are not supposed to have preceded the more ancient. It is better to be in that position than to depend on chance references in documents which are so indeterminate as to appear to have been inscribed during sleep by the annalist.

SUNLIGHT MUNICIPAL THEATRE, BROMBERG.

MODERN OPERA HOUSES AND THEATRES.*

IT would be interesting to have the reflections and criticism of so eminent an actress as the late Lady MARTIN upon the immense volumes of Mr. SACHS, or rather upon the system they uphold. That lady could recall the ambition of MACREADY to introduce more artistic spectacular effects than were attempted before he became a lessee of a theatre. But we are disposed to doubt whether she looked back on them with satisfaction. In her provincial journeys she was not exacting about the mounting of the plays in which she appeared, and HELEN FAUCIT might be pardoned if she were confident that she could hold an audience spell-bound in a barn. It would be vain to deny that her performances sometimes suffered from the meanness of the surroundings and the incapacity of the actors and actresses who were supposed to support her. Respect for Miss FAUCIT alone occasionally kept tragedies from becoming farces. One instance is likely to be long

* *Modern Opera Houses and Theatres.* Examples selected from playhouses recently erected in Europe. By Edwin O. Sachs, architect. Volume III., including three supplements, with 20 plates and 860 illustrations. (London: B. T. Batsford.)

notorious, for it was recorded by THOMAS DE QUINCEY. He was not a playgoer, and was easily pleased. He was present in Edinburgh at one of the special performances of the "Antigone" of SOPHOCLES in which Miss FAUCIT appeared. But, unversed as he was in whatever belonged to the stage, he could not fail to notice the mismanagement of the scenery. He also says, "The dress of the chorus was as bad as bad could be, and the corypheus himself seemed no better than a railway labourer, fresh from tunnelling or boring, and wearing a blouse to hide his working dress." DE QUINCEY, strange to say, anticipated the necessity of illuminating effects like those now obtainable in all large theatres as indispensable for the adequate presentation of the ancient Greek tragedies on a modern stage. He wrote :—

The great hindrances to a perfect restoration of a Greek tragedy lie in peculiarities of our theatres that cannot be removed, because bound up with their purposes. I suppose that Salisbury Plain would seem too vast a theatre; but at least a cathedral would be required in dimensions—York Minster or Cologne. Lamplight gives to us some advantages which the ancients had not. But much art would be required to train and organise the lights and the masses of superincumbent gloom, that should be such as to allow no calculation of the dimensions overhead. Aboriginal night should brood over the scene and the sweeping movements of the scenic groups; bodily expression should be given to the obscure feeling of that dark power which moved in ancient tragedy; and we should be made to know why it is that, with the one exception of the "Persæ," founded on the second Persian invasion, in which Æschylus, the author, was personally a combatant, and therefore a contemporary, not one of the thirty-four Greek tragedies surviving but recedes into the dusky shades of the heroic, or even fabulous, times.

Similar effects of light and shade to those desired by DE QUINCEY are realised in continental theatres, and without them some of WAGNER'S operas could not be properly presented. The immense size of the new stages would also be adapted to enable a spectator to realise how far the old Greek tragedies are removed from ordinary life. When, therefore, it is said that the modern spirit tends to nullify the skill shown by players of the old school in simple theatres, it is well to remember that an impressiveness is to be gained which formerly was not possible. Nothing can be entirely perfect, so we must set one advantage against another and make the best of the latest developments.

For in no class of work is construction more influential than in connection with the drama. Pageants and spectacles can now be created and transformed as if by a touch of a magic wand, for the modern PROSPERO in the guise of a stage manager can, while seated in a comfortable arm-chair,

PROSCENIUM, MUNICIPAL THEATRE, BROMBERG.

do what appears to be as difficult as shaking "the strong bas'd promontory" or plucking up pines and cedars by the roots. The new stage machinery does not always, it is true, inspire scenes which impress, although they may surprise, an audience, but so much power, let us hope, will one day enable a dramatist to rise to the height of the Greeks or of the author of "King Lear," and suggest that man with all his weakness is not to be conquered by the elements or by inanimate nature. Because the Elizabethan men were ignorant of stages which were worked by hydraulic or electric machinery, it does not follow that other varieties should never be employed. In a literary sense, it would therefore not be retrograding to ask, with Mr. SACHS, "Why should we not take a leading position in stage equipment, banish the dangerous, unhealthy, unpractical

and expensive wooden stages of 1750, and make room for something far better now that we are approaching the twentieth century?"

We have endeavoured, in our notices of the volumes which have appeared, to suggest the extent of the information which Mr. SACHS has given about the revolution in theatrical construction and stage equipment which is in progress. The third volume presents the subject under a more comprehensive view. It treats of the planning of the various parts of theatres, the provision for service which is needed, the construction of the buildings, lighting, warming, ventilation, water-supply, telegraphy. We have also several copies of the regulations which are in force in various countries to secure the safety of audiences, the shortest of the series being those of Amsterdam.

The latest developments of construction and arrangement have to be mainly exemplified by foreign examples.

EXTERIOR, MUNICIPAL THEATRE, BROMBERG.

But Mr. SACHS suggests that under similar conditions of patronage the English buildings would be no less advanced in all details. According to him "the lower standard of theatre construction in the British Isles, as compared with that of continental countries, must be accounted for to a considerable extent by the conditions of theatrical enterprise and the circumstances under which the drama is presented. . . . It is useless to expect the home of the play to occupy a high position as a public monument in a country where there is scarcely any recognition of the existence of dramatic art by the State, and where its official and pecuniary assistance by the municipal authority is still a question under academic discussion." In a like spirit he writes about municipal theatres. Mr. SACHS does not recommend an immediate application of the rates to support opera and drama, as he says:—"In a country where the most elementary necessities of common welfare, such as the establishment of hospitals, still remain to a very great extent dependent on the voluntary effort and support of individual citizens, would it not seem somewhat anomalous if the whole machinery of the public authority and its funds were at once utilised in the interests of dramatic art, without there at least having first been some serious attempt on the part of those who are desirous of obtaining the patronage and financial support of the official body to organise the institution, and raise the major portion of the funds considered necessary?" These lines will show that Mr. SACHS is no advocate of an indiscriminate adoption of foreign ways.

A theatre supported by the State or the municipality would have, however, one advantage, if no more. It would allow of the production of old dramas which an ordinary lessee of a theatre dare not attempt. The archæology of the drama would in that way be manifested, and the progress of the art would become more clear. Since PHELPS abandoned Sadler's Wells hardly a dozen of SHAKESPEARE'S plays keep a hold on the stage. Anyone who is eager to see more must go to Germany. The works of SHAKESPEARE'S contemporaries are unknown to the ordinary playgoer. The French are less conservative than we are, but the subsidies to the Français and the Odéon enable a student to become acquainted with many pieces which are of importance in the history of literature. We ought to be no less careful to have revealed those plays in which the actors held the mirror up to nature, and which become in consequence historical evidence. If the authorities of towns are desirous to distinguish themselves by showing

respect for the past, they can hardly do better than by aiding in the revelation of the power seen in old dramas—a power which cannot be apparent from reading only. As an example of a municipal theatre we give views of one in Bromberg from Mr. SACHS's book. The building, which was completed in October 1896, cost 23,000*l.*, and has seating capacity for 777 people.

Examples of large and small theatres abound in Mr. SACHS's volumes, for over three hundred sets of plans were placed at his disposal. Moreover, many authorities have given him advice and enabled him to utilise their experience. The work is, therefore, not only more complete than any which preceded it, but is also of a more cosmopolitan character. By placing several plans on a sheet it becomes apparent that the theatre or auditorium in modern times monopolises less of a site than formerly. Approaches, offices, foyers, accommodation for performers now assume an importance which theatre builders of the old school would consider unnecessary. In all such things new ideas have their influence, and Mr. SACHS recognises their importance to the fullest. The very latest arrangements are exemplified.

Then there is the important subject of construction. From the conditions of tenure English theatres were too often made as unsubstantial as if they were to recall the poetic pageants of the "Tempest." There is one example which was, it is said, erected without any view to performances. A site which was supposed to be necessary for the extension of an adjoining structure had to be covered with a building in order to increase its value, and a theatre was selected because it was assumed to be the showiest of all structures, and one which could be erected expeditiously. The scheme did not succeed, but the theatre remains, and people fill it without any misgiving. It must be owned that not the least accident has occurred, and is never likely to arise. We lately came across the following naïve announcement which appeared some ninety years ago:—"In a short time will be published an 'Essay on Theatres, and on the Propriety of Vaulting them with Brick or Stone,' illustrated with a plan and section for a new theatre. The object of this essay is to revive the knowledge exemplified in the construction of the vaults of ancient cathedrals, and to show that a theatre built on similar principles would be of considerable benefit to the proprietor, both in reducing the expense of the erection and the rate of insurance, and at the same time secure the audience against the dreadful hazards to which they are liable from the present mode in which these edifices are built."

He must have been a visionary who could think of the possibility of erecting theatres in the style of cathedrals, but at the beginning of the century that style would impart safety. In our time much can be done without having recourse to vaulting, and the examples in Mr. SACHS's book derive much of their interest from the skill shown in the construction. Not on one ground only are the massive volumes on "Modern Opera Houses and Theatres" to be admired. They are an encyclopædia of the subject from which nothing essential is omitted. Mr. SACHS's task in undertaking the treatise might be called herculean: he has acquitted himself like a strong man and there is no sign of weakness to the close.

EDINBURGH ARCHITECTURAL ASSOCIATION.

THE opening meeting of the Edinburgh Architectural Association for the season was held on the 16th inst. in the Royal Institution. Mr. Thomas Ross, architect, the president, occupied the chair and devoted his presidential address to the subject of "The development of house-planning in Scotland from the fourteenth to the seventeenth centuries." In the course of a few introductory remarks it was shown that previous to the fourteenth century there was little remaining in Scotland to indicate in what kind of houses the people dwelt, the inference to be drawn being that such dwellings were of a slight and fragile kind. But from the fourteenth century onwards there was a vast body of evidence of a most interesting and instructive kind and of an architectural value which had not received the attention it merited. In all parts of the country there were keeps, towers and castles, as they were differently called, which, by their fancifulness of detail, by the excellence of their masonry and ingenuity of construction, excited our admiration, and many of them were duly appreciated by those to whom they belonged. But, on the other hand, it excited one's astonishment to see the indifference with which many a stately tower was regarded and allowed to fall into ruin. The general characteristics of a Scottish keep of the simplest kind, and the various methods to enlarge such a building, were explained by plans. It was shown that the original idea was one room on each floor, so as to leave the tower open on all sides, and that any addition proceeded by way of a single-chambered tower on one side, and the same thing if required on the other side, always so placed as to leave the original tower open and free on some part of its four sides. The singular plan of Borthwick, unique in Scotland, where both the additional towers are on one side, was described. In considerable detail and with the aid of diagrams the gradual growth of the mansion house from the keep was traced, and how the limited space of the latter, which was principally given up to the common hall, failed to satisfy the proprietors during the sixteenth and seventeenth centuries. In this connection Elcho Castle, near Perth, was shown to be a most typical example—a connecting link between the old and the new—absolutely unaltered and in good preservation. Melgund, in Forfarshire, was cited as another instance of such a house. It, at the same time, exhibits a curious harking back to old ideas in having a keep built at one end, so that at first sight it appears to be a building of two periods, while in reality it is all of one period. Drochil Castle, Peeblesshire, which is erroneously supposed never to have been inhabited, was shown to be a most exceptional plan for a Scottish nobleman to adopt for his house at the end of the sixteenth century. Here, perhaps for the first time in Scotland, a complete departure was made from the old style of planning by the introduction of a central corridor, of great width, from end to end of the house, and from which rooms opened on either hand and on every floor. The country, however, was not ripe for such a sweeping change, and probably not till last century was the plan ever repeated. Maclellan's house, Kirkcudbright, and Kelly in Fife were illustrated as most interesting examples of Scottish houses of a moderate size. The remarkable ruin at Barns, near Longniddry, presented a very pointed example of the desire for a more spacious style of house than was common. Built about the same time as Drochil, but never finished, it was strongly fortified, and it had many features in its plan which brought it into touch with modern ideas. The culinary arrangements of these old buildings, as exhibited in the many curious kitchens which still remain, were fully described and illustrated with plans.

HISTORIC SOCIETY OF LANCASHIRE AND CHESHIRE.

AT the second meeting of the session of this Society, Mr. John Hargreaves presided over a good attendance of members and friends. The paper of the evening, on the "Gatehouses and Gateways of Lancashire and Cheshire," was read by Mr. J. A. Waite, who commenced by giving a brief history of gatehouses and gateways from very early right down to the latter part of the seventeenth century, when gatehouses and gateways as a defensive feature ceased to be built. The paper was fully illustrated by a large number of selected views of the gateways of our ancient towns, castles, abbeys, and the gatehouses and gateways of the ancient halls and manor-houses now remaining in the two counties, with a short description of each. The seven chosen examples received a full detailed description of this defensive feature, taken in the following order:—Martholme, near Whalley; Borwick Hall, near Carnforth; Agecroft Hall, near Manchester; and Newbold Hall, near Rochdale, as representing Lancashire; and Brereton Hall, near Sandbach; Ridley Hall, near Peckforton; and Hollingworth Hall, near Staleybridge, as Cheshire examples. At the close a discussion took place, in which Mr. E. W. Cox, Mr. J. Bromley, Mr. W. F. Price and Mr. W. E. Gregson took part, and a vote of thanks proposed by Mr. E. W. Cox and seconded by Mr. J. Bromley was accorded.

HAWICK ARCHÆOLOGICAL SOCIETY.

AT a meeting of this Society on the 15th inst. a motion was passed expressing regret at the loss sustained by Jedburgh through the recent fire, in which the museum was destroyed. A communication from Hawick School Board was received, the Board being desirous of securing the whole of Buccleuch Memorial Buildings, in which the Society's museum is situated, for purposes of secondary education. The Society appointed a committee to confer with a committee of the School Board. Papers were read by Mr. Robert Murray, on "Nanny Cumming"; Mr. John W. Kennedy, on "St. Mary's Steeple"; and Rev. Mr. Johnman, on "Shetland Brochs and the Dwarfie Stone." Mr. Johnman described his recent visit to Orkney and Shetland, with special reference to the brochs, those rugged and robust unhammered rural towers

which claimed to be the patriarchs of native architecture. He specified Clikimin Broch and the Broch of Mousa, both near Lerwick, the latter being probably the most perfect broch in existence. It is situated on the island of Mousa and is 45 feet high, built of dry undressed stone. The circular wall is 15 feet thick and there are three irregular vaulted chambers. Some hold that these brochs, of which there are over 400 in Scotland, are of Scandinavian origin, others date them as far back as the ice age. The Dwarfie Stone of Hoy, referred to by Sir Walter Scott in connection with Norna of the Fitful Head, is a mass of sandstone 30 feet long, 15 broad and 5 feet high. It has been scooped out in the remote past and was supposed to be the residence of a dwarf and his wife. Mr. Kennedy's paper dealt with the popular belief that the steeple of St. Mary's parish church belonged to the burgh. He showed that although the town had repaired the steeple and put in the bell, the steeple belonged to the heritors, and had always been treated as part of the church.

GLASGOW ARCHÆOLOGICAL SOCIETY.

THE annual general meeting of the Glasgow Archæological Society was held on the 17th inst. in the rooms of the Society, 207 Bath Street, Mr. David Murray, LL.D., presiding. Mr. W. G. Black, joint hon. secretary, read the report, which stated that there were twenty-one members admitted during the past year, and that the Council hoped to issue this session the Society's report on the investigations on the line of the Antonine Wall. The financial report showed that the total revenue for the year amounted to 167*l.*, and that the total funds at the credit of the Society now amounted to 730*l.* The reports were adopted. The election of office-bearers then took place, Archbishop Eyre, D.D., LL.D., being elected president of the Society in succession to Dr. Murray. In the absence of the president, Dr. Eyre's introductory address was read by Mr. Dalrymple-Duncan. The subject of the address was, "The Preservation of Scottish Ecclesiastical Monuments." They might well, the Archbishop said, plead for the preservation of the old ecclesiastical monuments remaining in Scotland. Their Society had been established for the encouragement of research into the monuments of the past and of care for their preservation. Members of that and kindred societies were interested in the preservation of such remains, and should look upon themselves as the natural guardians of these treasures. In travelling through the length and breadth of the country they could not fail to meet with much to study and admire in her old ecclesiastical buildings, and not to admire only, but they looked on them as precious relics of the past, and as "special ornaments of the land and glory of the realm." In confining his remarks to the larger churches and ruins still remaining, he said he did so because they formed the only source to which they could look in this country for the improvement of the art of architecture, and as models to copy for Pointed or Gothic work. They had good but simple examples of early work at Jedburgh, Kelso, Dunfermline Leuchars, Kirkwell, St. Andrews, Glasgow, Whithorn, Elgin, Brechin, Dunblane, Dornoch, Holyrood, Arbroath, Dryburgh, Paisley, Dundrennan, Manuel, Kilwinning, Restennet, Crossraguel, Coldingham, Lindores, Fearn, Pluscardine, Cambuskenneth, Deir, Saduel, Ardchattan and Oronsay. He then called special attention to the Scottish ecclesiastical ornaments that remained from the years 1060 to 1560, a period of 500 years, confining himself to the cathedrals, abbeys and priories. The cathedrals of Scotland were thirteen in number, and of these Glasgow and Kirkwall were the only two remaining in a more or less complete condition. Of the other eleven, five were now in use in a modified condition—namely, Brechin, Dornoch, Dunblane, Dunkeld and Lismore. Six were only ruins, though Whithorn was used as a parish church until 1822. They had been ruthlessly dealt with in the past. It was their place and their privilege, however, to protect them from further injury, for they called for their care on account of their archæological interest and the relation they bore to the art and architecture of the nineteenth century; and as a means of stimulating interest in the existing ruins, he suggested that the members of the Society and antiquarians in general should spend their holiday in making a round of the Benedictine houses. A cordial vote of thanks was passed to the Archbishop for his address.

The Competition for the Diamond Jubilee Permanent Memorial, Singapore, has been determined. The following are the awards:—First prize of 200*l.* awarded to Messrs. Francis Sills & W. A. Francken, of Norfolk Street, Strand, London; second prize of 100*l.* awarded to Mr. William A. Tunstall, of Colombo; the plans (design A) of Messrs. Swan & Maclaren, of Singapore, were highly commended, and the plans of Messrs. Sevenoaks & D. G. Lavelle, of Bangalore, India, commended.

TESSERÆ.

Spanish Architecture.

THE epochs of architecture in Spain may be divided into six: Romanesque and Early Gothic, which flourished principally in the northern provinces during the dominion of the Moors, and of which examples are to be seen in the Huelgas cloisters and south porch of cathedral. The florid Gothic, which received much of its inspiration from German sources, and which is rich in fine examples throughout the country, and nowhere perhaps more so than at Burgos, as seen in the Miraflores plates, the spires and Constable's chapel, San Lesmes and others which, though full of blameable features, are remarkable for the band of excellent architectural sculptors who worked them out; and the Renaissance or Plateresque, which partakes more of a Gothic character than its analogous style in France, England and Germany, and is overloaded with ornament, presenting many bad features, yet still exerting the same influence as its predecessors by means of the variety and vigour of its sculpture. Then came the style of Herrera or purified Italian, which answers rather to the modified Grecian style in England of some years back, and is large, massive, bald, totally devoid of ornament, and very uninteresting. Then the Churrigueresque, which may be seen in almost every church in Spain, and is simply abominable. Besides these is the Moorish style, which completely a genus, *per se*, is full of beauties and delight, and deserves the close study of all artists who require grace and ornament and poetic feeling.

Early English Characteristics.

Arches pointed, generally lancet, often richly moulded. Triforium arches and arcades open, with trefoiled heads. Piers slender, composed of a central circular shaft, surrounded by several smaller ones almost or quite detached, generally with horizontal bands. In small buildings the plain multangular and circular pier is used. Capitals concave in outline, moulded or carved with representations of conventional foliage, delicately executed and arranged vertically. The abacus always undercut. Detached shafts often of Purbeck marble. Base, a deep hollow between two rounds. Windows at first long, narrow and deeply splayed internally, the glass being within a few inches of the face of the wall: later in the style, less acute, divided by mullions, enriched with foliated circles in the head, often of three or more lights, the centre light being carried highest. Doorways often deeply recessed and enriched with slender shafts and elaborate mouldings. Shafts detached. Buttress projection about equal to breadth, with but one set off, or without any. Buttresses at angles always in pairs. Fonts of various shapes, often ornamented with foliage in high relief or the tooth ornament, the stem surrounded by detached shafts. Mouldings bold and deeply undercut, consisting chiefly of pointed and filleted bowtells or rounds separated by deep hollows. Great depth of moulded surfaces generally arranged in rectangular planes. Hollows of irregular curves and sometimes filled with the tooth ornament or foliage. Roofs of high pitch, collar-beamed, timbers plain and open. Early in the style, finials plain bunches of leaves; towards the close, beautifully carved finials and crockets were introduced. Carved foliage of conventional character. Flat surfaces often richly diapered. Spires broached.

Architectural Ornament.

To use the same ornament for every variety of building, as is done in Italian architecture, is to play the same accompaniment to every style of music. It is a fallacy to suppose that increase or decrease of size changes the fundamental character. The world is our legitimate storehouse for ornament; but it should be carefully chosen from that animal, flower, leaf or shell which most nearly approaches to the character we wish our building to express, and then even it will be necessary to re-design it so as to suit it exactly to our purpose, not for character of form alone, but for the development of light and shade, as is the principle in Grecian art, and to suit our atmosphere we adopt the principle of Gothic ornament in light and shade.

Figureheads.

The war of the utilitarian spirit against "useless" adornment has never been carried through more thoroughly, or with such complete success, as in the matter of naval decoration. In the first half of the seventeenth century it was considered essential to the prestige of a war-fleet that every ship should have a magnificent figurehead and a poop designed with as much regard to architectural effect as the façade of a prince's mansion. Artists were employed in the great arsenals whose sole occupation was the invention of the most elaborate ornaments, which they carved in massive wood to adorn the great ships, so that they might bear to the remotest lands not only the power of the famous sovereigns in Europe, but something also of their splendour and their pride. These decorations had reached such excesses of extravagance that a reaction against them set in in England, which was immediately followed by the French.

NOTES AND COMMENTS.

The Society of Architects acted in the public interest when a deputation was sent on Tuesday to the Lord Chancellor with a petition praying that a Parliamentary Committee might be appointed to inquire into the present law regarding "ancient lights," with a view to saving the large amount of money expended in determining the rights of owners in respect of such lights. No doubt the present system is advantageous to architects and surveyors, but there are occasions when broader views should be taken. It was explained to Lord Halsbury that the Society desired the appointment of a Building Act tribunal of the London County Council to deal, before the commencement of building operations, with applications made by building owners to define the limits within which they are entitled to build, having regard to the adjacent properties, and of a similar tribunal for other parts of the country. The Lord Chancellor, after discussing the subject, informed the deputation that he would give the matter his careful consideration. The deputation was introduced by the Earl of Hardwicke and comprised the following members:—Mr. Walter Emden (president), Mr. Silvanus Trevail and Lieutenant-Colonel F. S. Leslie, R.E. (vice-presidents), Mr. Ellis Marsland (hon. secretary) and Mr. M. Morse Hewitt.

An interesting competition is about to be held in Paris. The Municipal Council have offered prizes which will be given to the owners and architects of the most attractive houses erected during 1898. As a consequence it is found that unusual care is taken with façades. Carving is largely introduced and in some cases there is an excess of it. Particulars of the buildings which will be submitted in the competition are to be sent in between December 1 and 15. If the municipality can by a moderate outlay on prizes secure originality and beauty in the new buildings few will care to grumble over the expense. The County Council of London and the authorities of provincial towns would be acting wisely if they obtained powers to lay out money on similar rewards.

M. de Morgan, who directed some of the explorations in Egypt undertaken by the French Government, is now engaged on similar work at Susa in Persia. The interest of the place was demonstrated by M. and Mme. Dieulafoy, who were able to discover the remarkable frieze of "The Archers," which is now in the Louvre with other treasures. Apparently at Susa, as at Hissarlik, there are strata which mark the sites of different settlements. It was in an upper level the frieze was found. M. de Morgan's operations have reached a lower stratum, which is supposed to contain the remains of Susa. He has met with a series of galleries that must have formed a part of the citadel, which was the legendary Memnonium. Remains of two large brick edifices were also found, many of the bricks being marked with the names of kings. Among the discoveries were an obelisk bearing an inscription of fifteen lines, fragments of a bronze table and a stile on which a battle scene was represented.

The Workmen's Compensation Act of last year was no doubt passed with the best intentions, but it cannot be said to have improved the relations between employers and employed. It is not therefore to be wondered at if, when a case under the Act is brought into Court, much ingenuity should be exercised to limit the conditions in the interest of the defendant, and to prevent the establishment of a precedent that would be unfavourable to masters. If that may appear too harsh conduct towards a man who met with an accident, it should be remembered that, unless a firm stand is made, the Act would soon become ruinous to employers. On Saturday last a case was heard before the Court of Appeal in which the question to be decided was whether the limit of 30 feet in height for a building as prescribed in the Act was not to be taken as meaning the height when the building was finished. At the time when a brick fell on the plaintiff's head while engaged on a building in the Clerkenwell Road the greatest height reached was 26 feet. His counsel contended that the words of the Act related to the height when the building was complete; for, supposing a building exceeding 30 feet in height was being demolished, would the Act cease to apply the moment the building ceased to be more than 30 feet in height? Their lordships held that the words of the Act could not be plainer, for section 7 said "on, in, or about any building which exceeds 30 feet in height, and is either being constructed or repaired by means of a scaffolding." The Court could not amend the clause by adding "or which may hereafter exceed 30 feet in height." It was therefore decided to dismiss the appeal, which signified judgment in favour of the defendant, Mr. Holloway, builder.

M. Jacobsen, the Danish brewer, has from time to time enriched Copenhagen with works of art. Sculpture appears to be his favourite among the arts, and there could be no objection raised to his competence when he was appointed director of the national sculpture collection. He held office for a year, but that time, brief as it was, was enough to transform the character of the sculpture galleries. M. Jacobsen resolved that casts should be obtained to represent the progress of the art from the time of the Egyptians and Assyrians to the present day. Copenhagen has therefore at present the most comprehensive collection of casts which can be found in Europe, with the exception of those in London, Paris and Berlin. As all the State is able to contribute towards the collection is 165*l.* yearly, without M. Jacobsen's generosity the countrymen of Thorvalsden and Jerichau would be a long time before having the advantage of possessing a comprehensive collection of ancient and modern sculpture.

The people of Liverpool do not seem to be disposed to erect a new cathedral, or to repair St. Peter's parish church, which is used as a pro-cathedral. In the latter an effort was made to make it reasonably secure, but as is not unusual when the work was commenced, it was discovered that what was required would be more costly than had been contemplated. The resources are now exhausted. The bishop, rector and churchwardens say it seems a pity that the work should have to be abandoned for lack of funds and at the risk of having the church closed, now, when not only is the expensive scaffolding in situation, but the contractors have got together an intelligent gang of skilled workmen who thoroughly understand the work. A report has been received from Mr. Shallcross, who attributes the dilapidation to the soft and friable nature of the stone used in building the church, which, moreover, has not been laid on the natural and quarry bed, and in consequence is unable to resist the action of the weather. Another cause is the quantity of iron used for cramps and dowels, which, becoming rusty, cause the stone to burst in many places. According to Mr. Shallcross the octagonal portion of the tower is in so decayed a condition as to constitute a danger to the congregation as well as to the general public in passing near the building, by reason of pieces of stone falling away. Mr. Goldstraw, surveyor to the Corporation, gives the ominous warning that "if the repairs which are now being carried on should be suspended or delayed, there would be a degree of risk to the congregation and the public which ought not to be incurred." The building was completed in 1704, and from its age should have a hold on the citizens. One cause for the apparent indifference is that the site should be used for a new cathedral, and it seems to be waste to expend money on a building which will have to be removed.

III.

Some Cathedrals and Churches of Normandy.

THE cathedral of Coutances, reached from Bayeux by a pleasant railway ride *viâ* St. Lo, is perhaps one of the most beautiful churches of the First Pointed age, the only additions in a later style being the chapels or oratories north and south of the nave aisles, and which, separated from each other by screens having a fenestral form, are pure Middle Pointed. Unfortunately the building is so confined that no good general view can be obtained. It consists of nave with western steeples, aisles and flanking chapels; transepts, central lantern which under certain conditions of light bears a resemblance to the great rood tower at Lincoln, and apsidal choir with double aisles, round which is a fringe of chapels, the lady chapel projecting considerably beyond the rest. Externally the central lantern and western spires form a group which, even in the unfinished state of the centre lantern, forms a group unrivalled on this side of the Alps for gracefulness.

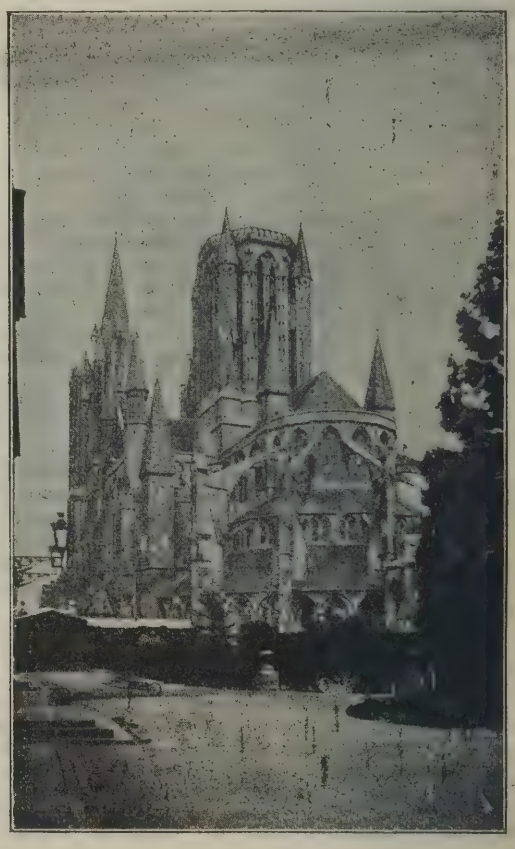
Coutances: St. Pierre and the Cathedral, from the S.E.

A somewhat peculiar and, it must be confessed, awkward appearance is imparted to the western spires by the huge buttresses projecting from the north-west and south-west sides of their towers, which in their upper stage, like the central lantern, are octagonal, with a pinnacled turret joined by a small flying buttress to each semi-cardinal side. A low octagonal pyramidal capping surmounts the great central lantern, of which a fine view, including the transepts and choir, can be had from the episcopal gardens. From each tower projects a deep porch; the northern one is especially fine. In the tympanum of its inner door at the time of our visit were some headless figures which restoration, at that time in progress on this side of the nave, have, it is to be feared, swept away beyond recall, when one remembers how recklessly such works are too often conducted in France. Six bays of traceried windows, the perfection of Early Decorated, and of three compartments, each varying in design, light the nave aisles, to which statues of kings and queens niched in the buttresses give additional richness, as do the traceried parapets, but on the south side of the nave a falling off in elaboration is apparent.

Owing to the almost total absence of colour, especially in the nave, the impression of Coutances Cathedral on entering is cold, but the eye soon learns to dwell contentedly on the grand Doric simplicity of the First Pointed piers and arches. The organ oft, supported on four Corinthian columns coupled, is the first object that attracts attention on descending the several steps leading from the porches to the interior of the church. Unfortunately this piece of furniture conceals the fine inner west door of First Pointed work. The nave piers are all attached; above the arches runs a low arcade composed of five quatrefoiled circlets, forming the balustrade of a triforium gallery; the triforium is closed and takes the form of two arcades under a wide arch equal to the bay below; between the sub-arches is a richly-moulded circlet, and within these sub-arcuations the wall is relieved by two narrow uncusped arcades. The lancet lights composing the clerestory are extremely simple, being without shafts or mouldings, but having in front a low trefoiled arcade on short pillars. Full of study is the moulded string-course, as, indeed, is all the detail here. Looking across the church, in whose vault we desiderate the ridge rib so dear to the English eye—indeed, it is rarely met with in France—most picturesque views are afforded by the side chapels, each separated from the other by a light open traceried screen—an unglazed window in fact. All these chapels are richly arcaded, each having below the traceried screen a constructional reredos of trefoiled arcades. The most easterly chapel on the south has on its east, west and south sides two tiers of figures under canopies; all are much mutilated, but a Crucifixion on the east side has been restored. Many of the reredoses retain traces of colour. The work on the interior of the great tower is most rich. Immediately above the great arches, where it becomes octagonal, occurs a low balustrade (to borrow a non-Gothic word) of trefoils, then a lofty double arcade, of which there is a pair to each of the eight sides; then an elaborately carved string-course; next, another low balustrade; after this a blind arcade, then lofty coupled lancets, and lastly the vaulting. In the choir, owing to the omission of the triforium, the arcade assumes very stilted proportions, the piers in the apse being circular, and placed back to back in couples, giving a very substantial but at the same time élancé character to this part of the cathedral. The chorus cantorum is very spacious, but the fittings do not call for attention, while the high altar and its surroundings are in First Empire taste. The choir has two aisles on either side of it, the outer one being separated from the radiating chapels by a series of arches on short cylindrical piers with foliaged capitals. Above this series of arches is a low triforium of unpierced arcades, surmounted by a clerestory of coupled lancets within a round-headed containing arch.* In the first chapel on the south there is polychromatic ornament, the walls and shafts being painted chocolate brown and vivid green; on the western wall some restored mural painting may be observed. In the second bay of this aisle a door leads out into the narrow lane on the south side of the cathedral, and the ensemble presented to the visitor who enters for the first time by this door is one of great richness and solemnity, owing to the painted

* Such an arrangement of the division between the aisles may be seen on a much more grandiose scale at Bourges and Le Mans.

glass which fills all the windows in this part of the cathedral. All in the chapels is modern and generally good; in the great clerestory windows of the choir and apse, and in the transept triplets, the original glazing remains, remarkable not only as being the earliest specimen of vitreous decoration in Normandy, but for the manner in which the shadows are produced by cross hatching with a brown pigment. Some of the tinctures are truly superb. The windows in the southern range of chapels round the choir are sometimes composed of two lancets and a trefoil, indicating a more advanced form of First Pointed. The second chapel—St. Martha's—has a good stained window not too archaic, as has the next chapel, St. John Baptist's; here both the windows are tripled lancets, the centre light figured, the sides simple patterned. The fifth chapel has a rather too antiquated First Pointed stained window. All these chapels except the first are apsidal. The lady chapel, long and apsidally terminated, is most delicately polychromed, as becomes that dedicated to the Blessed Virgin, cream colour being the prevailing tint of the walls, and light blue of the glass. Nothing worthy of note occurs in the northern chapels of the choir; all have good modern First Pointed glass, of which I especially noted an exquisite diaper in the two-light window of the first chapel in this aisle from the west. The chorus cantorum extends, as at Bayeux, across the lantern. From the nave into



Coutances Cathedral: Nave looking East.

the transepts is a descent of four steps, and one more from the transepts to the choir aisles. The ritual in this cathedral is carried out with much dignity and decorum, and we remember that especially rich crimson copes were worn at the First Vespers of St. James by the officiating clergy.

Besides the cathedral, Coutances contains two large churches, poor architecturally, but not wholly uninteresting. That of St. Nicholas is situated in a small *place* on the east side of the hilly street leading to the cathedral; it is cruciform, with a poor Renaissance central lantern copied, perhaps, from that of the mother church, and a low western pack-saddle roofed belfry which does not reach the apex of the nave roof. Internally this church, which apparently is a seventeenth-century building built in imitation of a thirteenth-century one, greatly surprised us by its extreme length. The choir, a tolerable copy of First Pointed work, has a series of rather wide arches on circular columns of a rich, dark, granite-looking material, with foliaged caps. In the apse are five narrow arches and a low delicate triforium gallery, like that in the cathedral and a First Pointed and very simple clerestory. The lancets in the choir aisles are exaggerated things, something like those produced in churches at home built during the early years of our Queen's reign, but all filled with Renaissance glass. The choir itself, with its grilles and stalls, is most imposing owing to its great length. The nave piers are without caps, the arches dying off into them; above them is a low arcade carried round into the transepts. The high Renaissance western gate to the choir, and the pulpit on two Corinthian columns, with a sounding-board like one of the Wren pulpits, are picturesque instrumenta. Here we noticed pews with doors—a feature once very common in Normandy, but now fast disappearing, we regret to say.

The other church of Coutances—St. Pierre—stands down the hill south of the cathedral, which occupies the highest ground in the centre of the city, and thus forms a conspicuous object for miles round, and even out at sea. This is a really noble specimen of a Late Flamboyant church, merging into Renaissance, cruciform in plan, with a western steeple and bulky octagonal lantern at the crossing. Seen from the railway this church forms with the cathedral an imposing architectural group. Internally it has a lofty arcade of round arches on piers without caps or bases, and an elaborate string-

Coutances Cathedral: East End from Episcopal Gardens.

course below the triforium arcade. The most richly decorated part of the interior is the great central lantern—a really noble specimen of Renaissance work, some of whose details have quite a Romanesque air. It is curious to note here, as at St. Nicholas, how much the cathedral must have influenced the architects of these two churches. Here again were the pews with doors, which, taken in conjunction with the plain round columns, reminded us of a Dutch interior. Some of the windows contain Flamboyant tracery; in others it has entirely disappeared, the broad lancet being divided into two acutely pointed and unfoliated lights, as at Oxford Cathedral before it passed into the hands of Scott for Perpendicularisation. The choir, enclosed by high grilles and a western gate, the former erected on the wainscot, does not extend into the lantern, nor does a lady chapel project from the circumambient aisle. A great deal of Renaissance glass, chiefly modern, fills the choir windows. Before a small statue of St. Anne in the north transept was a galaxy of lights amid flowers in pots, the occasion of our visit

being the festival of that saint. The way in which the organ gallery was suspended at the west end, without any visible support, was noteworthy.

Returning from Coutances to Caen, we journeyed through Lisieux, St. Pierre sur Dives and Argentan to Seez. Many of the village churches passed on either side of the line were, we noticed, equipped with saddleback-roofed towers, and in case of detention or overmuch leisure would doubtless prove of considerable ecclesiological interest.

This peculiar type of steeple seems a favourite one for village churches in that district of Normandy which lies between Lisieux and Cherbourg, but especially in the Cotentin, and it is likewise employed in other parts of the country, notably in the Ile de France and the villages between Etampes and Orleans, but it seems never to have been used on a very large scale in towns. Since the English Gothic revival the "saddleback" has been employed by architects in town churches with much success, as, for instance, by Mr. Butterfield in St. Matthias, Stoke Newington, and Mr. Champneys in St. Luke's, Kentish Town, where it is exhibited, as forming the chancel of those churches, with extremely grand effect. When funds are not forthcoming for a spire, such a termination will frequently be found both economical and effective, and at the same time out of the ordinary.

We were much pleased with the cathedral of the comparatively unknown Norman city of Seez, though not a little chagrined to find the choir and its aisles in process of reconstruction, and for that purpose cut off from the rest of the building, for Seez, while presenting many features of great beauty, has the reputation of being the worst constructed of all the French cathedrals. During the present century vast sums have been expended upon this edifice, which, owing to its defective foundations, has had at different times to be taken down and rebuilt. Hence the far-reaching buttresses of the western steeples, which, taken in conjunction with the disproportionately large but finely detailed portal, impart an air of such peculiarity to this part of the building.

The nave of Seez Cathedral, in the Lancet style of the early part of the thirteenth century, is only one of the many noble works which were rising all over the North of Europe during this Augustan age of her ecclesiastical architecture, an age which, comprised between 1190 and 1250, saw the construction of some of the noblest Gothic buildings the world can show—Amiens, Auxerre, Bayeux, Beauvais, Beverley, Bourges, Châlons-sur-Marne, Chartres, Coutances, Notre-Dame at Dijon, Laon, Le Mans, Lincoln, Lisieux, Loches, Paris, Rheims, Rievaulx, Rouen, Salisbury, Semur, Soissons, Tours, Troyes, Wells, Westminster, Worcester, York—and the great German group so strangely behind the rest of European buildings, yet so worthy of admiration in many respects—Bamberg, Gelnhausen, Herford, Limburg on Lahn, Münster, Naumburg, Neuss, Paderborn and the great Rhenish series. What an age of religious and artistic activity are all these noble buildings, each characteristically beautiful, the evidence!

The transepts and choir of Seez Cathedral are Middle Pointed, and although reconstruction has robbed these portions of a great deal of interest, they abound in exquisite detail, the rose window lighting the principal face of either transept being an unusually graceful example of Geometrical tracery, and there is much that is of great beauty in the inner and outer portals of the north transept. The small doors in the basement of the steeples likewise present much delicate foliaged ornament, as do the caps of the slender shafts in the great western portal—a truly noble specimen of its school, though, as we said above, not well proportioned to the upper stages.

Although the dead wall filling up the eastern arches of the crossing and transept materially impaired the general view of Seez Cathedral internally at the time of our visit, there was much to admire in the portion westward. The nave piers are immense cylindrical ones with finely-foliaged caps, the vaulting shaft being continued right down each, not corbelled off, as in some thirteenth-century examples. Tripled lancets light both aisles and clerestory. Seez being one of the very few French cathedrals in which the old basilican arrangement is retained, the high altar—in Revived Italian—stands under the crossing, being surrounded by a fine marble pavement. The two easternmost bays of the nave are screened off for the "chorus" by a marble balustrade. We could not admire the parcloses—a tall mass of wood painted in imitation of white marble, but enriched in the centre of each compartment by a carved subject within a medallion. The same type of enclosure to the choir exists, though in a richer form, at Chartres.

Seez is a very quiet old place, more like an overgrown village than a cathedral city, but not without its charms, that of solitude and repose being paramount; but, if we except a very rich modern Romanesque chapel attached to the Petit Seminaire, is devoid of architectural interest after the cathedral. A delay of several hours at Dreux, owing to the awkward timing of the trains to Chartres, enabled us to visit its fine chiefly Flamboyant church, and another object of considerable ecclesiological interest—the mortuary chapel of the Orleans family within the precincts of the château, a singular structure in the semblance of a Roman temple erected by Louis Philippe before his elevation to the throne of France in 1830.

It consists of a central round vaulted chamber of Classical architecture, and constituting the original building, but which externally was metamorphosed into a Gothic edifice. From this circular nucleus have sprouted four arms connected together, and with the original Classical shell, by a circular aisle which encompasses the latter. This aisle and its transeptal appendages are both internally and externally in the "Gothic of once upon a time," or that familiarised to us by the illustrations in the romances of the last century. Anomalous though the work be as a whole, there is much internally that is of extreme beauty. The royal tombs exhibit exquisitely sculptured statuary; the painted glass from Sèvres is good, and the place, apart from its artistic character, must always command attention on account of the ill-starred historical associations with which it is invested.

At seven o'clock, after an hour's railway journey from Dreux, the gigantic cathedral of Chartres appeared on the horizon, towering grandly above the city which rises amid the golden cornfields of La Beauce.

(To be continued.)

SOCIETY OF ARCHITECTS.

THE opening meeting of the session of the Society of Architects was held last night, when the president, Mr. Walter Emden, delivered the following address:—

I have to again thank you for having placed me in the presidential chair of your Society for the coming year. I can assure the members of the Society that their Council will give its best attention to the forwarding of the interests and work of the Society.

The work which this Society has always set itself to do is that of being of practical assistance to its members and the profession in general. Any subject which will benefit the profession or the public, and which lies within the scope of the work of a professional Society, will always receive earnest consideration and attention.

Work of the Society.

The way in which this Society has dealt with the question of registration of architects is a proof of its determination to persevere with its work in the face of many difficulties, and I feel sure this Council will not be found less persevering or less ready to labour for the accomplishment of any other of the Society's aims.

During the past year, as was told us in the report, the Society has made some progress with this question of registration, and, indeed, slow as the process of education in this direction may seem, there is no doubt an Act will eventually be passed for the protection of the public by the procuring of properly qualified architects.

Voluntary examination may be all very well in its way, but there should be in all professions where the lives and pockets of the public are so much at its mercy as they are in building operations, no volunteering about the qualification, but an absolute certainty that the qualification has been obtained by the necssary examinations being passed.

The Council has instituted, and trust it will grow during the course of this coming year, a bureau for the employment of clerks, so that those requiring clerks and clerks requiring appointments can have an easy channel of communication, and with the advantage that those requiring appointments by passing through the books of the Society will show that some inquiry as to their capabilities has been made.

It is also proposed (and the last Council has already given a large amount of consideration to the subject) to establish under the Society's control a system of tests. In this presen

age, when invention has been making such vast strides, and every year sees large numbers of improvements and patents of all kinds added to the list, it seems to us a very useful purpose will be served if some thorough and independent tests were from time to time obtainable with regard to their value and serviceability. While it would encourage the inventor, were his invention or were the improvement of proved service, it would at the same time prove a considerable source of benefit to the public by their having confidence in its use.

The great difficulty in dealing with improvements is sifting out the good from the bad, and the usual process through which the public have to go is an extremely expensive one. They have, indeed, to buy their experience. They purchase and use what may and often indeed proves afterwards to have little or no value, and by such expensive experiences are discouraged from taking any further risk, and thus leave much which might in their work or business prove a valuable economy untouched.

Set out in the Society's Journal of September are some of the ways in which such a system of tests could be of service to the public, to the professional man and to the inventor.

The tests, however, would not be limited to new inventions. There are constantly new materials coming into the market which have their special attractions in price or manufacture, and which at the same time, being untried, want of experience prevents being freely used.

Rights of Light and Air.

Another practical work, and that of the first importance, which is being undertaken by the Society is that of bringing about some change in the law which, without affecting the rights of property, shall prevent the vast waste of time and money which there is every year in negotiating and litigating over questions of light and air.

Every architect and surveyor knows well the annoyance which his client and he also is put to when proposing to erect buildings in any town. It is no exaggeration to say that in some cases a building which may greatly improve the surrounding property by its being erected is attacked on all sides by questions of light and air, and that a crop of ten or a dozen cases may be raised against it, often many of them of the most trivial nature, and it must be an especially lucky building owner who commences and completes his building without any such claim being made.

Almost all of these cases arise from the uncertainty as to what does or does not really affect the rights of an adjoining owner, and what can legally be held to materially affect it, and beyond this I am afraid it is only truth to say that the desire of gain largely affects the claims made. Not only professional costs, but the larger gains contained in the question of whether, rather than have his building stayed by an injunction and risk the large amounts necessary to fight an action on nothing more than trivial rights or even imaginary ones, the building owner will not pay a sum of money or blackmail.

If we look for an instant at what has to be faced by a building owner, it will be seen at once that it must often enough curtail building enterprise, as does the state of uncertainty seriously impede those who legitimately wish to rebuild or improve their premises.

Everyone seems to think that a building owner is fair game for compensation.

It is only natural that each surveyor should desire to look first at his client's interest and desire to do well for him, and necessarily in dealing with the business in hand they do not trust the other side to look after their clients, and the state of uncertainty as to what are or what are not a client's exact right under the law as it stands all tend to prevent a settlement and produce a lawsuit.

The same affects the solicitors when they come on the scene, and consequently not only do the professional costs get piled up by the law's uncertainty, and one man will get through where another is stopped, but a lawsuit becomes almost inevitable.

In order therefore to protect the interests of a client an injunction is obtained, and I fail to see that the architect or solicitors can be blamed if in their client's interests they obtain an injunction where the case may be of a trivial character if they think their client is likely to obtain a monetary benefit by so doing, which may even be larger than the real value of the damage.

These cases, too, depend so much on technicalities, while the necessity to bring home to judge and jury the facts as they are is so great that models and numberless plans have to be prepared, and experts at expensive rates called in order to prove fully the views of each side to those who have to try and decide the case.

What wonder is it, then, that these cases become enormously expensive, and thousands of pounds are every year more or less wasted in costs on them? This very expense is the opportunity of the man with rights great or small to obtain from the building owner a sum of money—rightly or as a blackmail matters not—it is paid: as at all events it leaves the building owner better off than to try the case with its attendant risks and costs.

I venture to think that no inquiry into this subject could be made without disclosing not only the great number of these actions, but their wasteful cost.

I am sure, in the eyes of every honourable professional man, it is necessary to avoid this useless waste of money, and he would desire to prevent the class of case being set up which so often assumes the aspect of blackmail.

The Council of this Society has set itself to work to make a determined effort in the direction of preventing this useless waste, which affects not only the public, but the honour of professional men.

There is no doubt the question is a difficult one to deal with when first approached, because it is not desirable that people's vested interests and rights of property should be interfered with; but it seems to me that the object which we have in view can be obtained without any such interference, and yet justly and effectively prevent the waste which has been and is a growing evil in England.

In Scotland the Court of the Dean of Guilds deals with these questions, and the canny Scot is saved the annoyance and expense; and conservative as we may be in England, there can surely be no reason why we should not adopt some similar or suitable means to accomplish the same end here. The Building Act tribunal, in dealing with Building Act cases in London, has shown that there can be no difficulty in appointing a technical court to deal with these matters; and the payment of its cost would be the merest fraction of the costs to which building owners are now put.

The secret of this wasteful and improper system lies, like all other wasteful systems, in the uncertainty of the extent and value of the rights affected, and until these can be decided before commencing to build by an independent decision from a court to which it is compulsory to go as in Scotland instead of stopping the building in the middle, the waste and impropriety of the present system will grow and scandalise our ability as businesslike and honourable men.

The suggestion which I would make, and which I think this Society should adopt, is that a technical court under the London County Council in London should be established, and every building owner should be compelled to deposit a full set of the plans of any new building or material alteration of a building with the central authority paying some such fee to cover the expense of dealing with them as may be deemed necessary, and that the authority, should then require the owner to give notice to all the adjoining owners who may be affected, so that if after examining the plans they think there is interference with their rights of light and air or other easements, then the tribunal, after seeing that all interested had had notice, should proceed to hear the objectors and the building owner, and, after hearing, decide as to what height, &c., the building can be carried without interference with the lights and easements of the objectors.

The fact that such a decision is given before building operations are commenced, and before the building owner is pledged to his contract with his builder, would of itself be a substantial boon, apart from the great saving of time and money, and apart also from the saving made by its being an absolute preventive of blackmailing by factious and petty cases being raised and the fighting of expensive actions.

I fail to see that anyone could suffer injury by this course, and the good arising from it must undoubtedly prove a valuable incentive to the public and professional men alike in the numerous building operations which in this great city are constantly necessary.

There is no doubt that, when cases are carried on, men's feelings and men's judgments get involved and warped, and cases are carried in consequence to such lengths that thousands are spent on small and petty matters, which in themselves, taken at the very largest valuation, would not represent more than a very small portion of the costs which are incurred.

I in no way wish to pledge myself or the Society to the details or the exact methods by which this beneficial change should be brought about, but I suggest what must appeal to all as advisable, and simple means, such as an extension of the powers of the Building Act tribunal in London, by which to accomplish it. The fees charged could be made to cover all the expense of the court and its attendant officers, and would then be moderate enough to prove a mere drop in the ocean compared to the present wasteful process. Future discussion on this subject may devise better means, but any way it is in my opinion, and I trust it is the opinion of all those to whom I speak, necessary that the settlement of this subject should not be longer delayed and that the remedy should be applied at an early date.

The Society have presented a petition to the Lord Chancellor, and I have also laid before the London County Council a notice of motion for the Building Act committee to consider

this important question, and I hope for the hearty and substantial support of the whole of the Society.

The only difficulty is that the question does not appeal directly to the great body of the public, who, though they may suffer in certain ways, only suffer occasionally and for the most part indirectly; but those who build and have built will I am sure feel the force and necessity for the remedy which we advocate, and I trust they will use also their endeavours to bring it about.

I trust, too, that the efforts of leading men in the professions of both architect and surveyor, as well as those of the legal profession, will not be wanting in the necessary effort to bring about a reform so greatly needed and which will once and for all sweep on one side the exaggeration of claims of a petty and improper character, with all the attendant waste of clients' money which comes in its train.

The Local Authorities.

I would like to say a word or two on this subject, more particularly as applied to London. There is in London much overlapping of authorities, and a multiplication of applications totally unnecessary for the protection of the public, and indeed tending rather to befog it and to leave loopholes.

A valuable reform might be made in this direction, and perhaps when we have the new Municipalities Bill of the Government this might find a place.

A simple reform could be made by extending in the Council's hands their powers as a court of appeal, with power also for the making of rules and regulations, but place entirely (except as to the necessary inspecting officers to check the local authority) the administration of such rules and regulations and the passing of plans in the hands of the district or local authorities. Let the district surveyor also be the surveyor of the local authority: let there be but one surveyor, with a competent staff in each division of the county of London, and only one administrative authority, the local or divisional one, to pass the plans of buildings, both as to structure and sanitation, and indeed for all purposes.

Appeals from the decisions of the local authority could then well and properly lie with the London County Council as the central and head authority. Now, not only have plans to be passed through several authorities, but there is the absurdity of the London County Council having appeals against itself, a course which, in my opinion, good as has undoubtedly been its work, is calculated in the long run to lower its authority and prevent that public confidence which there should be in its decisions.

The State of Sanitary Work.

There is another subject, vast in its proportions and far-reaching in its effects upon the health of the public, which requires urgent attention.

No one can fail to know that in the smaller towns and in the provinces very little inspection goes on, and houses are drained and allowed to keep or use appliances of a most dangerous class—a fact which not only keeps up but spreads disease to an extent which many will hardly believe. Every year brings its crop of cases of typhoid and other diseases caught in country houses and country towns of the smaller class.

The remedy lies in the law enforcing a strict uniformity of requirements adapted to town and country buildings, with a regular and full inspection and with power to enforce requirements.

We are told to leave the town and go to the country for health, but I venture to say that the health statistics will show London and other large cities, taken as a whole, have a less death rate than many a country town and many a country district.

It cannot be said the large towns are perfect; indeed, they are far from it, and must so continue while the apparatus and system approved in one district are disapproved in the next (merely across the road), and while this uncertainty and confusion exist this imperfect state will not decrease but will probably increase.

The remedy is simple: let the battle of systems be fought out before some competent and independent authority appointed by the Local Government Board, and then let us have uniformity.

There is no reason by so doing to discourage improvement but rather to encourage it, as the same authority could and, in my opinion, should have power to examine at the instance of any sanitary authority any suggested improvement and to certify it as suitable for use.

Of course, the system for London, or in large towns, cannot be the same as for a country district; but there are equally good systems of drainage for country houses as for London houses; all that is necessary is that their use shall be defined and enforced.

We cannot but hope that this important question will not be left until some terrible epidemic brings it home to those who at present neglect and sleep over it.

London Improvements.

There is still one subject more I would like to call attention to; it has been claiming some attention lately, and is of serious importance to the good working of this vast city.

Sir J. Wolfe Barry, in his address to the Society of Arts, suggested great improvements in the thoroughfares of London. I do not question the need for the great and growing necessity for widening main thoroughfares, but I fear that, before the authorities have the courage or possibly the inclination to spend such vast sums as the proposals he makes will cost, the necessity will become unbearable. No doubt, with our present knowledge, we could lay out a city on much better lines than those on which London at present exists (though there is much to be said for the picturesque and quaint appearance of many of our streets), but it is and would be too costly to try the means suggested, and the disturbance of trade centres and existing business premises would affect in a very detrimental manner the occupiers and the ratability of the district through which the improvements were carried.

It seems, therefore, that we must meet the growing want and present pressure by some less costly method. No doubt we must press on the widening of some of the various great thoroughfares where feasible; no one will suggest that, where the cost is such as the community can reasonably bear, there should not be further and well considered improvements, but it is clear these will not meet the pressure. The increasing traffic caused by those who work in and whose business brings them in increasing thousands to this great city must be met, and we must therefore examine into other means for meeting the difficulty within the power of the ratepayers' pockets.

It is no doubt a fair question to ask: "Are we, because great new streets are too costly, to sit still?"

It is some years since I first suggested subways for London to prevent the great inconvenience to traffic and business by the constant upheaval of the road surface for the laying and repairing of pipes, wires and drains.

My suggestion went so far as to propose that the whole width of the roadway should be a subway, which could be well used for and would amply accommodate not only all the pipes and wires, but would also leave good broad ways for pedestrians and, if it should be necessary, for bicyclists too.

The advantage of subways in saving the road surface is great. The benefit to companies for water, gas or electricity, in the facility for examining, testing and attending to their pipes and wires, must be evident, and would, in my opinion, prove such a saving as to make the rent to the authorities well worth paying. Thus not only could a very much increased traffic be covered by the same roadway, with its subway under, but an outlay of much less capital would be required, with considerable prospect of some return by rents. There would be much less disturbance to business; there would be no goodwills of business, or leaseholders' or freeholders' interests to pay for indeed, the land would be obtained without cost, while the cost of the subways being almost entirely that of building, the expenditure would give employment to the great numbers of workers who live in this city, and who spend their earnings in it, and thus those who had to find the cost would obtain some return benefit from its expenditure. I must conclude, however, and content myself with what has been already said, in the hope that some of these great and pressing questions of reform which are before us may commend themselves to those whose duty it is to take note of public opinion and public necessities.

ARTS AND CRAFTS.*

(*Concluded from last week.*)

THE key to human development is found in evolution, and the key to architecture also is found in the gradual evolution from arts and crafts unconsciously. It is the unconsciously produced record of mental development. It is a kind of spiritual skeleton. A cathedral with its innumerable cells and vaults, its pillars, spires and pinnacles bears the same relation to the complex organism which produced it that a sponge bears to its secreting cause. It, like the sponge, is the symbol, the formula, the evidence of vanished life. Our judgment, therefore, of the cathedral as a thing in itself, merely as the production of the conscious art of one man, is as valueless as a criticism of a sponge would be, made by a man who had never seen the living animal.

Just as the sponge is built up under the stimulus of the life of it by the labours of countless silica secreting cells—each cell the descendant of a long line—so the cathedral is made by a number of stone-laying organisms under the stimulus of the collective life, religion, enthusiasm, ordered by the directing mind of the master, who is himself but the servant of a greater

* A paper read at the last meeting of the Architectural Association by Mr. H. Wilson.

power. All the separately-acquired skill, all the individual art and craft, all the personal life of each individual is fused into the general mass, and is there given new importance by sharing in that mass. The building is enriched by the work of the individual item, and that work is in turn ennobled by being part of the building. The harmonious aggregate of the personal arts becomes the impersonal, the human, the racial art of architecture. What is true of the great things is true also of the lesser. The lower order of buildings, to use the common distinction, were produced by humbler organisations, and because they were the simple direct and logical outcome of special social needs, were beautiful in structure with the beauty that one feels in a leaf, a plant, a shell. The work was beautiful not so much because beauty was sought, but because the work was the natural expression of the lives of men in harmony with their surroundings. Its value to us is in the unconscious evidence it gives of the minds of those who produced it. For what is most precious in our own work is not what we consciously seek for, nor what it is our will to express, but what we unconsciously reveal of ourselves, our race, our society, our condition.

Now it must be evident that if architecture is thus a natural, social, racial art, if it be produced not by the will of single individuals, but is the expression in masonry of the working of time-spirit, then it must be clear that what we are doing to-day cannot be called architecture simply because what passes for such is produced under quite different and quite artificial conditions. It may be interesting—to the sociologist; it may at times be beautiful; it is not, properly speaking, architecture. Modern building, when it is beautiful, s always the work of artists who by hazard have made bricks and mortar their medium of expression. They would have done notable work in any material; but, in judging of the building of a nation, we must take the mass of it, and not the sporadic works of men who were artists first and builders afterwards. Judged by the mass of brick and mortar raised to-day, there is little to be proud of in the art that produces such works as—any building each of you particularly dislike.

This brings us down to our own day. The fact is that Renaissance is notable presumably for architect's architecture. It is the work of architects who design as distinguished from those who did not. But though it and the architecture of design was so produced, the men who did it were real craftsmen in the completed sense of the word. Look through any biography of the Mediæval masters and you will find that they were almost without exception trained first as goldsmiths, painters, sculptors, workers in wood, ivory and mosaic. They were employed chiefly as designers, architects when they had attained eminence in the crafts. The hard training of work in material had filled them with ideas and enlarged and rounded their ideals. Having mastered one or more arts before they touched design as a separate thing, their work had a sculptural completeness impossible of attainment in any other way. But we must not forget that much, if not all, of this completeness came from the unifying labours of the creative craftsmen associated in the guilds, then in the very height of their power. Though the skeleton designs were prepared by the master sculptor, and the proportion settled before the building was begun, the designs were overgrown, veiled and clothed by the individual creation of the special workman to whom each portion of the building was assigned. Those workmen trained under and elected into the guilds put into their work unhindered, though directed by the designer, all that their skill enabled them to express of ideas and the tradition of their guild, and for many years we do not perceive the necessarily mechanical methods to which the designer, considered as the user of a separate faculty, was necessarily reduced.

But these mechanical or scientific methods are there, becoming more and more evident as time goes on until the building is turned into a mere sitting for a variety of the delicate and beautiful works of men who, without ceasing to be artists, are daily less associated in the vital design of the building. Their work ceases to have those organic relations to the whole which we find even in eighteenth-century buildings in England. The art of design is in the process of evolution into artifice; the designer becomes more and more specialised into a constructing draughtsman, the maker of graphic specifications for buildings instead of the actual maker of buildings. Little by little he loses hold of the guilds, and then makes the artists become specialists each in his own department; the guilds dissolve, and as the importance of the design increases their powers decrease, and that great tide of life, of whose existence they were the evidence, finally ebbs away, leaving as the last product of the Renaissance—the final flower of all that cultivation—the modern architect, high and dry as the arid peaks of individual effort, cut off from any possibility of doing as he might wish, condemned to more than Sisyphean labour of producing something out of nothing, while deprived of means to do it. That is the position in which we found ourselves but a little while ago.

It is manifestly illogical to blame the architect for being the result of a perfectly natural process of evolution; it is equally illogical to expect from a man the work of a multitude, or to get from a molecule the momentum of a mass.

It is all very well to show why a thing is wrong, but it is important for us to know what we ourselves are to do—and this, though difficult, is not impossible. In the first place, as architecture is built up by the harmonious co-operation of the natural aptitudes of many individuals, it is necessary for each to follow his own particular bent and to devote himself to that work to which he feels most drawn, and in the vast field of building there is ample room for the effective working of every talent and the display of every power. And, inasmuch as all the crafts are necessary to architecture, there need be no strife for precedence, for we all, as in life, are interdependent. Just as there are diversities of gifts but the same spirit, so there are diversities of crafts with the same art working in all, embracing all, inspiring all. The lead worker who does a fine font, the silversmith who creates a chalice, the modeller, the plasterer, the mason, the waller and the sculptor, the carpenter, the joiner and the carver are all necessary and all equal in so far as each does the work to the best of his ability. There is neither greater nor less in the kingdom of art—all are the servants of their own souls, as they are the servants of God—and that is the art of the whole matter.

I do not mean by suggesting that each man should take up a craft, to advise the dilettanteism which dallies for an hour or two in the evening over some easy bit of work, done at a loose end, without reference to any actual building, although even that is not to be despised if it leads to a truer perception of the nature of building. I mean this, that each should determine to be—as the old men were—a craftsman first and an architect afterwards, for it is futile to talk of directing the handicrafts if we are not in some degree craftsmen ourselves.

Moreover, the value of the craft study lies not alone in the manual and mental training we derive from it, but in this, that the very processes of work suggest other designs, the original pencil sketch is modified or abandoned as the thing we make takes form. When we have done the work and placed it in some corner of the studio, the actual faculty which was held somewhat in abeyance by the ardour of work reasserts itself, we see defects of design and remedy them. As the light fades or changes the work takes on new aspects, and becomes the starting-point of an entirely new and living set of ideas. It is a source of fruitful suggestion while it remains there, whereas when the original sketch, drawing or design has been handed to a tradesman, not only do we lose the full power of modifying work in progress, not only do we lose the suggestiveness of process, but the work when done is neither our own nor the workman's; it is an illegitimate birth, and bears the marks of it on its face for all who have eyes to see. What is true of the lesser art is true of the greater; unless you live with your buildings, unless your craftsman's knowledge is hourly used to support up your artistic inspiration and organise the work of other craftsmen associated with you, not all the drawings in the world will produce a building fit to be called a piece of architecture. And that, in spite of the hopeful enthusiasm and the passionate earnestness which characterises the rising generation. Now, having tried to tell you what might be our aim, let us consider how our object is to be accomplished.

This, again, though difficult, is not altogether impossible; we must first consider what our actual position is to-day; we, as the descendants, in point of time, from the scholar architects of the Renaissance, find ourselves in an age in which labour is organised, not to produce the finest kind of work, but to regulate the hours of labour and the rate of wages. The trades' unions take the place of the guild. Separated thus from the very means by which fine building was done, architects are themselves organised into a profession, and, instead of being actually concerned in the work of building, produce briefs and diagrams from which erections are raised. Almost from necessity the methods of the counting-house have to be employed in the simulation of art. The man whose energy and intellectual labour supplies the directing power and lays down the lines of work is, also from necessity, very rarely present while that work is carried on. The specification, the contract drawings and details are the modern substitute for co-operative design carried out under the eye of the master builder. How to begin to evolve living art out of this muddle of dead systems seems almost hopeless, but I believe that a beginning—and that a very hopeful one—has already been made. This beginning is to be seen in the revival of interest in individual craftsmanship, and in the result of that revival, the School of Art and Handicraft in Regent Street, which you all know so well. I see beginnings of better things in the increasing numbers of men who are forsaking the easel for the furnace, the drawing-board for the banker, the office stool for the forge and the workshop. For many, perhaps most, architects this is impossible, but it is possible for everybody to co-operate with the men who are trying to improve the standard of work by doing work themselves.

This co-operation might take many forms. The decorative

work required in any building, instead of being handed over to the commercial firms, might be entrusted to the various men now working who have made those crafts their own. The design would naturally be left to the craftsman, after the general scheme of the building had been explained. The amount of work which the architect would be spared is incalculable, and his building would gain in distinction.

The droves of young sculptors who now haunt the studios in search of work might win their spurs in architectural sculpture, which is practically a lost art; while the still more numerous painters might be given commissions for wall decoration, instead of handing that work over to the wealthy and overbusy firms. And so on, round the whole crafts. In a very short time we shall have a large number of craftsmen who will be fit to erect buildings by themselves, without the aid of the professional architect. With a little judicious training and reining in, we should at least get interesting work to look at.

This, however, does not by any means exhaust the ways in which the new architecture might develop. Those who do not feel called to the crafts could take up the engineering side of building—for the vast work of providing for our daily extending commerce must obviously go on. The necessity for careful, honest engineering work, the still greater need for efficient and continual supervision, seems to me to offer numberless opportunities of congenial and remunerative work to capable men; and then work, the less acknowledged as when well and simply done, is just as valuable to society as the beautiful craftsmanship which appeals to every passer-by. We cannot all be craftsmen, but there is room for all if we only make room for ourselves.

I think, moreover, that those architects who are favoured by fortune with a plenitude of building work have it in their power to create almost at once a school of associated craftsmen, who might do for the buildings of to-day what the associated craftsmen of North Italy, led by such men as Orcagna, Niccola Pisano, Lorenzo Maetani, Mino da Fiesole did for the buildings of their day. All the elements are here. When we have sculptors like Alfred Gilbert, Thornycroft Bates, Stirling Lee, painters galore, metalworkers like Alexander Fisher, Nelson Dawson, their pupils and followers, what more could we desire? Our happiness is always next door, awaiting us. There is no need to search the world for it, and it is the true happiness in which lies the full activity of every faculty in the opportunity of the complete and rounded development of the whole man. But it is essential that our architects should abate somewhat of the professional dignity which encloses them and give the craftsmen freer play; then in time we may see a new Architectural Association on the ruins of the old, but it will only be done when we have for ever got rid of the architect.

Lieutenant-Colonel Prendergast, who proposed a vote of thanks, thought that the idea of the transposition of the workman into the position occupied by the architect was ridiculous. The workman, as known to us, was unable to take up that position in work where unity of design was required. The trades unions had in some measure taken the place of the ancient guilds, but even these unions could not agree among themselves. Thus it was important and necessary to have a directing mind when building.

Mr. Halsey Ricardo, who seconded the vote, said there were greater facilities now in the way of building materials than there were fifty years ago, but still the work of to-day showed a disregard of those facilities. The Romans had unintelligent slave labour, and they made them break stones and mix ingredients. We could now do the same as they did with machines. How useful concrete would have been to the Romans. The introduction of steel, too, was important, although we made little use of it. But how the Romans would have danced with rage if they had known of its usefulness, and yet had to construct without it. Insincerity showed want of life, but all the conveniences and facilities at the command of the builder of to-day should certainly make our work sincere.

Mr. C. Whall thought the paper too deep for audible delivery. He said that at the bottom of all these art controversies there arose the question, Were they to be men or machines? He thought they would become craftsmen and not machines if encouragement was given to the movement which was on foot to establish the crafts among us. Technical education was engaging the London County Council, and the effort to promote it was received in the most earnest and enthusiastic spirit. The results as yet were a great comedown from the work of the Middle Ages, but there was hope that it might grow and perhaps in time become a rival.

Mr. H. T. Hare pleaded that an architect's life was too short to enable him thoroughly to master all the various arts and crafts allied to architecture. A general knowledge was all he could hope to attain, and sometimes it was only a superficial knowledge. A body of craftsmen could not take the place of the architect; a guiding and master mind was necessary to carry out the arrangement of the building. If left in the hands of craftsmen each man would be likely to strive to secure his own way without proper subordination to the others.

Mr. Thomas Blashill said he was a little surprised at the line the lecture had taken. He came to hear something outside his own profession, but in the latter part of the paper it unexpectedly drifted into architecture, which was another thing, and did not properly come within the title of the lecture. They had heard such views for over forty years in London lecture-rooms, and they had become hardened and deaf to the cry by this time. Such views showed a tone of dissatisfaction with everything that was done, and he hoped few would be affected by it. It was not a hopeful road to advocate trades, and if they were to follow such advice and sacrifice their careers by taking up a trade they would be just as dissatisfied with everybody and everything. He thought a man was just as likely to succeed as an architect as an artist or sculptor might succeed in his profession.

Mr. D. J. Fyfe and Mr. H. B. Cresswell supported the vote, which, being put by the chairman, was carried unanimously.

Mr. Wilson replied, and said it was his aim to explain what was his own ideal. He had no wish to deny what was valuable in architects' work, but on looking back they would find that architecture was most successful when craftsmen or specialists combined to produce a building according to a plan in which there was a recognition of their specialties. We might have now wider aims, but the need for co-operation in architecture was as strong as ever.

Views were shown on the screen by the aid of the aerial graphoscope.

ROYAL INSTITUTE OF BRITISH ARCHITECTS.

A MEETING of the Institute was held on Monday evening last, Mr. H. L. Florence, vice-president, in the chair.

Mr. Francis Bond read a paper

On the Comparative Value of Documentary and Architectural Evidence in Establishing the Chronology of the English Cathedrals.

Mr. Bond opened his subject by a reference to his own researches at Waltham Abbey Church, which had led him to the conclusion that no portion of the work was of the early date assigned to it by Professor Freeman and other authorities, viz. the eleventh century; it had nothing in common with either English or Norman work of that period. Wells Cathedral was another example of what the lecturer termed archæological aberration. Some authorities dated the nave after the west front, though the nave was far more archaic in character; Professor Willis dated the west front after the nave, but put both a whole generation too late. Many instances of similar error might be cited, pointing to some flaw in the methods of research. The cause was to be traced to the wrong estimate of the comparative value of documentary and architectural evidence. Documentary evidence consisted of the references, direct or indirect, to the history of the building, in annalists, monastic chroniclers, fabric rolls, registers, wills, &c.; architectural evidence was to be sought in the stones and mortar. Discussing Professor Willis's opinion in favour of documentary evidence, the lecturer observed that few of the statements as to building operations in the cathedrals were made by contemporaries; frequently the authors lived generations or even centuries later. The ascription of the choir, transepts and nave of Wells, as well as the west front, to Bishop Jocelin was based on a statement of Bishop Godwin, who lived in the sixteenth century, which was itself based on an anonymous MS. written in the fifteenth century. Contemporary evidence could not always be trusted. Monastic and Mediæval chroniclers had likes and dislikes, and sometimes deliberately misrepresented and falsified their history—Matthew Paris's own admission was a case in point. Any good work, any fine building, erected by the unpopular, may have been attributed to the popular abbot or bishop. In this connection the lecturer referred to Bishop Aquablanca's work at Hereford Cathedral, which had been ascribed to Bishop Swinfield, and disproved the statement of Swapham and Abbot John, monastic chroniclers of Peterborough, that Abbot Benedict built the whole nave from the central tower to the west front. The chroniclers were not architects—their language lacked precision and definiteness; and it was dangerous to build theories on their curt and nebulous statements. They were often unintentionally misleading. The lecturer referred to a possible instance in the record in Simeon's "Continuator" of Flambard's work at Durham. Again, the chroniclers' statements had been applied to the wrong building—an instance at Ripon Minster was cited. There were huge gaps in the chronicles; some of the biggest works were not mentioned at all. It did not follow because there was no record of work by a particular bishop or abbot that therefore he did nothing. New evidence may be forthcoming, and the prelate who had been credited with no work might turn out to have been building busily all the time. As examples of the danger

of building theories on negative evidence, the lecturer showed how such theories had been upset in the cases of Wells and Worcester Cathedrals. Dates of consecration were not always of value; there were dozens of examples which had no reference to the completion of a cathedral or of any important part of it. Neither was it safe to infer that, because services commenced in a certain year, the building or any particular portion of it was completed; inferences of the kind were proved incorrect at Durham and Peterborough. The evidence, however, of contemporary fabric rolls, charter registers, &c., was of the utmost value if it could be properly read and understood. But the Latin of those documents was not easy to read; the abbreviations had proved a fertile source of error. MSS. had been carelessly copied or carelessly printed; in some cases terms had been altogether misunderstood. Striking instances of error from one or other of these causes were referred to in connection with Lincoln, Exeter and Hereford. Examples were further quoted showing that implicit confidence could not always be placed in mural inscriptions. Concerning architectural evidence, the comparative rather than the historical method of investigation, the lecturer considered that nowadays this class of evidence, subject to certain minor reservations, might safely be relied on. Allowance must be made for the progressive tendencies of the monks of the eleventh and twelfth centuries, for the conservatism of those of the thirteenth. The monks of Peterborough and Norwich retained their Romanesque minsters almost unaltered to the last. The canons of Lincoln, York, Lichfield and Exeter swept away almost every trace of Norman work. The abbey church of St. Germer, near Beauvais, Oxford Cathedral and Wimborne Minster furnished further examples of conservatism. Builders of the first half of the fourteenth century showed reverence for old work and refused to impair the effect of good old design, but they put their own trade-mark on the detail. Various instances were given, and some examples of "architectural forgery" referred to, as at Rochester, Durham Galilee, and notably the gateway of College Green, Bristol, and the church of Ottery St. Mary—buildings deliberately designed in the spirit of a bygone style. The detail, however, prevents the student misinterpreting the evidence of the architecture. It was possible to be misled by the precocity and cleverness of a Mediæval designer. Here and there a great original genius sprang forth, such as Suger's architect at St. Denis, who gave the world fully developed and harmonised Gothic construction in 1140, two generations before the choir of Lincoln Minster was produced. St. Urbain, Troyes, represented the full and final consummation of Gothic architecture, which was not reached elsewhere for more than a generation. Gloucester Cathedral afforded another instance of precocious genius. In conclusion, the lecturer expressed his conviction as to the general trustworthiness of architectural evidence, and quoted in support the authority of Mr. Barr Ferree and Mr. Edmund Sharpe. The architectural should be studied before the documentary evidence, and if the former conflict with the latter, then the latter should go to the wall.

The paper was illustrated by the aid of about fifty lantern slides.

A letter was read from the Bishop of London, who was unable to attend. Referring to Mr. Bond's paper, his Lordship said:—"Its main contention is that documentary evidence needs criticism in every case, and it is obvious that internal evidence supplied by architecture is one element in this criticism. The strength of this internal evidence grows by the continued application of the comparative method. It is much stronger now than it was thirty years ago. But I do not think that its results destroy the credibility of documentary evidence, but only teach us to interpret more accurately the exact meaning of the words and discriminate between an exact and an approximate statement."

The Chairman remarked that the letter of the Bishop of London did not cast much light on the subject, and was no more than an example of judicious hedging.

Mr. W. H. St. John Hope, who proposed a vote of thanks, did not quite agree with Mr. Bond in falling foul of what their predecessors had done. The researches of Professor Willis had led them to understand many things which materially helped the more recent investigations. A great point when making researches and testing documentary evidence was to see the original text, as faults in the copying or translation often arose and put a different meaning on things. Historians were sometimes unreliable, and when following them one was liable to fall into the same errors. There were three points especially that had to be dealt with in working out the histories of these churches—(1) the manner in which these buildings were constructed; (2) the question of the lengthening of churches and why it was done, sometimes for lady chapels, but often for the building of shrines, as in Canterbury, where the shrine of St. Thomas is still called Trinity Chapel, but in chronicles is known as the shrine of St. Thomas; (3) the reason of the pause that was made in building about the time of the Black Death in 1349.

Mr. William White seconded the vote of thanks. He said he had found that antiquarians and historians rather set aside the architectural evidence for the documentary, and he thought the reason was that very few of the antiquarians had sufficient knowledge to deduct the architectural evidence from the buildings. The architectural evidence was often so strong that it was hard to know why there should be any doubt as to the date.

Mr. H. H. Statham said he agreed entirely with what Mr. Bond had said, but it was necessary to understand that the documentary evidence was the basis of their chronological knowledge of these cathedrals. Architectural and documentary evidence combined helped them to check the dates.

Mr. E. W. Hudson supported the vote, to which Mr. Bond briefly returned thanks.

GENERAL.

Mr. E. J. Gregory, R.A., was on Monday elected president of the Royal Institute of Painters in Water-Colours.

Mr. James Murray, who was architect for the Buckingham Palace Hotel and various buildings in London, died on Sunday last in his seventy-fifth year.

A Bust recently purchased by the Russian ambassador at Madrid—the Christ with blue eyes—is pronounced by some experts to be the work either of Donatello or Michel Angelo.

M. Puvis de Chavannes left a great collection of his drawings as to which his will contained no provision. The family has resolved to distribute them among various public galleries, including those of the Luxembourg, the Hôtel de Ville and the towns of Amiens, Marseilles, Poitiers and Lyons.

Mr. Ernest Wilson has been appointed professor of electrical engineering in King's College, London, in succession to the late Dr. John Hopkinson.

An Ordinary Meeting of the Institution of Civil Engineers will be held on Tuesday next, November 29, at 8 P.M., when a paper will be read, with a view to discussion, on "The Effect of Subsidence due to Coal-Workings upon Bridges and other Structures" by Stanley Robert Kay, Assoc.M.Inst.C.E.

Subscriptions are sought on behalf of the family of the late Mr. Gleeson White, who was connected with various publications relating to art.

The Three Hundredth Anniversary of the birth of Vandyke is to be celebrated in Antwerp with becoming pomp. An exhibition of the painter's work will be held on a scale that will be comparable to that of the recent Rembrandt Exhibition in Antwerp.

Mr. G. T. Moore, assistant architect to the Dublin Corporation, has resigned, and a successor will soon be appointed.

An Art Exhibition, promoted by the Cheltenham and County Fine Art Society, will be opened in the Gallery, High Street, Cheltenham, early in February. All works from London and a distance must be delivered not later than January 14, 1899.

A General Meeting of the Society of Oil Painters Piccadilly, was held on Wednesday, when Sir Charles Reid P.R.S.A., and Mr. Ernest A. Waterlow, P.R.W.S., A.R.A., were elected honorary members; and Mr. Byam Shaw, R.I., Mr. Cecil W. Rea, Mr. Mortimer Menpes, R.I., Mr. Chas. I'Anson and Mr. Alfred Hartley were elected members.

St. John's Church, Smallwood, Cheshire, is being furnished with a new reredos of oak from designs prepared by Mr. R. B. Preston, architect, Manchester. The reredos will be a memorial of the thirty-seven years' connection with the parish of the late Rev. Edleston R. Williams, during the last thirty-five of which he was the vicar of Smallwood.

The Edinburgh Architectural Society met on the evening of the 16th inst., Mr. W. N. Cumming, the president, in the chair, when Mr. J. A. Morris, of Ayr, read a paper on architecture before a very large attendance. Mr. Morris dealt with his subject as an art in opposition to a profession, dwelling on the influences of our own day, which, he says, give great promise for the future.

The Papers to be read at the meetings of the Edinburgh Architectural Association during the present session are "A Sketch of Work in Galloway," by Mr. E. Forbes; "Explorations in Palestine and Jerusalem," by Mr. A. C. Dickie; "Some Words about Edinburgh Architecture," by Mr. T. A. Croall; "The Architectural Antiquities of Leith," by Mr. James Campbell Irons; "Plasterwork," by Mr. H. O. Tarbolton.

Great Activity now prevails at Assouan. All the workmen's dwellings, hospitals, hotels and other buildings necessary for Messrs. John Aird & Co.'s enormous staff have been finished. At the present time more than 2,000 natives are employed in blasting operations, and about 250 Italians are busy quarrying and dressing the building material.

THE

Architect and Contract Reporter.

IMPORTANT NOTICE.

WORKMEN'S COMPENSATION ACT.

In view of the many difficulties which are certain to arise in connection with the law, practice rules and procedure under the above Act, we have added to our staff A VERY EMINENT BARRISTER, who has made the subject a special study, and will be glad to answer in the columns of this paper any questions relating to the complicated matters arising from the provisions of this difficult Act. Our LEGAL ADVISER will further answer any legal question that may be of interest to our readers. All letters must be addressed "LEGAL ADVISER," Office of "The Architect," 175 Strand, London, W.C.

EDITORIAL NOTICES.

The authors of signed articles and papers read in public must necessarily be held responsible for their contents.

No communication can be inserted unless authenticated by the name and address of the writer—not in every case for publication, but as a guarantee of good faith.

Correspondents are requested to make their communications as brief as possible. The space we can devote to Correspondence will not usually permit our inserting lengthy communications.

TENDERS, ETC.

*** *As great disappointment is frequently expressed at the non-appearance of Contracts Open, Tenders, &c., it is particularly requested that information of this description be forwarded to the Office, 175 Strand, London, W.C., not later than* 2 P.M. *on Thursdays.*

NEW READING CASE.

To Librarians of the Public Libraries and Reading-rooms.—A new handsome Reading Case can be supplied at a nominal charge of 2s., by post 2s. 6d., on early application to the Publisher, 175 Strand, W.C.

For Advertisement Scale, see page xiii.

COMPETITIONS OPEN.

ABERAVON.—Dec. 1.—Plans are invited, with estimated cost, for the extension of the covered market. A premium of twenty guineas will be awarded to the architect whose plans shall be selected. Mr. Jas. Roderick, borough surveyor, Aberavon.

BRADFORD.—Jan. 2.—Designs are invited for erection of a central fire-brigade station. Three premiums are offered, viz. 100*l.*, 50*l.* and 30*l.* Mr. George McGuire, town clerk, Bradford.

BURNLEY.—Jan. 14.—The Burnley School Board invite designs for a new higher-grade school and pupil-teachers' centre, to be erected in Ormerod Road, Burnley. Competition is limited to architects having offices within 60 miles of Burnley. Mr. E. Jones, clerk, Town Hall, Burnley.

HARROGATE.—Jan. 2.—Competitive designs are invited for erection of a pump-room, &c., the cost of which must not exceed 8,000*l.* Premiums of 50*l.*, 30*l.* and 20*l.* Mr. Samuel Stead, borough surveyor, Municipal Offices, Harrogate.

HULL.—Jan. 1.—Designs are invited in competition for a central public library in Albion Street. Premiums 50*l.*, 30*l.* and 20*l.* Mr. Sidney R. J. Smith, 14 York Buildings, Adelphi, W.C.

CONTRACTS OPEN.

ELECTRIC NOTES.

ON Thursday last an instrument which combines the powers of the phonograph and the cinematograph was exhibited at the Empire Theatre of Varieties, Dublin. By its means living pictures are projected on to a screen, and simultaneously everyone in the house hears the sounds uttered at the time of the action represented in the picture. This is said to be the first time such a result has been achieved. Mr. Sinclair intends to exhibit his invention in London at an early date.

THE Wigan electric-lighting committee have now decided that an installation be put down to supply Wigan with electric light. The Council are at present waiting the report of the committee, who also have under consideration the running of the trams by electrical traction.

NOTICES have been given by the Stourbridge Urban Council and the Lye and Wollescote Urban Council of their intentions, respectively, to apply for provisional orders to enable them to supply the electric light in the districts which they severally control. The same urban districts are included also in the application which the Midland Electric Corporation for Power Distribution, Limited, are making for a provisional order for the extension of the area of supply already authorised.

THE employment on a large scale of electricity as a form of power has not yet been witnessed in the United Kingdom, although in America there are several already in existence and one is now being erected or rather reconstructed in New York which will produce some 70,000 horse-power. What may, however, be regarded as a start in this direction on this side is now about to be made. A project has been formed in Scotland which, if carried out successfully, will demonstrate to the people of this country how well-founded have been the predictions of those who anticipate that the application to human requirements by means of its conversion into electricity of nature's vast store of energy, now running, so to speak, to waste, will virtually amount to a revolution of our industrial system. The scheme referred to has been planned by Mr. George Anderson, civil engineer, Edinburgh, and should when completed be one of the triumphs of engineering. The promoters have already drafted their Bill for presentation to Parliament next session. The scheme contemplates the utilisation of the waters of Loch Ericht, which, along with those of various daughter lakes, will be conveyed by tunnel and aqueduct to the head of Loch Leven, some twenty miles distant, there to be converted into electrical power. The scheme is expected to cost one million, and the promoters calculate that 38,000 horse-power will be secured.

THE electric-lighting committee of the Edinburgh Town Council have determined not to be caught short-handed again with the enormous increase of applications for electric light, and they have decided to recommend the Council to accept estimates for machinery at their new station in M'Donald Road, Leith Walk, to the extent of 60,000*l*. Messrs. Mather & Platt, of Salford Ironworks, Manchester, are to get the order for the engines and the dynamos to the extent of about 40,000*l*. In all there will be six machines of about 13 horse-power each. Two of these machines are to be delivered under heavy penalties on August 15, two on September 15 of next year, and the remaining two on a later date. In all there will be seventeen boilers to contract for, which amounts to about

20,000*l.* Mr. Sinclair, Leith, has got the contract for seven, and Messrs. D. Stewart & Co., Glasgow, for six, also to be delivered on August 15 and September 15 respectively. The remaining four boilers, two from each contractor, are to be delivered at a later date. Altogether there will thus be installed next year at M'Donald Road more boilers and machinery than there is altogether at Dewar Place at the present time, and the committee will be able to supply more than double the present number of lamps. Since October 17 applications have been received equal to 7,252 8-candle-power lamps.

BUILDING AND BUILDERS.

CHRIST CHURCH, Greenheys, Manchester, which was erected in 1850, is being rebuilt in sections.

ON Monday Mrs. Kendal performed the ceremony of laying the memorial-stone at Mr. Morell and Mr. Mouillot's new Grand Theatre at Southampton.

THE foundation-stone has been laid of a new Established church in Walker Road, Aberdeen. The church will contain 818 sittings, and the cost will be 3,000*l.*

ON the 19th inst. the foundation-stone of a new Baptist chapel was laid in Dunfermline. Situated at the south-east end of Dewar Street, it is to provide accommodation for between 500 and 600 worshippers, and the cost is estimated at 2,000*l.*

LORD PROVOST RICHMOND, chairman of the Clyde Trust; Mr. James Deas, the engineer; and Mr. T. R. Mackenzie, the secretary, are in London in connection with the Clyde Trustees' scheme for the construction of a dock at Shieldhall, N.B.

ON the recommendation of Dr. R. J. Reece, inspector for the Local Government Board, the Wath, Swinton, Greasborough and North Rotherham Joint Hospital Board have decided to apply for 9,000*l.* to purchase a site for an infectious diseases hospital.

THE ancient church of Overton, near Lancaster, is to be improved and altered so as to bring it up to present-day requirements. Plans have been prepared and approved for carrying out the work, which is expected to cost upwards of 1,000*l.* The existence of Overton church can be traced to 1140.

AT the Smethwick Police Court on Wednesday, Mr. J. H. Coy, of Oakland Villa, Albert Road, Stechford, was summoned at the instance of the District Council for infringing the building bylaws by allowing four houses in Milcote Road to be occupied, on October 17, without first obtaining a certificate authorising him to do so from the surveyor. Mr. Botterley (Messrs. Shakespeare & Co.) prosecuted, and said that at a previous court a contractor named George Gittin, of Barford Road, Birmingham, was summoned for the offence; but he then pleaded that he was only the builder for Coy, and the case was adjourned for a week in order that Coy might be summoned. Defendant pleaded that if a technical offence had been committed it arose through ignorance. The Bench fined the defendant 3*l.* 4*s.* 2*d.*, including costs. The case against Gittin was dismissed.

THE finance committee of the Aberdeen Town Council visited the fish market last week for the purpose of inspecting the sites suggested for the proposed extension of the market buildings. It was decided to recommend the Council to carry the extension along the Market Street wharf. The cost of the extension is estimated at from 3,000*l.* to 4,000*l.*

WHILE some masons were working at the chimney of a house in the course of erection at Ballyclare, Ireland, and just as they were about to unfurl the flag indicating that the masonwork was completed, the gable and back wall of the building collapsed, precipitating to the ground two men. On their being extricated from the débris it was found that both had been seriously injured.

THE Liverpool city coroner held an inquest on the 22nd inst. touching the death of William M'Lachlan, fifty-one years of age, who had lived in Henderson Place, Cranmer Street. The deceased was working on a scaffold outside Messrs. Tate's factory, and when mounting on to the platform of the scaffold from a window of the building he slipped between the platform and the wall and fell to the ground, a distance of 40 feet. He was taken to the Northern Hospital, where he died the same evening from fracture of the skull. Verdict, "Accidental death."

SOME old premises in Bull Street, near Corporation Street, Birmingham, belonging to the Horton estate, and which are being demolished in connection with the scheme for widening Bull Street, partially collapsed shortly before midday on Wednesday, and at one time the danger of the whole front falling out into the street was very imminent. Some workmen were removing a 4½-inch wall on the right side of the building when it suddenly collapsed, and some men working below had a very narrow escape. Communication was sent to Mr. F. W.

Vol. LIX. of THE ARCHITECT. Handsomely Bound in Cloth, Gilt Lettered, Price 12s. 6d. Office: 175 Strand, London, W.C.

Rinder, the surveyor, and he was quickly on the spot. He found that the front of the building was bulging, one corner of it only being sustained by two slender iron columns. Traffic along the street was immediately stopped, and steps were taken to support the building, which was rapidly becoming more dangerous. Scaffold poles and planks were temporarily used, and raking shores were brought into requisition as quickly as possible, but the street was blocked until nearly nine o'clock at night.

THE foundation-stone was laid on Saturday afternoon of a church which is in course of erection at Stirchley, King's Norton. The site of the new church abuts on the High Street, Stirchley, and is in proximity to what was formerly a school-house. The church has been designed in the later Decorated style of Gothic architecture, and consists of a nave 82 feet long by 35 feet wide in the clear, with north and south ambulatory aisles, each having five bold but low arches from the nave. The chancel will be 32 feet 6 inches by 22 feet. On the south side of this will be the clergy and choir vestries, the latter being carried up as a tower, in which will be the organ-chamber over the vestry; and again above the organ-chamber will be a ringing-loft and belfry large enough for a peal of eight bells. At the western end of the nave, and connected to it by a triple arcaded and traceried opening, will be the apsidal-shaped baptistery, and north and south porches and inner porches, and above the triple arcade will be a large window. Over each of the nave arcades there will be ten two-light traceried windows, and carved corbels and shafts supporting eleven hammer-beamed principals and intermediates, having traceried spandrels; while bold flying buttresses, whose arched soffits will be visible inside the shallow aisles, will stiffen the walls carrying the wide spanned roof. The chancel will have a seven-light east window, two windows of two lights each on the north side, and one on the south side. The roof of the chancel will be waggon-shaped, and divided by ribs into panels. All the walls will be built of brick throughout. The external dressings are to be of red terra-cotta, on account of its greater durability than stone in a manufacturing district, and the internal piers, arches and other dressings will be in selected Farleigh Down Bath stone. There will be kneelings for 578 adults. In the architect's design a morning chapel, on the north side of the chancel, was shown, but this is not being carried out at present. A heating apparatus vault is provided in the tower basement. Mr. William Hale is the architect, and Mr. Thomas Smith the builder.

VARIETIES.

THE inauguration of the Opera Comique at Paris, which is now imminent, will be the occasion of an official gala, to which invitations will be issued by the President of the Republic.

THE Midland Railway Company are asking, in their Bill for next session, for powers to enlarge their station at Sheffield. The scheme differs considerably from that which was contained in last year's Bill. It is much larger, and the cost is likely to reach 300,000*l*. For the purposes of the enlargement the company recently acquired The Farm, the Sheffield residence of the Duke of Norfolk.

THE new chapel erected by the congregation of St. Patrick's Roman Catholic parish at the junction of Maitland Street and Arthurstone Terrace, Dundee, was formally opened for public worship on Sunday, the 20th inst. The general style of the building, which cost about 7,000*l*., is modern Gothic. The external dressings are of red Dumfries stone, while the bull-nosed rubble is from Borvingmuirhead.

A NEW Episcopal church in Torry, Aberdeen, was formally opened and dedicated on the 16th inst. by the Bishop of Brechin. The church has cost about 5,000*l*., and is seated for 600 worshippers.

AT St. Mary's and St. Alkelda's Church, Middleham, on Friday, a dedication service was held by the Ven. the Archdeacon of Richmond to consecrate the font canopy after its restoration. The canopy, which was recently discovered after being lost for some time, is a beautiful eighteenth-century one. It stands about 6 feet high, and consists of three tiers of open woodwork. The estimated cost of its restoration was 50*l*.

A NOVEL method of road-making has been adopted on the site of the great subsidence at Northwich. A heavy timber frame 112 feet long and 36 feet wide was prepared by direction of the county surveyor, laid on the London Road, and covered with cinders. It should effectually prevent sudden collapse. The chasm, which has swallowed upwards of a thousand tons of material, is completely filled and the road is now opened. The cost of the rough restoration is estimated at 300*l*.

A MEETING in aid of the restoration of Peterborough Cathedral was held on the 21st inst. at the Town Hall, Stamford, under the presidency of the Mayor, when an address explaining what had been and what still remained to be done was given by the Dean of Peterborough. A collection in the room realised the sum of 43*l*.

THE consecration of St. Edward's Church, Birmingham, took place on the 21st inst. The church and schools were bought from the Presbyterians for 1,700*l*., and given to the Church of England. The rebuilding and refurnishing cost upwards of 1,300*l*.

THE annual dinner of the Builders' Benevolent Institution took place on the 17th inst. at Carpenters' Hall, London Wall. Mr. B. J. Greenwood (president), who occupied the chair, proposed the toast of "Success to the Builders' Benevolent Institution," and contended that the charity was deserving of support, as it acted the part of the Samaritan to those who had fallen by the wayside in the rush of life. Since its formation nearly 300 people had been assisted, and recently, in consequence of the great age of some of the candidates, the committee had decided to elect without the necessity of canvassing all who were eligible. The toast was drunk with enthusiasm. In the course of the evening subscriptions were announced amounting to 875*l*.

CONSIDERABLE structural alterations have recently been made at the London offices of the Caledonian Fire and Life Insurance Company. The offices are situated in King William Street. The alterations have mainly taken place in the Life Department of the office, and consisted of the removal of heavy cross walls and a stone staircase from the ground floor, and the substitution of an internal mahogany staircase leading from the general offices on the ground floor to the secretary's and other offices situated upon the first floor. The new life office has been refitted with handsome mahogany counters and fittings. The general contractors for the works were Messrs. Thompson & Beveridge, of Albany Street, N.W. The alterations were designed and carried out under the personal supervision of Mr. Howard Chatfeild Clarke, of Bishopsgate Street Within.

THE excellent programme at the Alhambra has been still further strengthened by the engagement of La Belle Otero, who in her particular line is unapproachable. It is true that both her singing and dancing may be somewhat wanting in true *technique*, yet she sings and dances with such *entrain* that she fairly magnetises her audience, who acclaim her with delight and recall her again and again. Mr. Dundas Slater has again played a trump card in securing this beautiful artiste for the ten evenings which she has at liberty previous to her extended foreign tour. Other items of the attractive bill are the divertissement, "Jack Ashore," which retains all its freshness; Miss Juliette Nesville, who perhaps might with advantage try a new song; the excellent Bonhair troupe of acrobats; Les Minstrels Parisiens, who are giving some fresh items from their extensive *répertoire*; Permane's splendidly trained bears, and many other excellent turns.

THE Board of Trade have under their consideration the question of increasing the facilities for embarking and disembarking passengers and for handling the mails at Holyhead harbour. Holyhead harbour and roadstead were transferred from the Admiralty to the Board of Trade in 1863 by the Harbours Transfer Act, 1862, and both before and since that date large sums of money have been expended by the Government on its maintenance and improvement. At present passengers travelling by the London and North-Western Railway Company's steamers running between Holyhead and Kingstown use the quays on the inner basin of the old or inner harbour, while the mails are embarked and landed at the mail pier in the outer area of the old harbour. This pier is a wooden one, is too small and otherwise not well adapted for the large steamers that carry the mails, and is very costly to maintain. The construction of a substantial and commodious pier at Salt Island, outside the old harbour, which could be used by the mail steamers, would be of great advantage to the mail service and to the harbour, but the expense involved in the construction of such a pier has hitherto proved an obstacle to the execution of the project. Negotiations have for some time past been in progress between the Board of Trade and the London and North-Western Railway Company for the sale to the latter of the old harbour (now under lease to them for a long term of years), together with the adjacent quays and land,

and if these negotiations are brought to a successful conclusion it will no doubt facilitate the action of the Board of Trade in carrying out the much-needed improvement by the erection of a pier which will meet the requirements of the mail service for many years to come.

THE new Industrial School for Boys at Offerton, Stockport, which takes the place of the school vacated in a populous part of the borough, was opened on the 17th inst. Sir Joseph Leigh presided over the gathering in the assembly hall. A statement made by the Rev. E. Hedley (secretary) showed that the ndustrial school movement in Stockport started in 1854, with four boys in a small house. The care of girls was afterwards entered upon. In recent years a separate girls' school was built further out of the town, accommodating fifty girls, and now a little further out still in the country the boys' school was built, accommodating 150. The building included workshops, &c., and they had 5 acres of land. In 1866 the Stockport Industrial School was certified by Government, and since that time 1,000 boys had been dealt with. Mr. George Walthew (treasurer) said altogether the new school scheme would absorb 12,300*l.*, and of that sum they were now 3,669*l.* short. The money raised included 726*l.* in subscriptions, a grant of 600*l.* from the Cheshire County Council, 400*l.* from the London School Board, and 200*l.* from the Halifax School Board. It was a fact worthy of being placed on record that no less a sum than 5,001*l.* had been derived from the profits made by the school. The sum of 2,249*l.* had been transferred from the school accounts, and 2,751*l.* called in from investments. They had got the five acres of land there at Offerton for 1,000*l.*, or about a halfpenny a yard, and he thought Colonel Turner deserved special thanks for selling at such a reasonable price. Mr. Whiteley spoke of the importance of the particular phase of education carried on in such schools amongst the waifs and strays of society, and reminded those present of the advances made in educational matters all round during the last thirty years. Mr. Henry Bell, Mr. F. R. Robinson and other gentlemen took part in the proceedings.

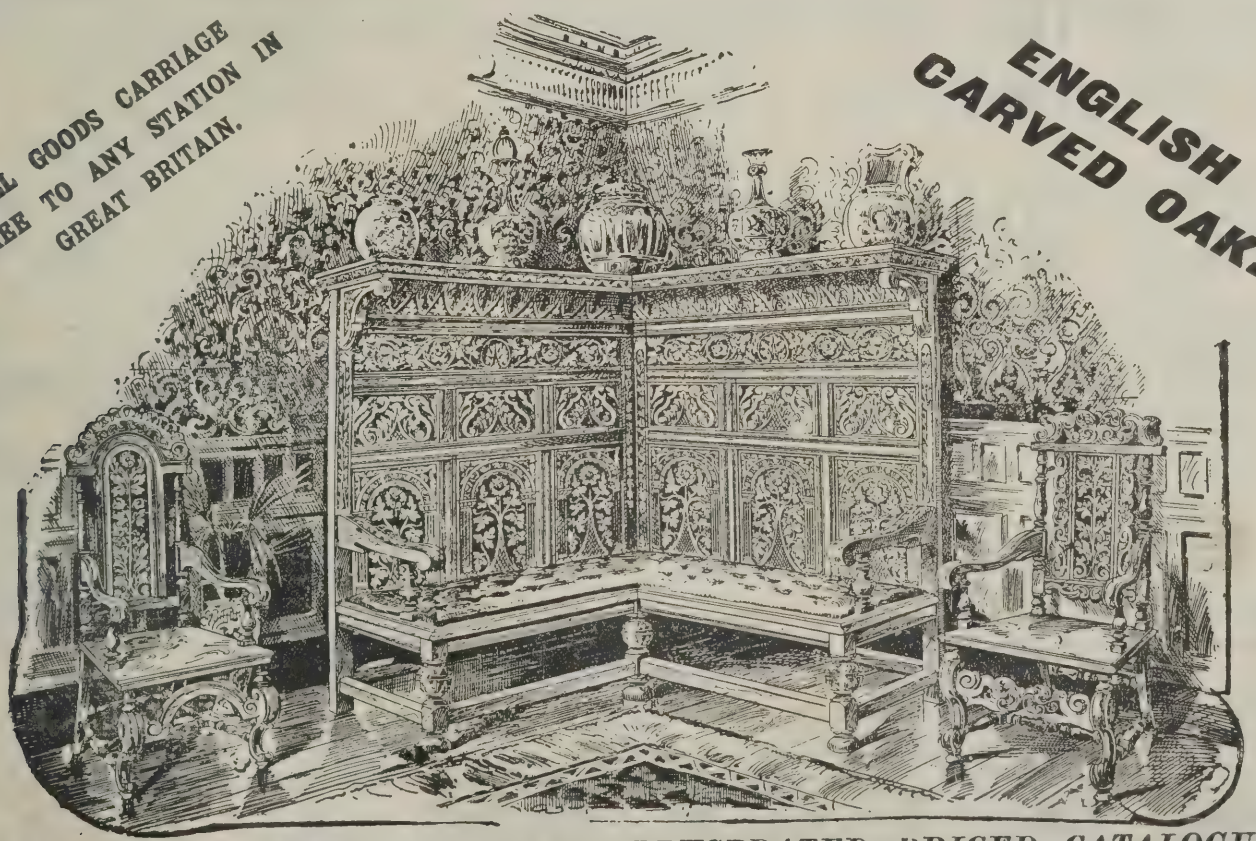
TRADE NOTES.

THE new schools, Eastbourne, are being warmed and ventilated by means of Shorland's patent Manchester grates.

MESSRS. CLARK, BUNNETT & CO., LIMITED, inform us that they have received an order for eighteen hand-power lifts at the new schools for Christ's Hospital, Horsham, under Messrs. Aston Webb & E. Ingress Bell, architects. Also for two hydraulic bed-lifts and six service lifts at the Hendon Asylum, for the board of managers of the Central London Sick Asylum District, under Messrs. Giles, Gough & Trollope, architects.

IMPROVEMENTS IN BRONZE CASTING.

AT a meeting of the Société des Ingénieurs Civils de France M. E. Maglin made a communication on the casting of bronze statues, in which he sketched the art of working in bronze from the earliest ages, while dwelling more particularly on the method of moulding known as the waste-wax process (*moulage à cire perdue*). In recent times, he observed, several inventors had endeavoured to make moulds of gelatine, the results of which were not encouraging, but it was given to a French sculptor—M. Le Bourg—to devise a method perfect as regards the results obtained, and also the saving in labour.



The process in question depends upon the fact that gelatine, with the addition of glycerine and glucose, preserves a constant elasticity even when exposed to the atmosphere, and by its means a statue may be moulded in its entirety, being surrounded by an envelope or covering in two parts, which are detached with great facility, while producing moulds of remarkable sharpness. In this manner a wax (une cire) is obtained by a single pouring, the seam of the mould joint being easily removed, since it is upon soft wax that the retouching has to be effected. This done—by the ordinary methods of the waste-wax process—the statue to be reproduced is covered with slip (barbotine); the wax is melted out, and the bronze is run into the mould after the jets and vents have been arranged. The specially original point about this method is that, while affording a considerable number of copies absolutely identical, it is independent alike of the sculptor, the chaser (ciseleur) and the bronze mounter.

M. Maglin also observed that M. Le Bourg had made other improvements, some for preventing cracks in the wax, and others for producing various patinas in a dry manner by oxidation. At the same time he showed a series of models in different stages of progress for illustrating the details of the successive operations.

The president, M. Edouard Lippmann, asked if the method that had been described was public property, and if not, whether it was applicable to the same compositions of metal as

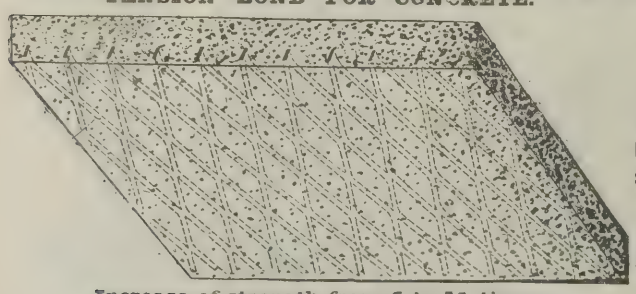
those for other methods of moulding, to which M. Maglin replied that the method was not public property, and that it was applicable to the mixtures of metal usually employed, but the bronze could be cast at a greater heat.

To a question by M. J. Gaudry, whether the method was suitable for large statues, the author replied that, as the chief object of the method was to afford a considerable number of copies, it had chiefly been applied to statues of ordinary dimensions, although it had also been employed for others of greater size, while in theory there was no limit in this respect.

M. Périssé mentioned the case of a large equestrian statue which, instead of being cast in several pieces and afterwards united by internal sockets (manchons), was formed of one single cast piece, although the casting was effected in several jets or pourings. This was the statue of Etienne Marcel, intended for the Paris Hôtel de Ville, and shown—rough as it left the mould from the atelier of MM. Thiébaut Frères—in the wide central gallery of the 1889 Paris Exhibition, where it attracted great attention from connoisseurs. The method of producing this statue consisted in casting separately the ten parts, which could not have been cast all together in the ordinary manner without liability to fracture during contraction, viz. the four legs of the horse; the two arms, head and legs of its rider, and also the horse's tail; and then in putting these ten parts in their proper places in the general mould in such a manner as to obtain, thanks to certain precautions, an intimate union of the metal, advantage being taken of the heat in the last bronze run for effecting the "firing on."

This method, which greatly simplifies the moulding while insuring a better casting, had already been adopted with success for parts of existing statues that required changing; but, for the operation to succeed, it was necessary that the molten metal should circulate in sufficient quantity over the parts to be connected by fusion, for which object pockets, or jets, were arranged, the excess of metal being received outside the mould. Such precautions were taken for the equestrian statue above mentioned, in which case, however, there was this exceptional difficulty, that the firings-on or fusions had to be effected at ten different points simultaneously. Indeed, the sockets (manchons) for each of these ten parts had been cast previously; and above each socket there had been arranged, in the general mould, a feeding pocket, which had furnished metal in excess for fusing the extremities of the ten parts. It is thus that the eleven parts of this equestrian statue only formed a single whole, which formed such a prominent figure at the last Paris Exhibition, although it is not this identical statue which was erected in front of the Hôtel de Ville, because the Paris Municipality insisted on strict observance of a certain clause in the contract.



In connection with an observation by M. Roget, that M. Le Bourg's method produced works of art differing widely from those to which the public are accustomed, and that perhaps a little educating up will be required before its delicacy is appreciated, M. Maglin expressed the hope that, inasmuch as reproductions by this method had already received the sanction of artists, they would eventually be appreciated generally, and also raise the tone of public taste—to which one circumstance greatly contributed, viz. that perfect replic s could be obtained at a lower rate than heretofore.

In reply to a question by M. E. Badois, M. Maglin added that about one hundred reproductions might be made with one and the same mould, but that when the gelatine process was used such moulds only lasted for five or six castings.

BIRMINGHAM MASTER BUILDERS' ASSOCIATION.

THE annual meeting of the Birmingham Master Builders' Association was held on the 17th inst. at the Grand Hotel, Mr. J. Bowen presiding. The annual report, presented by the chairman, stated that the committee were able to record that the period of good trade mentioned last year had continued. With increased prosperity in the building trade there had been greater competition, in many cases the advance in contract prices obtained being insufficient to cover increased cost of material and labour. A notice had been received from the bricklayers asking for alterations in rules and a rise in wages to 10*d.* an hour. That notice would receive the careful attention of the committee, and it was felt that uniform working hours must again be secured. It had become year by year increasingly evident that to successfully combat the ever-growing demands of the operatives it was necessary that they should be dealt with by an amalgamation of towns rather than by individual associations. Federations of employers having been established in Lancashire and Cheshire and the West of England, and the attention of the National Association having been drawn to this great need, England and in Wales had been divided into four federation areas. The committee had had under their consideration the new regulation of the public

PRICE LIST AND ESTIMATES ON APPLICATION.

works committee of the City Corporation, that before making connections to the sewers a deposit should be made to cover the cost. A deputation waited upon the public works committee and endeavoured to obtain some modification of this arbitrary requirement, but they regretted to report that their efforts were unsuccessful.

The Chairman congratulated the Association upon the progress that had been made. The membership had increased during the year from sixty-nine to ninety-three. The desirability of every builder in the district joining the Association could not be too strongly insisted upon, especially in view of the formation of the Midland federation. Now the Birmingham radius had been extended he hoped builders in the outlying districts would see their way to join the Association. With trade societies taking up a strong position, and constantly federating, it would be impossible for them as employers to hold their own unless they took united action.

The following officers for the ensuing year were re-appointed :—President, Mr. J. Bowen; vice-president, Mr. F. G. Whittall; treasurer, Mr. G. Twigg; secretary, Mr. E. J. Bigwood.

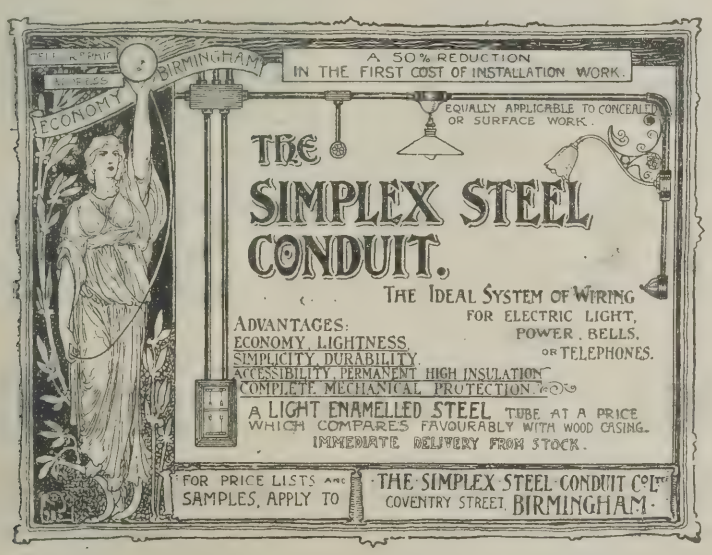
The Secretary, in acknowledging his appointment, stated that financially the Association was in a better position than ever it had been. The total receipts amounted to 311*l*, and after all liabilities there was a balance of 172*l*. He regretted that more consideration was not shown to the trade by the City Council, and he thought their only remedy was to return a practical builder to the Council.

The meeting then terminated.

The annual dinner was held in the evening at the Grand Hotel, Mr. John Bowen presiding. Among those present were Alderman Edwards, Councillor Baker, County Councillors Mogg and Bigwood, F. G. Whittall, J. Price (city surveyor), G. Willcock (Wolverhampton), W. Sapcote, J. Barnsley, E. Harper, C. H. Barnsley, J. Biggs, W. E. Lee, C. Silk, J. Webb, R. Bulley, J. A. Harper, H. Rudder and T. Johnson.

After the usual loyal toasts had been honoured, Mr. C. H. Barnsley gave "The City and Trade of Birmingham."

Alderman Edwards, who replied, spoke of a prophecy which was made to him forty years ago to the effect that within the ensuing twenty-five years Birmingham would be half rebuilt. It had turned out to be perfectly true, and it might have been repeated with equal truthfulness many a time since. In fact, Birmingham was still in the course of being rebuilt. He had been reported as saying that within his recollection the particular district in which he spoke had gone up 50 per cent. in value ; but what he did say was that it had gone up 50 per cent. within the last ten years. He remembered perfectly well when the site on which that handsome room stood was actually under a building lease of 3*d*. per yard. Now it was honestly worth 1*l*. per yard. There were leases running in Lionel Street which were granted at ½*d*. per yard. That suggested the enormous development of the city. As a further illustration of this point he contrasted the scope of, and the difficulties which attended the building of, the old General Hospital with the magnificent subscription list which was provided for the building of the present establishment, and the time in which the building scheme was carried through.



In responding to the toast of "The Association," which was submitted by Mr. W. Hale, the President said the Association was making progress, for during the year the number of members had increased from sixty-three to ninety-three. They did not combine simply to advance prices to an unreasonable extent, but to uphold their rights and privileges. The time had come when the builder should be regarded as equal to the member of any other trade or profession. Speaking of trade unions, he recognised the good which they did for the worker, but expressed the opinion that the time would come when they would reach the limit of concessions which the masters could safely grant them. The federation which the workers had established had made a similar movement for the employers necessary, and the Master Builders' Association of Great Britain had taken up the matter and formed four federations. That of the Midlands would embrace eleven counties and the whole of North Wales, and it was hoped that it would be in working order during the year. He hoped that the difficulties which lay before them would be dealt with in a conciliatory spirit.

Other toasts were proposed or responded to by Mr. Whittall, Mr. E. Harper, Major Barnsley, Messrs. W. Sapcote, A. Smith, T. Johnson and J. Price.

Mr. Leonard Courtney, M.P., also addressed the meeting.

GLADSTONE MEMORIALS.

IN order to clear up the misconception which evidently exists in some quarters regarding the memorials to Mr. Gladstone, it may be well to state that, apart from purely local movements in this direction, there are three undertakings which have a

READING CASES for THE ARCHITECT. Price 2*s*.—Office: 175 Strand, London, W.C.

wider range, namely (1) The statue to be executed by Mr. Brock, R.A., and placed in Westminster Abbey, the cost being defrayed out of a vote of the House of Commons. (2) The Liberal party memorial, a statue to be executed by Mr. Pomeroy, and to be placed within the Houses of Parliament. (3) The national memorial to Mr. Gladstone, which is entirely non-political, and is intended to commemorate Mr. Gladstone's services to his country rather than to his party. The entire absence of political significance in the national memorial is emphasised by the fact that the Prince of Wales has been pleased to accept the position of president of the general committee, and has subscribed to the funds; that many of the most prominent members of that committee were Mr. Gladstone's political opponents, and that the majority of the Lord Mayors and Mayors of England, of the Lord Provosts and Provosts of Scotland, of the chairmen of county councils in England and Scotland and of the mayors and chairmen of Town Commissioners in Ireland are also members of the general committee. The form which the national memorial is to take, as decided by the general committee at the meeting at Grosvenor House on July 21 last, is the offer to erect in London, Edinburgh and Dublin, not merely statues, but "monumental memorials," which it is intended shall be something more elaborate and decorative than the sculptured figures which are to be seen in so many of our public places. The committee also propose to erect at Hawarden a building for the suitable housing of St. Deiniol's library, which was collected and arranged by Mr. Gladstone's own hands, and is at present contained in a temporary iron structure. The cost of these three monumental memorials and of the building for the library will be at least 50,000*l.* The amount hitherto contributed is nearly 21,000*l.*, but active efforts are being made in many of the great centres of population in the United Kingdom to stimulate public interest in this national movement by holding public meetings, forming local committees and organising a system of canvassing for subscriptions. In many cases the results of these efforts have not been reported to the general committee. Steps in this direction have been taken in Lancashire, Cheshire, Mid-Lothian and other counties, and also in many cities and towns. Several sites have been suggested as suitable for the monumental memorials, but no definite decision on this point has yet been arrived at. As already mentioned, satisfactorily to carry out their first purposes the committee require 50,000*l.* Should the response to their appeal produce, as is confidently hoped, a larger sum than is necessary to carry out these primary objects, the executive committee will lay before the general committee at a future date suggestions for the application of the surplus fund to some purpose or purposes of general utility and interest suitable to be specially associated with Mr. Gladstone's name.

CLYDE DOCK EXTENSION.

GREAT satisfaction has been expressed in Glasgow and neighbourhood at the proposals of the Clyde Trust for the extension of the dock accommodation, says the *Glasgow Herald*. The official description of the docks at Shieldhall and Yoker is as follows:—Shieldhall Dock will have about 45 acres of water area. It commences by an entrance at the eastern boundary of Braehead, the property acquired by the Corporation last year for the south side sewage scheme. It comprises a large outer basin nearly rectangular in shape, 900 feet long by 800 feet wide; a north basin extending eastwards fully 850 yards parallel with the river and 250 feet wide; and a south basin of the same width, between 600 and 700 yards long, extending eastwards also, with a pier between, 270 feet wide. The total quayage is fully 4,000 lineal yards. There is a riverside quay or wharf 300 yards long in extension westwards along the river wall from the west end of the wharf at present in course of construction. There is a division southwards of Renfrew Road to enable the dock to be constructed, and to give ample quayage accommodation for mineral and general traffic, the total width between the face of the new river quay and the north side of the diverted road being 1,450 feet. Clydebank Dock will be on the north side of the river, occupying all the land between the river and the Lanarkshire and Dumbartonshire railway, from the east boundary of the Clydebank Shipbuilding yard to the west boundary of the Yoker estate. The water area will be about 19 acres and the total quayage 1,800 yards. The proposed dock will enter immediately east of Clydebank yard into a canting basin of ample dimensions which extends eastwards. The basin will be 600 yards long by from 250 to 300 feet wide. The plans also embrace the widening of the river on the north side in front of the proposed dock. The site of the new dock is just opposite the Cart. The Clyde Trust is also in negotiation for the purchase of about 20 acres of ground on the north bank of the river between Sawmill Road and Barclay, Curle & Co.'s shipbuilding yard at Whiteinch.

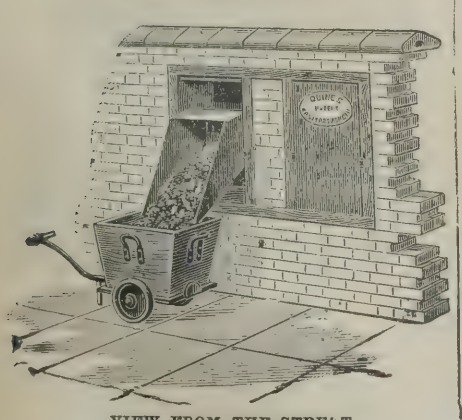
The ground, which belongs to Mr. Crawford Stuart, lies between the Lanarkshire and Dumbartonshire railway of the Caledonian system and the river. The acquisition, which is said to be practically arranged, is being made merely as a precaution to meet future requirements.

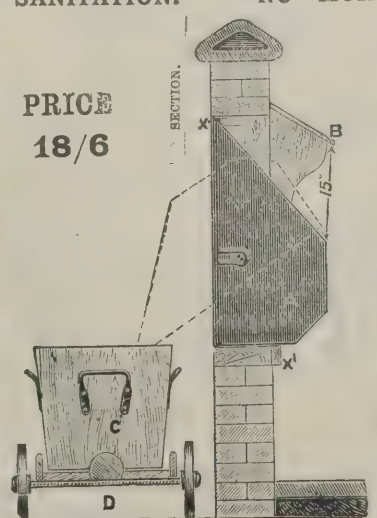
PLUMBERS' REGISTRATION.

A CONFERENCE of representatives of various bodies interested in a Plumbers' Registration Bill was held in the Carpenters' Hall, London Wall, E.C., on the 18th inst. The conference was convened by the National Association for the Promotion of Technical and Secondary Education, with the object of considering under what conditions the Plumbers' Registration Bill of last session would be acceptable to all the parties interested. Mr. J. C. Preston (master of the Carpenters' Company) presided, and the attendance included representatives of the County Councils' Association, of the local authorities of London, Manchester, West Riding, Surrey and Kent, and of a number of Royal Societies. After considerable discussion, resolutions were passed, it being understood that they were passed without prejudice to the question of whether any Bill for the national registration of plumbers be introduced or not:—"That if a Bill be introduced it should provide that there will be placed upon the registration council (*a*) directly appointed representatives of local municipal authorities aiding plumbing classes, and (*b*) an adequate number of directly appointed representatives of teaching institutions, any of such additional organisations as are specially interested in the education and registration of plumbers; and also that the examination for the purposes of registration should test the candidates' general knowledge of other sections of the building trade in addition to their special knowledge of plumbing; and that in any Bill the council created by the Bill should be the actual managing body, and have direct charge of the registration; and further, that the conduct of the Bill should not be left in the hands of any one body."

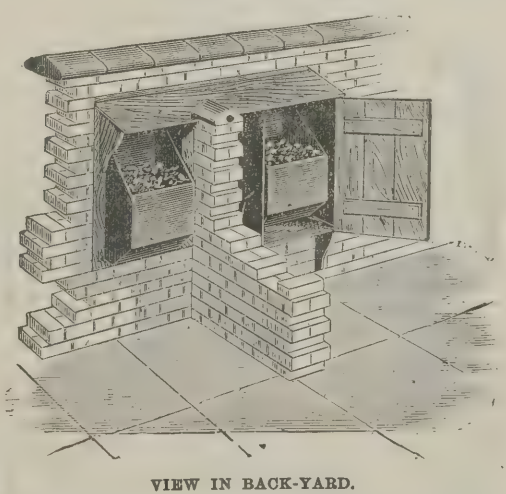
EXTRA PAYMENTS ON CONTRACTS.

THE subject of extra payments on contracts, of interest to all engineers and contractors, is one involving a number of interesting legal questions which must be passed upon by courts before it is possible to say what is the real standing of claims for such work. In contracting, as in any other business, differences of opinion between parties will always arise, and where these differences cannot be settled by mutual agreement between the parties interested, then recourse must be had to the law. It is all very well for engineers to say that such and such specifications are the best, but it should be borne in mind that after they have had their say the courts may reverse their opinion. A recent case before the United States Circuit Court in the district of Utah illustrates, says the *Engineers' Record*, this point very clearly, and a review of the decision, 83 Fed. Rep. 784, will doubtless interest both engineers and contractors.





In March 1891 the city of Salt Lake City received bids for constructing a 36-inch concrete and brick aqueduct about 6 miles long, "according to the plans and specifications in the office of the city engineer." With the plans there were filed twenty-two paragraphs entitled "Instructions to Bidders."



Messrs. E. L. De Bois & Joseph Williams bid for the entire work, but the masonry alone was awarded to them, the grading and tunnelling being let to other parties. In the contract the different kinds of work were specified as in the instructions to bidders, and a price was set opposite each class of work. The contracts contained no statement of approximate quantities, but it referred to the bid of these parties, which contained the amounts of the classes of work as given in the instructions. De Bois & Williams failed after the work was commenced, and Mr. Joseph H. Smith and his associates, the plaintiffs in the case, assumed the management of the business and finished the aqueduct. The suit was brought to recover a reasonable value for the work done by them which was alleged to be in excess of the contract.

The main controversy was over the statement of approximate quantities in the sixth paragraph of the instructions to bidders, which read:—"For the purpose of arriving at the comparative value of the respective bids, the following quantities will be taken as approximating the actual quantities which the execution of the work will develop, and shall be used for no other purpose in connection with this contract." The city maintained that the effect of this language was to withdraw the sixth paragraph from the contract, leaving that instrument without any statement of quantity, and binding the contractors to build the aqueduct in any form or place, and with any materials mentioned in the contract which might be designated by the city engineer.

In the opinion of the court, written by Judge Hallett, this

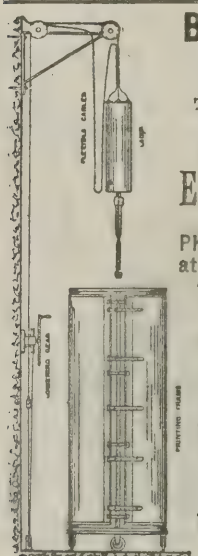
construction of the contract is held to be untenable. He says that the sixth paragraph of the instructions must have been drawn to enable bidders to understand the work which they were to undertake. A survey of the line of the proposed aqueduct and an estimate of quantities were essential to intelligent action. No bid could be made without such survey and estimate, and it will be noticed that the invitations for proposals specifically mention plans and specifications in the office of the city engineer. To eliminate the sixth paragraph on the ground that it was operative only to enable the city to select a low bidder would give the city the right to force the contractor to build any kind of an aqueduct which the city engineer might designate, either underground or on stone archways in the style of the Roman Empire.

The principal items in controversy were for cut-stone and rubble masonry, 30 cubic yards in all. According to the report of the city engineer, the cut-stone masonry actually employed amounted to 535 cubic yards, and the rubble masonry to 403 cubic yards, while the plaintiffs' estimates were somewhat larger. Obviously there was a nominal specification of stone masonry in the contract, while a large and substantial construction of stone was actually required. There was a material departure from the plans and specifications which resulted in a new and different undertaking, upon which the plaintiffs were decided to be entitled to recover the value of the work done by them in excess of the contract.

Judge Hallett said further that other considerations led to the same decision with equal force and clearness. The greater part of the extra work was in a cañon about a mile long, where a dam and settling basin not mentioned in the contract were built at the head of the aqueduct. At the preliminary trial of the case a question arose as to whether the line of the aqueduct in the cañon had been changed after the date of the contract. The city engineer and others testified that no survey had been made on the site of the cañon near the aqueduct until after the contract was let. Other parties testified that a line was pointed out to them, which they examined with a view to making proposals for the work. The evidence on this point was not considered as of much importance, however, because the contract was held to settle the question. The city invited proposals for building the aqueduct according to plans and specifications in the office of the city engineer, and the contract was that the work should be done in conformity with these plans and specifications. In this a survey and location of the line in all its parts was held to be assumed, inasmuch as plans and specifications cannot be properly made without such survey and location. Upon the contract alone it was held that the line of the aqueduct on the site of the cañon was surveyed and located before the contract with De Bois & Williams was made. "It was not necessary to say that this presumption is conclusive. It is enough to say that it supports the testimony of the bidders that a line was shown them on the side of the cañon somewhat lower than that on which the aqueduct was built, where but little stone or tunnel work was required. The location of the rejected line seems also to be indicated by the statement of nominal quantities of stone and tunnel work in the approximate quantities."

All that has been said in respect to stone masonry was also held to be applicable to tunnelling. The amount of this work specified, 160 yards in all, was far less than the work actually done. Judge Hallett entertained no doubt as to the exceptional cost of the tunnel work over the trench work. This view of the case, therefore, led him to give a verdict for the plaintiffs, and to grant their motion for a new trial.



THE LATE SIR JOHN FOWLER.

WE announce with regret, says the *Times*, the death of Sir John Fowler, the eminent engineer, which occurred on Sunday at Bournemouth, after a long illness.

This event removes from our midst one who in a peculiar degree was representative of modern engineering achievement. He was one of the few great engineers remaining whose reputation was made amid the first mad rush of early railway enterprise; he had lived to bear largely upon his individual shoulders the burden of constructing the so-called "Underground railway," an achievement which for the time when it was carried out was one of gigantic difficulty; he had designed, with the aid of Sir Benjamin Baker, the greatest railway bridge which the world has yet seen; and ere he died he had learned that the Sudan railway to Khartoum, which he had planned and commenced in 1875, was on the eve of completion. There are few living men whose record is more closely associated than was his with some of the greatest triumphs of this century.

Born in 1817 at Wadsley Hall, Sheffield, he became at the age of seventeen pupil to Mr. J. T. Leather, the hydraulic engineer. In that capacity he was associated with many of the engineering schemes which were at that time carried out for

the water supply of Yorkshire and the surrounding districts. After an interval of two years, spent as assistant to Mr. Rastwick in the preparation of drawings and contracts for the London and Brighton railway, he returned to Mr. Leather as responsible resident engineer on the Stockton and Hartlepool railway, and was subsequently engineer, manager and locomotive superintendent of that railway. At this time young Fowler was twenty-six years of age, and had acquired experience of an unusually varied and practical kind. He started on his own account, and rapidly obtained a very considerable practice as chief engineer to a number of railways which were then passed through Parliament, notably the Sheffield and Lincolnshire and the Great Grimsby railways, which he successfully carried out. The latter railway gained him considerable reputation, so that, when the full fury of the railway mania broke forth, not only were his services eagerly sought by railway promoters, often for the most fantastic schemes, but proposals for railways all over the country were indiscriminately named after the Great Grimsby by their promoters. It was the tenth such scheme that prompted Lord Devon, the then chairman of committees, to exclaim, "What, Great Grimsby again! Go it, Great Grimsby!"

But perhaps to the general public the most interesting portion of John Fowler's work was that connected with the design and construction of the Metropolitan Railway. At the outset almost insurmountable difficulties were encountered from the opposition of vestries and owners of property, and when to these were added the discouraging prognostications of failure from many of the most eminent engineers, it is not surprising that at times the success of the scheme should have at the best appeared doubtful. Through all this the stern determination and confidence of Fowler was unshaken. When the first portion was at length opened, traffic flowed in beyond the expectations of the most sanguine. The first Act for a line from Edgware Road to King's Cross was carried in 1853, and after the financial support of the Great Western Railway to extensions at both ends had been secured a further Act was obtained in spite of strenuous opposition. It was not, however, till 1860 that capital was secured and the work commenced. After further extensions had been obtained it was decided in 1863 by the House of Lords that the railway should be continued to form a circle, connecting together all the principal termini. It is to be regretted that Mr. Fowler's scheme for a second complete circuit, which should accommodate all through goods and passenger trains without interfering with the terminal traffic, was negatived through the unfulfilled undertakings of other lines. It is not too much to say that the experience gained during the making of this railway revolutionised the ideas of engineers as to the possibilities of constructive engineering. The huge expenditure upon Parliamentary opposition, wayleaves, compensation, alteration and replacement of sewers, water and gas-pipes and other obstructions, has handicapped the paying powers of this great pioneer enterprise. But the lessons then learned and the improvements introduced by John Fowler and Sir Benjamin Baker and others who have since been associated with Fowler have rendered possible the construction of those cheaper tunnelled lines which now promise to relieve the congestion which has overtaken the street traffic. With almost all these recent schemes—for instance, the City and South London, the Waterloo and City and the Central London Railway—Sir John Fowler's name has been associated. Another great work upon which Mr. Fowler was employed was to investigate and report upon the most suitable gauge for the less important Indian railways. It will be remembered by many that in what has been called "the battle of the gauges," Mr. Fowler was always on the side of uniformity of gauge wherever possible, and it was his recommendation of a 3-feet 6-inch gauge, as compared with the 2-feet 9-inch gauge, recommended by his colleagues on the Commission, which influenced the Indian Government to choose the metric gauge, which has been so largely adopted for the lighter railways of the Indian Empire.

From Mr. Fowler's connection with India it is peculiarly interesting at the present time to turn to the part which he took in the development of Egypt under Ismail Pasha. A visit to Egypt, made in 1868 for the benefit of his health, brought him into contact with De Lesseps, who was then just completing the Suez Canal. Mr. Fowler joined a party who went to view the undertaking, and a letter which he wrote to the *Times* on that occasion was described in a leading article upon the subject as the judgment of an engineer of the highest eminence and repute. A further visit in the following year with the Prince and Princess of Wales brought him into direct contact with the Khedive, who eagerly sought his views as to the large schemes of improvement which he was then contemplating for Egypt. He became consulting engineer to the Khedive and the Egyptian Government, and in that capacity among other undertakings planned a Nile railway to run from Wady Halfa to Metammeh, and thus with water connecting links to form a junction between Cairo and Khartoum. PATENT
VULCANITE ROOFING.

Since the introduction of the patent Vulcanite Roofing into this country it has been adopted by a great number of leading architects for Public and Private Buildings, Hotels, Schools, Hospitals, Theatres, Mills, Warehouses, Breweries, Shops, Villas, Dwelling-houses, &c.

The temperature of the rooms immediately beneath the roof is more even in winter and summer than under any other roof. When properly laid repairs are never required, and all roofs are guaranteed. The roof-surface can be used as a garden, or for any other purpose. The cost of construction is less than even for a slate or tiled roof.

SHEET ASPHALTE for DAMP-COURSE, WATERPROOFING VAULTS, BRIDGES, TUNNELS, &c., is manufactured ready for use in lengths of 40 feet, and any width up to 40 inches, being more convenient than the usual damp-course slabs, and saving laps. Price lower and quality much superior to any similar article in the market.

SHEET ASPHALTE for ROOFING SHEDS, LIGHT BUILDINGS, &c., and for SARKING under slates or tiles, manufactured in five different qualities and in rolls of 15 superficial yards. It is easily laid, very inexpensive, much superior to felt roofing, and requires no annual coating

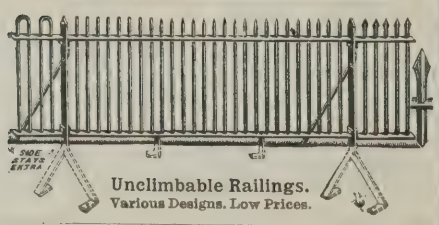
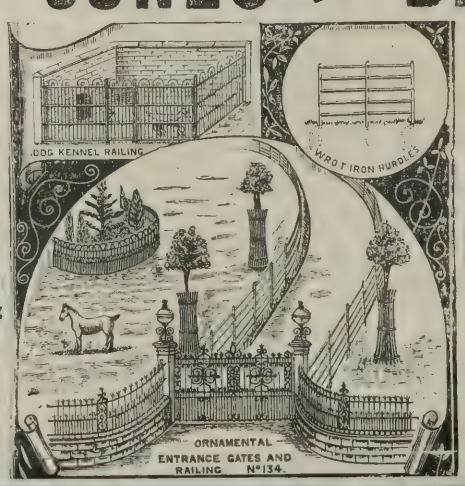
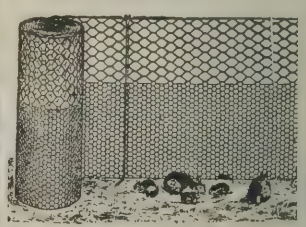
this scheme been then carried out, how many British lives, including that of the hero Gordon, and how much treasure, might have been spared. It was in consideration of his work for the benefit of Egypt that in 1885 the Queen conferred upon him a Knight Commandership of St. Michael and St. George.

Of Sir John Fowler's work upon the Forth Bridge so much has been written that any addition is here superfluous. His association with Sir Benjamin Baker in that work was only the continuation, perhaps the crowning point, of the work which they had for many years carried on together, and which has continued until death has removed the elder partner. In recognition of the greatness of this achievement, a baronetcy was in 1890 added to the honours which Sir John Fowler already possessed. He was President of the Institution of Civil Engineers in 1866, and delivered from the chair a very memorable address on the requirements of a complete engineering education. In 1890 he received the honorary degree of LL.D. from Edinburgh University.





Sir John Fowler was an ardent sportsman and was fond of deer-stalking in his extensive Scotch forests. He was also fond of yachting. His Scotch seat was Braemore in Ross-shire, for which county, as also for Inverness, he was J.P. and D.L. In 1850 Sir John Fowler married Elizabeth, daughter of Mr. James Broadbent, of Manchester, and he is succeeded in the baronetcy by his son, Mr. John Arthur Fowler, born in 1854, who was educated at Trinity College, Cambridge, married in 1878 Alice, daughter of Sir E. C. Bayley, and is J.P. and D.L. for Ross-shire.



THE BROOK HOSPITAL.

A MEETING of the Metropolitan Asylums Board was held on Saturday, when it was stated that a communication was received from the Local Government Board adverting to the managers' application for an order authorising the borrowing of a further sum of 101,830*l.* in connection with the erection &c., of the Brook Hospital; referring to a former letter, in which they commented on the fact that the architect gave directions for works entirely on his own responsibility, and stating that under these circumstances they deemed it right to omit from the order the amount due to the architect in consideration of these extra works, and that as this amount appears to be 375*l.*, the order will authorise the borrowing of the sum of 101,456*l.* instead of 101,830*l.*

The following report of the Local Government Board on the Brook Hospital was also submitted:—"It is admitted that Mr. Aldwinckle, the architect employed by the managers in connection with this hospital, under-estimated the cost of the building, &c., to a serious extent; that works which should have been included in the contracts were omitted; that as regards foundations and the substitution of fireproof floors for others, his reports were most misleading; and that he authorised deviations from and additions to the works specified in the contracts, involving a large expense, on his sole responsibility, and without any authority whatever from the hospital committee or the board of managers. The Board have not failed to consider the explanation offered by Mr. Aldwinckle, but they cannot but regard his proceedings as deserving of grave reprobation, and in the opinion of the Board he altogether failed to realise what was due to the committee of the hospital and also to the managers as the architect appointed by them. The Board are aware that a resolution was passed by the sub-committee of the managers that the architect should not incur, without the consent of the committee, any expense exceeding in one amount the sum of 50*l.* But Mr. Aldwinckle states that this was not communicated to him. The Board regard it as unsatisfactory that further evidence as to this could not be produced, in consequence of the assistant clerk who acted as clerk to the committee having left the service of the managers and being absent from England. There was either neglect in not communicating the resolution to Mr. Aldwinckle or a failure to keep a proper record of the communication addressed to him on the subject. The Board cannot, however, consider that, if Mr. Aldwinckle was not, in fact, informed of the resolution, this affords any justification for the course which he adopted. With regard to the hospital committee, the Board recognise that the members held a large number of meetings, and gave a very considerable amount of time to the duty devolving on them, and that they were not furnished by the architect with such information as they were certainly entitled to; but they regret to have to state that in their opinion there was not such supervision of the works by the committee as was desirable, and as is shown to have been necessary in order to prevent the grave irregularities on the part of Mr. Aldwinckle. With respect to the managers, the Board cannot but consider that the practice of drawing cheques for the amounts included in the certificates of the architect, without any information being furnished to them by the architect or the hospital committee as

to the works, &c., for which the certificates were given, was open to serious objection. Although on the certificates the contractors may have been entitled to have been paid the sums certified, the managers, it appears to the Board, should clearly have been furnished with information as to whether the certificates were in respect of the works included in the contract, and, if not, what were the extras or works for which certificates were given. With regard to the conclusions at which Mr. Knollys arrived on other points, the Board concur in the views expressed by him. The Board learn with satisfaction that the managers, since the period when the irregularities referred to occurred, have issued special instructions to architects and committees, and made other arrangements with regard to works. The instructions which they have adopted support the comments which the Board have deemed it their duty to make on the transactions alluded to in the report of their inspector, and they trust that by such means as have already been adopted, and otherwise, every effort will be made to prevent the occurrence in the future of irregularities such as those which are disclosed in the report."

The Chairman moved that the letter and report of the Local Government Board on the inquiry into the Brook Hospital expenditure be referred to the Brook Hospital committee, and be instructed to consider and report to the managers on the following points, which were alluded to in the letter:—(1) Supervision of building works in progress; (2) payment of contractors upon architects' certificates.

Mr. Brown, late chairman of the Brook Hospital committee, who seconded the motion, thought there was not much fault to be found with the committee. He failed to see that any committee or any board could take upon themselves the work that could only be done by the professional experts.

Mr. Brass blamed the Local Government Board for not sanctioning the purchase of another site for the hospital, and said that 70,000*l.* of the extra expenditure had been spent in consequence of the defective nature of the Shooter's Hill site.

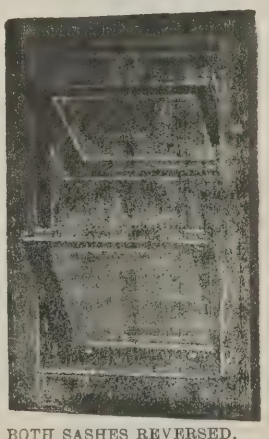
Mr. Purchase argued that there had been gross mismanagement and waste of public money in the construction of the hospital.

Mr. Strang pointed out that better sites were offered, but the Local Government Board would not give their sanction to them.

Mr. Pope, Mr. White, Mr. Helby and others having spoken, the motion was eventually adopted.

It was decided to send a copy of the Local Government Board's letter and report to Mr. Aldwinckle, the architect

WANDERING ELECTRICITY IN NEW YORK CITY.



At the meeting of the American Institute of Electrical Engineers, held on October 26 in New York, Mr. A. A. Knudson presented a paper on an electrical survey of the borough of Manhattan, New York City, showing the results of measurements of stray electric currents as indicated by differences in potential between railway tracks, underground pipes, elevated railway structures and the terminals of the Brooklyn Bridge. The experiments were first undertaken about eighteen months ago at the instance of some of the municipal officers, who were curious to know whether any current was leaking to underground pipes from the conduit of the Lenox Avenue electric conduit railway. Since that time many other tests have been made, including some but a short time ago, and the paper is a presentation of the results.

The island of Manhattan nominally has no overhead trolley railways, but as a matter of fact what is known as the Union Railway Company runs its cars over the Harlem river to the island. The set of tests were begun on the conduit railway near the power station supplying it with current. From the first unmistakable signs were encountered of railway current leakage from the rails of this line to both water and gas pipes, the sudden fluctuation of the voltmeter needle proving this beyond a doubt. The phenomenon seemed hardly explicable, however, from the known conditions of an underground electric conduit, and as the test progressed it was finally discovered that the current came from two sources. The trolley line contributed some of it, while another current passed from the water pipes to the rails, and was finally traced by means of telephone receivers placed temporarily on the cars to electric-lighting sources. Hence the author of the paper drew the conclusion, already reached by other engineers, that a system using an all-metallic insulated return, which effectually confines the current to the conductors provided for it, is much preferable to one using the ordinary ground return in large cities, where the space below the street surface is largely occupied with various lines of iron pipes, more or less subject to electrolytic action.

Another series of tests was begun at a terminal of the overhead trolley line and carried north about a mile along an

elevated railway. It was found that at the terminal the current passes into the water-pipes and elevated structure, and there is a difference of 2 to 2½ volts. A quarter of a mile further along the current all passes to the elevated structure, through which it runs for a quarter of a mile and then goes back to the water-pipe, reversing again in about half a mile. The same conditions were found to prevail on the section of the elevated railway extending about a mile in the opposite direction from the trolley terminal, although the difference in voltage is not so pronounced.

These tests were made on the west side of the island, in the neighbourhood of 135th Street and Eighth Avenue. About a year ago the trolley railway had a terminus on the east side of the island at Third Avenue and 129th Street, immediately in front of an elevated railway station. At this point there was a difference in potential averaging 2 volts, rising at times to 10 volts, between the trolley track and the nearest elevated railway pillar, and a difference of as much as 5 volts at times between the tracks and the nearest gas main. A few days ago, when workmen were engaged in removing the rails of this terminal, Mr. Knudson had a chance to observe the result of the passage of electricity from the rails to the gas pipes and elevated structure. The actual width of the base of the 70-lbs. rail when new was 4 inches, while its maximum width near the end when taken up was 2¾ inches, and the sides of the base were worn away to knife edges for a distance of several feet back from the end. Moreover, the metal ties, originally 1½ by ⅜ inch in section, have been eaten completely away in the middle, and but one was found which was whole from end to end.

In the tests made of the elevated railway structures the difference in potential between the columns and the street rails or water-pipes was generally very slight, ranging from one-thirtieth to one-fifth of a volt, and indicated that the current came from electric-lighting sources. Coming down the west side of the city, however, a full-fledged trolley current was found in the extreme lower part of the island, which was finally traced up the east side to the Brooklyn Bridge. The tests at the upper end of the island showed that an overhead trolley line using rails and water-mains for its return service can spread its influence for a distance of a mile or so in any direction through the various conduits and elevated railway structures, so it was an easy matter to trace the bridge current to the trolley roads in Brooklyn. Tests at the New York terminal of the Brooklyn Bridge showed that its superstructure was in some places as much as three volts positive to the rails of the adjoining cable railway. The existence of these currents naturally led to a consideration of their effect on the bridge, particularly on the anchorages. A large number of tests were made, which are believed to show that no damage as might be expected from the electric corrosion of pipes in other cities has taken place on this structure.

PATENTS.

[*This List of Patents is compiled specially for this Journal by Mr. G. H. Rayner, of the firm of Rayner & Co., Consulting Patent Agents, 37 Chancery Lane, London, W.C., from whom all particulars and information relating to Patents may be had gratuitously.*]

Applications for Patents.

23508. Thomas Potter, for "Improvements in the construction of fireproof buildings."

23543. Paul Guenther Ludwig Stuhlmann, for "Improvements in and relating to grooved tiles."

23652. John Boland Atkinson, for "Improved process for making bricks, tiles, pipes and such like from oil shale."

23758. Peter Stuart Brown, for "Improvements in the manufacture of multiple ply veneer and in the production of roofing-plates and other articles therefrom."

23856. George Morgan, for "Improvements in the manufacture of glazed tiles and bricks."

Specifications Published.

26530. Dargue, Griffiths & Wright, for "Apparatus for heating buildings and the like by means of hot fluids or electricity."

30869. Rutnagur, for "Ventilation of buildings."

102. McGrouther, for "Fireproof doors."

To Inventors.—Patents for Inventions, Trade-marks and Designs secured; every assistance given to inventors. Specialists in Building matters. Information free.—Messrs. Rayner & Co., Patent Agents, 37 Chancery Lane, London, W.C.

THE WEEK.

When it was lately decided in the Court of Appeal that a ship was not premises under the Workmen's Compensation Act it was supposed there would be a limitation of cases. But from a judgment given on Saturday that expectation is not likely to be confirmed. The plaintiff in the action was a carter in the employment of Messrs. Brown, Backhouse & Co., Liverpool. The plaintiff was engaged in arranging timber in a cart outside defendants' premises. He was waiting for some bolts in order to complete the load. A piece of timber somehow tilted and threw him on the road, and he subsequently died from the injuries he received. When an action was brought in a local court under the Workmen's Compensation Act the widow was awarded 243*l.* 12*s.* 7*d.*, the county court judge holding that the premises were a factory, and that the accident arose out of the man's employment on or about a factory. The defendants appealed. Their contention was that the deceased's employment was not employment "on or in or about a factory" within the meaning of section 7, subsection 1, of the Workmen's Compensation Act, for the man was employed as a carter and was at the time of the accident in charge of a cart which was outside the defendants' factory. His employment was clearly not on or in the factory. Neither, according to the true construction of the section, was it about the factory. The word "about" ought not to be limited as being simply equivalent to "near." It meant near and in the business of the factory. The Court of Appeal took the same view as the county court judge, holding that the Legislature obviously thought that the word "on" would not include all that they intended to include, neither was the word "in" sufficient; they therefore added the word "about," which was clearly an enlarging word. The question was really a question of fact, and the county court judge had found that the employment of the deceased was on or in or about a factory. The appeal was dismissed. The decision of the Court of Appeal will hardly be confirmed by business men. It is a very common expression to say of a man, "He is about somewhere," which means that he may be in one of the spaces between workshops or buildings, or within a building. The expression is not used to signify beyond the walls of premises. In the case in question the cart was close to the premises, but it might have been at the end of the street or in an adjoining street. We do not profess to have a clearer notion of the intention of the Legislature than the Court of Appeal. All we can say is that "about" in general acceptation has not the meaning given to it by their lordships.

An instructive paper on "The Effect of Subsidence due to Coal-workings upon Bridges and other Structures" was read by Mr. S. R. Kay at the meeting of the Institution of Civil Engineers on Tuesday. When designing such structures it was, he said, necessary to know, first, the principles of subsidence following the working of coal, to determine the position and character of the works; secondly, an approximation to the area necessary to be left unworked for the protection of the same; and thirdly, how the design may be suited to the supposition that the coal may afterwards be worked without any solid pillar being left for support. Subsidence always followed coal-working where no pillars were left, and was generally proportionate to the thickness of material excavated. Subsidence around pillars left for support was shown to be most irregular in its action, and all rules on the subject were of an empirical character. If absolute immunity was to be secured an ample pillar should be left. A period of two years or three years at least, after the coal was extracted, should elapse before commencing works, and more if possible in the case of deep mines. In building ordinary road or railway bridges or viaducts, the form of the arch should be avoided and steel superstructure employed, having the requisite elasticity to adapt itself to any slight movement subsequent to erection. Waterworks and reservoirs, where certain heights above sea level were to be maintained, should not be constructed in mining districts unless the suitability of the site outweighed the cost of protection. Bridges with strong well bonded abutments and wings and steel superstructure were frequently worked under, and sustained little or no damage, especially in the case of deep mines. Where, therefore, they must be built over an area to be subsequently mined, the girders should have a good bearing upon the beds. The subsidence to be expected, amounting to about two-thirds of the thickness excavated, should, if necessary, be provided for in the first height of the bridge, otherwise provision should be made for the eventual raising of the superstructure to its former level if required. Lofty viaducts should be protected by pillars, and lower structures should be built as indicated. The piers should be solid, and should not be pierced by an arch.

It is to be hoped there will not be many incidents like that which occurred in St. Clement's Church, Belfast, on Tuesday, otherwise the position of builders will become difficult to understand. In that church, as elsewhere, there is a difference of opinion about the manner of conducting services. A contractor received orders to remove several objects which one party did not admire, and as the rector would not hand over the key of the building, the workmen, it is said, forcibly opened a side door. They then set about removing the rood-screen, pulpit, reading-desk and the retable over the Communion table, while the chancel railings and supports were cut away and bodily removed. The crosses on the porch and over the east window on the outside were cut down. Four constables were on duty during the operations, and one of the churchwardens was present. It is said in France there is nothing sacred to a sapper, but we should not like it to become a proverb that a builder has no reverence for work in churches. The question of responsibility in such cases is not clear, and it might happen that the courts would hold the builder to be accountable. In this case it is said the rector intends to take proceedings against those who forced their way into the building, and if, as is stated, he had already made arrangements with another contractor to remove anything which could be considered as irregular, the lawsuit will become rather complicated and therefore costly.

Madame Garnier, the widow of Charles Garnier, has given another example of her own generosity, and of her desire to perpetuate the reputation of her husband. We have already mentioned the gift of medals to the Ecole des Beaux-Arts. Now several pictures which belonged to the architect have been presented to the Musée of Saint-Calais. It was generally supposed that Charles Garnier was a native of Paris, but the reason given for selecting Saint-Calais is that it was his native town. Among the pictures are a *Belle Jardinière*, by Bal; *Fountain in the Environs of Rome*, by Benouville; *View from the Garden of Garnier's Villa at Bordighera*, by Th. Ballu; *A Shepherd of the Roman Campagna*, by A. de Curzon; *Abduction of a White Girl by a Red Indian*, by Saintin; *Interior of the Church of St. Germain des Prés*, by Chaperon; a *Monk's Head*, by Cabanel; *Head of a Man*, by Alaux. In gratitude for so valuable a gift, the Municipal Council has decided to subscribe liberally to the fund for the erection of a memorial of Charles Garnier.

The new school of music which was lately opened in Moscow would appear to be intended not merely for teaching or practising, but for a testimony to the union of the arts. It is constructed in a costly style. In all the classrooms the utmost precaution is taken to prevent sound from passing beyond the walls. The double floors are rendered sound-proof by a packing of felt, cotton and flax. The concert-rooms, whatever their capacity, are adorned with wall-paintings and sculpture. The largest accommodates 2,000 auditors, and the vault contains a representation of St. Cecilia surrounded by bands of angelic musicians. An immense bust of Rubenstein is another feature in the concert hall, and there are few famous composers whose portraits or busts are not found in the building. The walls of the foyer have marble plaques on which the names of successful students will be engraved. In costliness there is no building of its class which is comparable with the Moscow school.

WESTMINSTER IN NOVEMBER.

THERE are districts in London which correspond with those of other cities, but engineering Westminster is unique. Why have such crowds of all varieties of civil engineers settled down about the Abbey? There is no profession or business so closely connected with finance. An individual can give a commission for a building, or a row of them, but it requires several individuals to raise the funds which are necessary for a railway, a harbour, waterworks or gasworks. Apparently, therefore, engineers should keep close to company promoters and have their offices near Lombard Street. Important as is the raising of funds, it is, however, an operation which is simple if compared with the obtaining of an Act of Parliament. Almost daily it is revealed how easily people can be persuaded to risk their fortune in financial schemes of which they know nothing, but the most eloquent counsel, the shrewdest Parliamentary agents, the skilfullest members of the Institution of Civil Engineers combined cannot be sure of the passing of a Bill in which they are concerned—nay, a slight irregularity may prevent it from being read once in either House of Parliament. That element of uncertainty makes it necessary for all whose business is connected with the promotion of private Bills to be within call of the Parliamentary committee-rooms and offices. Half an hour's delay in the appearance of a witness or the production of a document might cause a preamble to be declared as not proved, and in consequence an outlay of thousands of pounds would become useless. For it must always be remembered there can be no postponement of Parliamentary proceedings. If a scheme cannot be followed out to the end in one Session, all the evidence, plans, estimates, &c., cease to have value, for the whole operations must be commenced in a succeeding Session as if the scheme was heard of for the first time.

To the uncertainty which is characteristic of Parliamentary work must be added the extreme haste which the conditions impose. There are speculators who look forward through a long term of years in patience awaiting that ripeness of time which is necessary to bring about a satisfactory result. Sir William Vernon Harcourt was once "floored" by a genius of that kind. He had not long obtained "silk" and was anxious to display his ability to lead. One of the witnesses for a harbour in some out-of-the-way place with an unpronounceable name in Wales, had declared it was the finest site for a harbour in the world. "May I ask," said Mr. Harcourt in cross-examination, "what place you described last year as the most suitable for a harbour in the world?" The witness coolly mentioned another site with a long name. Counsel then asked him to give those he preferred on many preceding occasions, and was answered correctly in the most cheerful manner. "Now," said Mr. Harcourt, stretching himself to his full length and speaking in loud tones, "you say it is so and so which is to be preferred; tell the committee what place will next year be said by you to be the finest site for a harbour in the world?" The witness supplied the name without a second's hesitation. There was a roar in the room, in which the committee joined, and the cross-examination collapsed. Whether the Bill passed we forget, but such sublime audacity on the part of a witness at least deserved that reward. In the majority of cases it is not considered wise to take any important step in the promotion of a Bill until November approaches. If, for instance, plans were prepared at an earlier period it would be easy by knocking down or building a small cottage or a few fences to make the plans incorrect. They are supposed to represent everything that exists on the ground selected for the proposed works at the end of November. Then again, if a route were divulged an opposition scheme could be started, and although the promoters might be bought out, that is always a humiliating expenditure of money. Parliament in its wisdom has practically limited the most important operations to November, and although the efforts to produce the documents required for compliance with standing orders are often exhausting to all engaged in them, yet the arrangement has many advantages in its favour.

Let us suppose, then, a Bill for a new railway (the rules are uniform for most classes of work) is to be introduced in the coming Session. If the promoters are a company already existing there need be no question about alternative courses. In such a case the directors know what is the general desire in the district which is to be served, and the direction of the line is determined beforehand. It may be necessary to avoid approaching one or more towns too closely through fear of opposition from landed proprietors. Elsewhere there cannot be an excess of proximity. It used to be said that Sir John Rennie's system was to draw a straight line from town to town and tell his assistants to follow that course. The direction of the South-Eastern between Ashford and Redhill supports the theory. But in our days more circumspection is demanded. In a line that is to be got up by a new company or by a few speculators economy of construction has to be considered, and to it questions relating to gradients and curves have to succumb. The first necessity is to determine the course of a line with sufficient precision to enable the earliest of the necessary notices to be published in sufficient time. That could be done in an emergency before the survey or section is started.

The standing orders, happily, are not too exacting about plans. The Ordnance Survey, although it is not acceptable in the Law Courts unless in few and peculiar circumstances, is considered to be sufficiently trustworthy to be a basis for Parliamentary plans. But it must be brought up to date by the railway engineers. Every field or enclosure is required to be distinctly marked and numbered, and as on a scale of 4 inches to a mile, or 1,320 feet to an inch, buildings or groups of buildings could only be discerned by a microscope, plans on a larger scale have to be provided. Parish, borough, district and county boundaries are also to be marked. The engineering difficulties are not always manifest on the small-scale plans, and the fight over them has to be supported by some of another kind. What the Parliamentary plans are to supply is information about the properties which will generally be affected by the proposed operations. Suppose there is a tunnel a couple of miles in length through rock which abounds in faults, two straight lines will adequately represent it on the section. A big bridge of one span across a river would appear no less simple. But in dealing with the narrowest public road it is necessary to suggest the kind of structure that will be erected and to show the new approaches and their rate of inclination. In the preliminary stages of the Parliamentary campaign it does not matter whether a tunnel or a bridge is an impossibility, but, strange as it may sound, the battle might be lost by neglecting to clearly mark a few poultry-houses or wood sheds on a plan. Everything of the nature of a fixture must be numbered or linked with something numbered, and the omission of a small ~ therefore is a ground for an allegation. The Parliamentary work of every November has not only to be accomplished in a rush, but those who undertake it are assured it will be scrutinised by eyes which are inimical to it, and that profit can be made out of trifling oversights, if anything connected with property or Parliament can be called trifling.

The difficulties impart fascination to Parliamentary surveying. This is evident from the desire to share in it. If an engineer were to be found early in the month who had returned for a holiday, or for consultation from some of the great works in South America or elsewhere, where he had the disbursement of millions, he would take it as a favour to be invited to prepare a section of a new line. The work seems to rejuvenate old stagers. The most potent, grave and reverend notabilities of the Institution consider they are qualified for scampering over fields with a spirit-level. An assistant who would suggest that a President or ex-President had become too stiff to cross hedges and ditches on a November day would have little chance of promotion or support. There are so many associations with the season it is no wonder the interest is abiding. November is the English engineers' springtide. To be able to produce plans which will stand the tests imposed on them is a victory, and all who have taken part in it may well be proud. Then, if the Bill passes the ordeal of committee-rooms and becomes law, there are working plans and sections to be prepared, designs to be got out for bridges and other structures, contracts to be arranged, and for some of the staff works to be carried out. Everybody is sanguine of success at least during November, and trustful that the scheme then undertaken is the forerunner of many others.

It is thus easy to understand why in the early days of November there is a good deal of satisfaction in Westminster offices. There are men who, from being independent, only remember they are engineers at that time. To them Parliamentary work is a pleasure which has an interest that is wanting in shooting or hunting. To others an engagement may have an almost vital importance, for in engineering, as in many professions, there are men who are impelled by necessity, and work for four weeks at a liberal rate—even if no other follows—gives relief in the present and hope for the future. In some offices strangers are rarely employed, while elsewhere the surveying and levelling may be entrusted to outsiders.

Whatever are the arrangements, the engineers who are engaged depart from Westminster to their field work in the best of spirits. If they could be assured of dry weather the prospect would be cheering. But apart from the personal discomfort, it is tormenting to be plotting a survey in a continuous downpour, for if possible plans should be made ready on the spot for copying in town. Levelling is also difficult when the glasses are obscured by wet, and on a dark day the "sights" have to be more frequently taken than is desirable in expeditious work. At one time it is sometimes said, attacks were to be apprehended from hosts gathered by discontented landowners, but the majority of those stories are apocryphal. In our time people are in general too willing to dispose of land, and those who spoil landscapes by announcements of remedies for all the ills that flesh is heir to cannot grumble about the appearance of embankments. The rate of progress in the field is anxiously watched in Westminster, not only by the engineer who is responsible, but by the lithographer who is to prepare the plans.

It may not be generally known that by some firms lithographic draughtsmen are not allowed to leave the premises during a fortnight or even a longer term in November. They have to sleep as well as take their meals in discomfort. But as plans often arrive in fragments it is necessary to despatch them without a minute's unnecessary delay. The part taken by lithographers in Parliamentary battles is of great importance; they are often treated with little consideration, as if the work were only mechanical. And yet it is manifest that if errors are committed they may be overlooked in the hurry and excitement of the last days of November, and with fatal results to the schemes.
